Twelve—All German troops at present in any territory which before the war belonged to Russia, Rumania or Turkey, shall withdraw within the frontiers of Germany as they existed on August 1, 1914.

Thirteen—Evacuation by German troops to begin at once, and all German instructors, prisoners, and civilian as well as military agents now on the territory of Russia (as defined before 1914) to be recalled.

Fourteen—German troops to cease at once all requisitions and seizures and any other undertaking with a view to obtaining supplies intended for Germany in Rumania and Russia (as defined on August 1, 1914).

Fifteen—Abandonment of the treaties of Bucharest and Brest-Litovsk and of the supplementary treaties.

Sixteen—The Allies shall have free access to the territories evacuated by the Germans on their eastern frontier either through Danzig or by the Vistula in order to convey supplies to the populations of those territories or for any other purpose.

III.—Clause Concerning East Africa

Seventeen—Unconditional capitulation of all German forces operating in East Africa within one month.

IV.—General Clauses

Eighteen—Repatriation, without reciprocity, within a maximum period of one month, in accordance with detailed conditions hereafter to be fixed, of all civilians interned or deported, who may be citizens of other allied or associated states than those mentioned in Clause Three, Paragraph Nineteen, with the reservation that any future claims and demands of the Allies and the United States of America remain unaffected.

Nineteen—The following financial conditions are required: Reparation for damage done. While such armistice lasts, no public securities shall be removed by the enemy which can serve as a pledge to the Allies for the recovery or reparation for war losses. Immediate restitution of the cash deposit in the national bank of Belgium, and in general immediate return of all documents, specie, stocks, shares, paper money, together with plant for the issue thereof, touching public or private interests in the invaded countries. Restitution of the Russian and Rumanian gold yielded to Germany or taken by that Power. This gold to be delivered in trust to the Allies until the signature of peace.

V.—Naval Conditions

Twenty—Immediate cessation of all hostilities at sea and definite information to be given as to the location and movements of all German ships. Notification to be given to neutrals that freedom of navigation in all territorial waters is given to the naval and mercantile marines of the allied and associated Powers, all questions of neutrality being waived.

Twenty-one—All naval and mercantile marine prisoners of the allied and associated Powers in German hands to be returned without reciprocity.

Twenty-two—Surrender to the Allies and the United States of America

of one hundred and sixty German submarines, (including all submarine cruisers and mine laying submarines,) with their complete armament and equipment in ports, which will be specified by the Allies and the United States of America. All other submarines to be paid off and completely disarmed and placed under the supervision of the allied Powers and the United States of America.

Twenty-three—The following German surface warships, which shall be designated by the Allies and the United States of America, shall forthwith be disarmed and thereafter interned in neutral ports, or for the want of them, in allied ports, to be designated by the Allies and the United States of America, and placed under the surveillance of the Allies and the United States of America, only caretakers being left on board, namely: Six battle cruisers, ten battleships, eight light cruisers, including two mine layers, fifty destroyers of the most modern type. All other surface warships (including river craft), are to be concentrated in German naval bases to be designated by the Allies and the United States of America, and are to be paid off and completely disarmed and placed under the supervision of the Allies and the United States of America. All vessels of the auxiliary fleet, trawlers, motor vessels, &c., are to be disarmed.

Twenty-four—The Allies and the United States of America shall have the right to sweep up all mine fields and obstructions laid by Germany outside German territorial waters and the positions of these are to be indicated.

Twenty-five—Freedom of access to and from the Baltic to be given to the naval and mercantile marines of the allied and associated Powers. To secure this the Allies and the United States of America shall be empowered to occupy all German forts, fortifications, batteries and defense works of all kinds in all the entrances from the Cattegat into the Baltic, and to sweep up all mines and obstructions within and without German territorial waters, without any question of neutrality being raised, and the positions of all such mines and obstructions are to be indicated.

Twenty-six—The existing blockade conditions set up by the allied and associated Powers are to remain unchanged, and all German merchant ships found at sea are to remain liable to capture.

Twenty-seven—All naval aircraft are to be concentrated and immobilized in German bases to be specified by the Allies and the United States of America.

Twenty-eight—In evacuating the Belgian coasts and ports, Germany shall abandon all merchant ships, tugs, lighters, cranes and all other harbor materials, all materials for inland navigation, all aircraft and all materials and stores, all arms and armaments, and all stores and apparatus of all kinds.

Twenty-nine—All Black Sea ports are to be evacuated by Germany; all Russian war vessels of all descriptions seized by Germany in the Black Sea are to be handed over to the Allies and the United States of America: all neutral merchant vessels seized are to be released; all warlike and other materials of all kinds seized in those ports are to be returned and German materials as specified in Clause Twenty-eight are to be abandoned.

Thirty—All merchant vessels in German hands belonging to the allied and associated Powers are to be restored in ports to be specified by the Allies and the United States of America without reciprocity.

Thirty-one—No destruction of ships or of materials to be permitted before evacuation, surrender, or restoration.

Thirty-two—The German Government will notify the neutral Governments of the world, and particularly the Governments of Norway, Sweden, Denmark, and Holland, that all restrictions placed on the trading of their vessels with the allied and associated countries, whether by the German Government or by private German interests, and whether in return for specific concessions, such as the export of shipbuilding materials or not, are immediately cancelled.

Thirty-three—No transfers of German merchant shipping of any description to any neutral flag are to take place after signature of the armistice.

VI.—Duration of Armistice

Thirty-four—The duration of the armistice is to be thirty days, with option to extend. During this period, on failure of execution of any of the above clauses, the armistice may be renounced by one of the contracting parties on forty-eight hours' previous notice.

VII.—The Limit for Reply

Thirty-five—This armistice to be accepted or refused by Germany within seventy-two hours of notification.

CAPRONI'S PLANS FOR 18,000 HORSE POWER CAPRONI AIR CRUISER MADE KNOWN AT AERO CLUB OF AMERICA ANNUAL MEETING

IT was announced on November 11th, at the annual meeting of the Aero Club of America, that Mr. Gianni Caproni, the famous Italian aeroplane constructor, is planning to construct an air cruiser of the aeroplane type, with a number of motors aggregating 18,000 horsepower.

The armistice having lifted the ban on the discussion of coming aeronautic developments, the Transatlantic Flight Committee of the Aero Club of America, of which Mr. Henry A. Wise Wood is chairman, made known the fact that there are several aeroplanes already being designed, each to be equipped with 5,000 horsepower. Caproni has one such machine, and it was in connection with the discussion of this type that it became known that Caproni has an 18,000 horsepower air cruiser under consideration, which will be capable of carrying a large number of passengers in non-stop flights across the Atlantic.

The famous British constructor, Handley Page, is also planning to manufacture a 5,000 horsepower machine, and similar plans are under consideration in the United States.

The Aero Club of America received an offer from Mr. Harry N. Atwood, the veteran aviator, who, representing a group of prominent patriotic men, offer to pay the expenses of constructing a Transatlantic air cruiser for the Aero Club of America.

Officers Re-Elected by 1,000 Votes

The present officers of the club were re-elected, 1,000 votes being cast for them, and there being no opposition. The officers elected are as follows:

President, Alan R. Hawley; vice-president, Henry A. Wise Wood; second vice-president, Godfrey L. Cabot; third vice-president, Rear Admiral Bradley A. Fiske; fourth vice-president, Charles Jerome Edwards; governors, Class A, term expiring 1922, Lt. Col. James A. Blair, U.S.A.; Henry Woodhouse; Allan A. Ryan; Rear Admiral Bradley A. Fiske; Class A, term expiring 1921, William Hawley; governors, Class B, Major Albert B. Lambert, U.S.A.; Henry B. Joy; Lieut. Godfrey L. Cabot, U.S.N.; George M. Myers; John Hays Hammond, Jr.; Alberto Santos-Dumont; Brig.-General Robert K. Evans, U.S.A.; Major Max C. Fleischmann, U.S.A.; treasurer, Lieut. Col. Charles Eliot Warren.

General Pershing, Vice-Admiral Sims, and Postmaster General Burleson were elected honorary members of the club.

Letters were received from the highest military and naval authorities in the United States and overseas, including Admiral Sims, praising the patriotic work of the club and its officers.

So-Called "Opposition" Could Not Muster 100 Proxies in Four Months of Efforts

The so-called "opposition" presented 67 proxies, some dated as early as July and September, but on checking these proxies it was found that some of the signers had notified the secretary of the club since that they had signed them under a misunderstanding, not knowing that the names of prominent sportsmen used in the so-called opposition were used without their authority and had since voted for the regular ticket. Others invalidated their former proxies when they found by the annual report the enormous amount of patriotic work which the present management of the club had done and voted for the present administration. The secretary of the so-called opposition requested permission of those present to withdraw the so-called opposition ticket. This was granted.

Aero Club Has 1,960 Members and Has Issued 5,000 Pilot Certificates

Major F. L. V. Hoppin, chairman of the membership committee, reported that the club has 1,960 members and has gained close to one thousand members during the past year. The club's service flag has over one thousand stars, every military member in the service being a commissioned officer and every civilian member in the service holding a position of importance.

Mr. Alan R. Hawley, chairman of the Contest Committee, reported that the club has issued over 5,000 pilot certificates. Other reports showed that an enormous amount of patriotic and constructive work was done by the club during the past year.

The summary of the important work done and planned covered forty closely typewritten pages and lack of space prevents AERIAL AGE from printing it. It covers the activities of the club in the United States and overseas, and work for winning the war as well as for the development of aeronautics for peaceful purposes and to provide employment for aviators after the war.

THE HUGHES AIRCRAFT REPORT

(Continued from last week)

FOURTH—THE AIRCRAFT PROGRAM

At the time of our entry into the War we had no combat planes, and only a few planes for training and scouting purposes. Approximately 100 aeroplanes had been delivered to the Army up to the year 1917. There were few flyers and still fewer who had any acquaintance with aviation engineering. The aeroplane manufacturing industry was in its infancy in this country. But these difficulties were not concealed. The necessity of prompt endeavor to surmount them and of securing at once the full benefit of foreign experience was obvious.

On May 22, 1917, the Joint Army and Navy Technical Aircraft Board, consisting of officers of the Army and Navy especially qualified by reason of aeronautical experience, made a series of recommendations to the Secretary of War and the Secretary of the Navy, which were duly approved by each Secretary. It was recommended that there should be purchased by the Army (from the Curtiss Aeroplane and Motor Corporation) "700 Curtiss JN-4 advanced training planes, equipped with the Curtiss OX-5 engines, with 50% extra engines and appropriate amount of engine and aeroplane spares." The purchase of 100 Gnome engines (40 for the Navy and 60 for the Army) from the General Vehicle Company was also advised. It was recommended "that no action be taken on the suggestion by the Aircraft Production Board for the purchase of the Standard J aeroplanes, pending tests of this machine by Army flyers." Other recommendations were as follows:

"9. The Board recommends that the Aircraft Production Board take immediate steps to obtain complete working drawings, complete machines for use as samples, and to arrange for the manufacture in this country of the following aeroplanes and engines:

AEROPLANES.

Sopwith, 1½ strutter.
Spad, 1-place pursuit type.
S. E. 5, 1-place pursuit type.
Sopwith, 130 H. P. Clerget, 1-place pursuit type.
D. H. 4, 2-place reconnaissance.
B. E. 2 D, 2-place reconnaissance.
White, Gnome pusher, seaplane.
Two types of Fairey seaplanes; 130 H. P. Clerget type and also a Campania type.
Farman, with a 150 H. P. Hispano Suiza engine, seaplane.

ENGINES.

Lorraine-Dietrick, 250 H. P.
Clerget, 130 H. P.
Hispano Suiza, 200 H. P.
Rolls-Royce, 270 H. P.
B. H. P. 200 H. P.
Gnome Mono-soupape, 170 H. P."

The same Board on May 23rd made further recommendations to the Secretary of War and Secretary of the Navy, which were also approved, as follows.

"3. It is estimated that the needs of the United States Army for heavier-than-air aircraft until July 1, 1918, will be as indicated hereinafter and it is recommended that a building program to accomplish these needs be started at once.

Under the present conditions in order to meet the needs of the United States Army only.

Type of Aeroplane	Number Required	Type of Engine	Number Required
J. N.-4	3,500	OX-5	7,000
DeH.-4	1,750	R-R or equivalent	3,500
S E-5	600	H-S	1,200
S.P.A.D.	600	H-S	1,200
Sopwith	600	Clerget 130	1,200
J. N.-4 (Stop gap order)	0	Hall-Scott A-7-a	1,000

In the event that the United States are called upon to train foreign flyers in addition to United States Army flyers.

TRAINING

Type of Aeroplane	Number Required	Type of Engine	Number Required
J. N.-4	5,000	OX-5	10,000
DeH.-4	2,500	R-R or Equivalent	5,000
S E-5	800	H-S	1,600
S.P.A.D.	800	H-S	1,600
Sopwith	800	Clerget 130	1,600

* * * * * * *

"6. It is recommended that the Aircraft Production Board of the Council of National Defense take steps immediately to advise concerning the formulation of the plans how best to obtain in this country the following aeroplanes and engines with the designs of these aeroplanes and engines and the rights to manufacture them in this country.

AEROPLANES.

Type	Number	Type	Number
DeH.-4	2	R-R	4
S E-5	2	H-S	4
S.P.A.D.	2	H-S	4
Sopwith 1½ strutter	2	Clerget 130	4
B E 2 C	2	R A F	4
Farnam seaplane	2	H-S	4
Martinsyde	2	R-R-190	4
Sopwith	2	Clerget 110	4
Handley-Page twin	4	R-R	16
Caproni	2	C U R 92 Rh 110	4
Savoya	2	With engine	4
Savoya	2	With engine	8

"7. In addition all such modern German aeroplanes complete with engines as it may be possible to obtain. These may be obtained either from the allies or from Holland.

"8. ADDITIONAL ENGINES DESIRED.

4 Lorraine-Dietrick, 250 H. P.
3 Clerget, 130 H. P.
2 Hispano Suiza, 200 H. P.
3 Rolls-Royce, 270 H. P.
2 B. H. P., 200 H. P.
4 Gnome Mono-soupape, 170 H. P."

Report of Aeronautical Commission

Two months after we had entered the War, an Aeronautical Commission was sent to Europe. This Commission, which sailed on June 17, 1917, in charge of Major (afterwards Colonel) R. C. Bolling, was composed of Army and Navy experts and civilians. Captain Virginius E. Clark and Captain Edgar S. Gorrell represented the Army, and Navy Constructor G. C. Westervelt and Lieutenant Warren G. Child represented the Navy.

Major Bolling's report was sent from Paris on August 15, 1917. The governing principle for the American Production program was stated by Major Bolling to be:

"First. The United States must first provide itself with all aeroplanes and engines required for training purposes in America.

"Second. The United States must next provide the aeroplanes and engines necessary for use strictly in connection with the operation of American forces in the field. It is best known in Washington what will be the size and composition of the American forces in the field at any given dates in the future. You have the information as to the number of types of aeroplanes required in direct connection with military operations of these forces. We have learned nothing to change the views on that matter which were held by Major Foulois when we left Washington.

"Third. After these first two considerations comes the American programme of putting into the field next year air forces in excess of the tactical requirements of its army in France. It is greatly desired that the United States shall do this. Such air forces should consist of fighting aeroplanes and bombers." (Then follows a statement of the proportions deemed advisable.)

The conditions of European production were described; and the advisability of obtaining through foreign orders the supply of aeroplanes and engines required for use at the front and in training abroad for a period extending to July 1, 1918, was strongly emphasized, as is shown by the following extract from the report:

"In our opinion these American needs may be divided into two periods: First period, from the present time to July 1st, 1918. Second period, subsequent to July 1st, 1918. With every confidence in the ultimate performance of the American production program our investigations of production experience over here and of the sea tonnage situation have convinced us that aeroplanes and engines produced in America cannot be actually delivered at the front in any great quantity prior to July 1st, 1918. Subsequent to July 1st, 1918, we believe that American production will not only take care of our needs, but may become a large factor in maintaining the air forces of our Allies. In considering the period between now and July 1, 1918, due weight must be given to the experience of all foreign countries and manufacturers in the delays in aeroplane and engine production which were not and could not be foreseen. Only at close hand can one appreciate how many and how great those delays have been. . . .

"After long and careful consideration of this subject, we and all others here have come to the very strong conviction that most of the aeroplanes and engines for American use at the front and for our training here between now and July 1st, 1918, must be produced either in France or Italy where effective and successful methods of production are already in full operation. Because we consider this imperative and absolutely essential to prevent failure of our air campaign next year, an arrangement has been made with the French Government under which they are to produce for us the aeroplanes and engines shown on the attached table which also includes a schedule of guaranteed deliveries. . . .

"You will also find annexed a schedule of approximate prices of these aeroplanes and engines and a draft of the proposed agreement between the American and French Government which is now in the final stages of execution, although the orders have been actually placed by the French Government with its manufacturers. This agreement has been prepared after conference with the Judge Advocate General and his staff here and considerations of the arrangements under which England is having engines built in France." . . .

FOREIGN ORDERS

Accordingly Major Bolling reported that the following orders had been placed abroad:

IN FRANCE.

TRAINING AEROPLANES.

725 Nieuports with Le Rhone engines and 150 Spads with Hispano engines. Deliveries to be in time to meet U. S. training program in France.

SERVICE AEROPLANES.

	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May	June
1500 Breguet (Renault & Fiat)	60	60	460	460	460			
2000 SPAD (200 HP Hispano)				135	300	400	550	615
1500 New Spad (150 Gnome) or 1500 Nieuport (150 Gnome)			50	100	200	300	350	500
			300	400	400	400		

SERVICE ENGINES.

	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May	June
1500 Penault (300 HP)	60	60	460	460	460			
4000 Hispano (200 HP)			135	375	565	755	945	1225
3000 Gnome (150 HP)			400	400	400	600	600	600

IN ITALY.

500 S. I. A. 6 B (reconnaissance and day bombing aeroplane similar to the Breguet). Deliveries to begin October and be completed in December.

200 to 300 Caproni Biplane with the new Isotta-Fraschini engine. Deliveries prior to June 30, 1918.

A formal contract was made between General Pershing and the French Government under date of August 30, 1917, for the 5,000 service planes and 8,500 engines above described. The French Government entered into this contract upon the express condition that the United States should furnish the machine tools and raw materials which were fully listed. In order to perform this condition, a contract was made under date of October 4, 1917, by the United States Government with The J. G. White Engineering Corporation, by which the latter was to act as an agent for the purchase of the required materials on the basis of cost plus three per cent. as compensation. It turned out that there was great difficulty in obtaining these materials as the French specifications in important instances could not be met at the time by American manufacturers. While the contract with the French Government called for deliveries of materials for planes two and one-half months before delivery of the finished planes, and materials for engines three and one-half months before delivery of finished engines, and that all materials advanced by the French Production Service should be replaced not later than November 1, 1917, it appears that only 14 per cent. of the required materials had been placed at points of embarkation in the United States by November 1st, for shipment to France, 46 per cent. by January 1, 1918, and 67 per cent. by March 1, 1918; 91 per cent. was delivered at points of embarkation by June 1, 1918, and 99 per cent. before the end of August. From information recently received it appears that all materials shipped under the contract arrived safely in France and that substantially all have been satisfactory as to quality. For the materials thus delivered during the fiscal year ending June 30, 1918, there had been paid to The J. G. White Engineering Corporation $9,005,074.31, of which $8,742,412.29 represents the purchase price and $262,662.02 the agreed compensation.

It is understood that in December, 1917, in view of the existing conditions, and the serious need for aeroplanes on the part of the French, the original contract was modified by a new contract calling for about one-quarter of the deliveries within the period contemplated in the first contract. The exact terms of the second contract are not now available here. It is also understood that further orders were placed with the French Government from time to time.

The deliveries originally contemplated on the foreign orders were not made; most likely by reason of the delays on the part of the United States in furnishing the required materials and the increased pressure of the needs of the Allies.

Deliveries on Foreign Orders

Up to February 1, 1918, it appears that only about 600 planes had been received under the orders placed with the French Government, of which only about 70 were fighters and bombers. The situation as it then existed is disclosed in the cable from General Pershing under date of February 16, 1918:

"P. 610, Paragraph 1-A. Dated Feb. 16, 1918.

"Conference to-day between Chief of Air Service A. E. F. and French under Secretary of State for aeronautics develops fact that due to non-arrival in France of sufficient raw materials French production of aeroplanes and engines is insufficient to meet needs of French and American air service during the next three months. 9 American squadrons will be available for front line service next month and if military necessity requires that they be put into front line service several of these squadrons must be equipped with inferior types of aeroplanes purchased from the French Government, a procedure which is strongly disapproved. Urgently important every effort be made to expedite remainder shipment of J. G. White & Co. materials destined for France,—almost 14,000 tons, and also urgently request no delay in shipment of service aeroplanes from the United States. Pershing."

Plight of Our Cadets Abroad

There may also be noted at this point the serious delays which occurred in securing adequate provision for the training of American cadets abroad. Hundreds of these cadets were held at concentration camps and other places for several months without suitable training. This was the more regrettable because these students embraced a large number who were exceptionally proficient and who had gone abroad early on the assumption that they would have important and superior advantages in training. It is said that their numbers were larger than the capacity of the French and British schools which it was expected would receive them.

In his cable of March 13th, General Pershing speaks of the plight of these cadets as follows:

"P. 726, Paragraph 1. Dated March 13th, 1918.

"For Chief Signal Officer. Approximately 700 cadets are now under flying training in Europe. These cadets had to wait an average time of three months before commencing flying training. Approximately 700 cadets in Europe awaiting flying training. These Cadets have already waited from three to five months for training and it is estimated that some of them will have to wait at least four months before their training can be commenced. All of those cadets would have been commissioned prior to this date if training facilities could have been provided. These conditions have produced profound discouragement among cadets. In order to remedy injustice and to relieve Cadets in Europe on equitable basis of rank with Cadets trained in the United States request approval of plan to immediately issue to all Cadets now in Europe temporary or reserve commissions in Aviation Section Signal Corps subject to revocation in all cases where on completion of training Cadets so commissioned are found not to have requisite qualifications for officers in the Air Service. If plan approved will recommend Cadets by groups according to seniority. Strongly recommend approval.

"Pershing."

The Secretary of War observed this condition during his visit to France in the Spring and cabled that these cadets should at once receive their commissions, which were to be held subject to revocation if later they were not found to be qualified. General Pershing stated in his cable of March 30, 1918, that this relieved the principal difficulty so far as training was concerned and the situation as it then existed was "difficult because of lack of machines for front and not because of lack of training facilities."

Lack of Information Here as to Exact Status of Foreign Orders

Despite constant interchange of cables, information was lacking here as to the exact status of the foreign orders. While cable inquiries had been made from time to time, it appears from a letter written by Lt.-Col. Horner for the Chief Signal Officer to Colonel Bolling, as late as March 12, 1918, that the desired information had not been obtained. There had been apparently an utter lack of an adequate system of communication by which proper records could be kept here of the transactions abroad. Tables and charts of the foreign orders and deliveries were finally received here, but it seems that there still was considerable uncertainty as to the extent of the foreign obligations, and at the beginning of this investigation the extraordinary statement was made by Lt.-Col. S. E. Wolff, then head of the Finance Division, that notwithstanding repeated inquiries, extending over many weeks, he had been unable to ascertain within $100,000,000 what obligations had been incurred abroad.

Agreement with French Government of May 3, 1918

On May 3, 1918, a new agreement was made with the French Government by which the contract of August 30, 1917, was cancelled. Provision was then made by the French Government for the acceptance of orders of the American Government for aeronautical material, and for the acceptance by the American Government of orders of the French Government for raw materials and other supplies. As these orders would be intended to meet, in the common interest, the military needs of each country presenting them, it was agreed that each Government should fill the orders so far as compatible with its own requirements and resources. It was further agreed that upon the arrival in France of the raw materials included in the contract of August 30, 1917, they should be delivered to the French Government on the assurance that they would be utilized in accordance with the conditions set forth in the new agreement; and also, that until the American Army should be able to meet its own requirements in aeronautical material, the French Government should place at the disposal of the American aviation units, and such instruction units as may be required, the same aviation material as used by the corresponding French units, both as to quality and quantity.

It would seem that by May 23, 1918, there had been delivered by foreign governments for our use abroad about 1,400 training planes and about 350 service planes. Since that time there have been additional deliveries and according to a list obtained by General Kenly the approximate number of aeroplanes received by our forces from European sources to July 31, 1918, were as follows:

School or training planes	1617
Service or combat planes	1512

PRODUCTION IN THE UNITED STATES

Recommendations of Bolling Commission

While Major Bolling's Commission, in anticipation of delays here, placed large orders abroad, it is evident that the speediest production in this country that was possible, of a variety of aeroplanes and engines, was contemplated. The Bolling Commission recommended for production here:

"AEROPLANES.

"Advanced training Bristol Scout with 80 Le Rhone.

"Division or Corps d'Armee Bristol Fighter with 200 Hispano.

"Long Range reconnaissance and day bombing D. H. 4 with Rolls-Royce or some other equivalent engine to be later adopted. Fiat 300 has proved successful here.

"Fighting or Pursuit (fixed engine) Spad with 200 HP Hispano.

"Fighting or Pursuit (rotary engine) New Spad with 150 Gnome. (This aeroplane is now undergoing final tests).

"Night bombing Caproni Triplane with 3 Isotta Fraschini 270 HP engines or other equivalent engine to be later adopted. For very long distance bombing with heavy loads the Italians are now arranging to use the Caproni Biplane with 3 Isotta Fraschini engines instead of the heavier Fiats now used. For distances of 400-500 miles (out and back included) the much greater consumption of gasoline and oil by the Triplane gives it little greater bomb carrying capacity than the Biplane with Isotta-Fraschini engines and the Biplane can be produced much more quickly and in greater quantities. It is also much easier to house at the front. For bombing at shorter distances nothing gives such great bomb carrying capacity as the Triplane.

"ENGINES.

"80 Le Rhone for training purposes.

"200 Hispano Suiza for fixed engine one place fighters and division or Corps d'Armee aeroplanes.

"150 Gnome Monosoupape for rotary engine fighters.

"Rolls Royce for U. S. production only under some special arrangement of a Rolls Royce factory in U. S. This engine is not considered suitable for great quantity production. It also requires very skillful mechanics to keep it in commission at the front.

"While we have investigated many other excellent engines such as Renault, Fiat, Isotta-Fraschini and S. P. A. all of them are too heavy per horsepower to be recommended as engines for great quantity future production in the U. S. Renault, Fiat and Isotta Fraschini all have new designs now under test which may prove very desirable. The Bugatti engine appears perhaps to offer the most interesting future development for light weight per horsepower and ease of quantity production. The developments with our U. S. engine now under test are probably the most important consideration in this question of engine production in the U. S. Of course, we are without any adequate information over here as to these developments."

Recommendations of Army and Navy Technical Members of Bolling Aeronautical Commission

Captain Clark, U. S. A. S. C., Captain Marmon, U. S. A. R. S. C. Naval Constructor Westervelt, U. S. N., and Lieutenant Child, U. S. N., the Army and Navy technical members of the Bolling Commission, on their return to the United States made a report to the Secretary of War and the Secretary of the Navy under date of September 4, 1917, which embraced the following recommendations:

"23. So far as land aeroplanes are concerned, the types at present indicated as necessary, are the following:

"(A) Primary training—dual control—about 90 H. P.

"(B) One or two types of machines for training toward the fast fighter—Single seater—using for the present, the 80 H. P. Le Rhone rotary engine.

"(C) Army observation—two seater—using probably between 225 and 250 H. P.

"(D) Single-seater fighter—using a rotary engine of about 170 H. P. (If a water-cooled engine can be built which will, at altitudes, give more power per total weight than the rotary, this type of aeroplane should be eliminated.)

"(E) Single-seater pursuit—should mount an engine which will give about 150 H. P. at 20,000 ft. altitude.

"(F) Day bomber—should mount one engine which will give about 325 H. P. at 15,000 feet.

"(G) Night bomber—should mount two or three of the engines mentioned under (F).

"In order to minimize the number of types of engines, it might be desirable to use the same engine in the Army Observation and in the single-seater pursuit Such an engine should give about 180 H. P. at 15,000 feet."

Recommendations of Captain (afterwards Lt.-Colonel) Clark

Captain Clark, who had a larger experience in aeronautics prior to our entry into the War than any other member of the Commission, was the expert largely relied upon to make suggestions as to the planes which should be manufactured. He visited numerous factories in England, France and Italy and also observed the types of planes in operation at the front. He testifies that his final recommendations on his return to this country in early September, 1917, after learning the situation with respect to engine production here, were for the production of the following types of planes:

Day bomber DeH-9 with the Liberty direct drive, 12 cylinder high compression engine.

Army observation Bristol fighter with the same engine.

Night bomber, a Caproni triplane with 3 Liberty low compression geared engines (Handley-Page an acceptable substitute).

Two-seater fighter, a Bristol fighter with the Liberty 8-cylinder, or with that number of cylinders which should be developed.

Single-seater pursuit,—the Spad, with the Hispano-Suiza.

Single-seater combat with a rotary engine, 150 H. P. Gnome.

Advanced training machine, Bristol Scout, with 85 H. P. Le Rhone.

PROGRAM AS ADOPTED

Elementary Training Planes

There were selected for production to be used as elementary training planes the Curtiss type known as the JN4-D, with the OX-5 engine, and the Standard type known as SP-1 with the Hall-Scott or A-7a engine. The program called for 4,800 JN4-Ds (later reduced to 3,700, and his number was somewhat increased after May, 1918); for 1,600 SJ-1s; for 7,950 OX-5 engines and 2,750 Hall-Scott, or A-7a engines (reduced to 2,250).

Advanced Training Planes

For advanced training, it appears that there were originally chosen the Bristol Scout with the Le Rhone 80 H. P. engine, the Thomas Morse S-4 with Gnome 100 H. P., and the U. S. Training with the Hispano (150 H. P.). There were modifications which resulted in the adoption of the types known as S4-B (with Gnome 100 H. P.), the S4-C (with LeRhone 80 H. P.), the JN4-H and JN6-H (with the Hispano 150 H. P., and the Penguin (with the Lawrence 28 H. P.).

Service or Combat and Bombing Planes

The types first selected for production were the Spad (single-seater pursuit) with the 200 H. P. Hispano Suiza engine; the Spad using the U. S.-8 engine; the Spad Monocoque, using 150 H. P. Gnome engine; the Martinsyde; the DeH-9, the Caproni and the Handley-Page, with the Liberty engine (U. S.-12). Subsequently the Martinsyde and the Spads were rejected, the production of the DeH-9 was first limited and then postponed, the Caproni and the Handley-Page were not treated as a part of the immediate program, and the plans for production were centered on the DeH-4 and the Bristol Fighter with the 12-cylinder Liberty engine (U. S.-12).

The program charts which were prepared show extraordinary variations with respect to quantities and surprising expectations as to deliveries. Thus the program for DeH-4s shows a total program on August 2, 1917, of 8,000; August 16, of 7,500; August 22, of 5,000; August 24, of 6,000; August 25, of 15,000; August 31, of 6,000; September 4, of 15,000; October 17, of 250; October 29, of 1,000, at which number it appears to have been continued until January 18, 1918, from which time it was increased until 4,500 appear in the program of February 11, 1918, and 8,000 in that of February 19 and thereafter.

According to this program or schedule it seems to have been anticipated on August 2, 1917, that 25 DeH-4s would be delivered in October; 100 in November; 425 in December; 750 in January, and 1,000 in February; and more in each of the succeeding months. Even as late as September 4, 1917, the schedule shows expected deliveries of 62 in October, 1917; 250 in November; 1,063 in December; and in the program of November 5, 50 were scheduled for delivery in December, 100 for January, etc.

The program of September 5, 1917, for the DeH-9s calls for 2,000 of this type; that of October 9, for 4,000; October 17, 6,750; October 25, 7,750; October 29, 7,000, at which it continued until January 18, 1918, when it became 7,500, to be reduced on February 1, to 5,400; and on February 12, the DeH-9 schedule was cancelled.

On September 5, 1917, according to this schedule, deliveries of DeH-9s were expected as follows: November, 1917, 50, December 200, January 250, and 300 in February, March, April, May and June. On November 5, 1917, 50 seem to have been expected in January and 300 in February, 1,050 in March, 1,500 in April, 1,900 in May and 2,200 in June. As late as January 18, 1918, 40 are scheduled for March and 500 for April.

The program for the Bristol Fighters started on August 2, 1917, with 1,000. It appears to have been raised to 3,000 on August 16, 1917, within one week it was dropped again to 1,000, and on November 26 the program was finally raised to 2,000. It seems that on August 2, 1917, deliveries of 25 were scheduled for October, 50 for November, 100 for December, 125 for January, etc. On November 5, 1917, the schedule calls for 50 in January, 150 in February, 200 in March, etc.

On August 9, 1917, the Caproni program called for 500; on August 16, for 9,000; on August 22, for 2,000; on August 24, for 500, and there were other variations until the program appears to have settled down after September 28, 1917, to 1,000. On February 19, 1918, the program dropped to 50; it called for 250 on May 3, 1918, and was afterwards increased to 1,000.

On August 9, 1917, when the program for Capronis called for 500, monthly deliveries of 100 were scheduled to begin in February, 1918. A week later, on August 16, 1917, when the program was increased to 9,000, deliveries of 900 were scheduled for December, 1,350 for January and each month thereafter. When the schedule was dropped to 1,000, deliveries appear to have been expected of 100 in February; and in February deliveries of 100 seem to have been looked for in May.

The Handley-Page program shows on September 5, 1917, a total of 1,500, with anticipated deliveries of 100 in December, 300 in January, 400 in February, etc. As late as January 8, 1918, deliveries were scheduled for February of 110, 190 for March, 200 for April, etc. On March 18, 1918, the program had dropped to a total of 50.

These programs, with their variations and schedules of deliveries, appear to be grotesque in the light of the actual facts, but they bear the *imprimatur* of the Planning Department of the Equipment Division with the countersign (except in the case of the DeH-9s) of official approval.

Suspension of the Program for Single-Seater Pursuit Planes

On October 5, 1917, in reporting the failure of the Spad Monocoque, the cablegram from our representatives overseas also contained the following advice as to single-seater pursuit planes with rotary engines:

"Recommend you build no rotary engine single-seater pursuit aeroplanes to be sent to Europe existing machines this type will be outclassed by changing time yours arrive, build only what you need for use in United States training purposes."

This, however, did not touch the Spad intended to be used with the fixed engine, that is, with the Hispano Suiza engine. That machine was not experimental. As early as July 15, 1917, there was official advice that "200 H. P. Hispano Suiza (is) now fighting on front in Spad aeroplanes." Colonel Bolling reported in his cablegram of August 1, 1917, that the Spad with that engine is "the best fixed engine fighter now in service." There is no reason why this fighting plane should not have been produced here in quantity many months ago. The failure to do so was not due to lack of facilities, but simply to a change of opinion at a critical time as to what was advisable.

Responding to repeated and urgent recommendations for production of Spads in this country, an order for 3,000 Spads was placed with the Curtiss Aeroplane and Motor Corporation under date of September 19, 1917. But this order had barely been placed when doubt was cast upon the enterprise, and after preparation for production was well under way the order was cancelled on November 7, 1917. This is the date of the cancellation, as testified by Mr. Morgan, then Vice-President of the Curtiss Company. It was nearly six months later that the production of a single-seater pursuit plane (the S. E. 5) was undertaken, and thus there was a serious loss of time through a reversal of judgment which was in turn reversed.

It should be noted that virtually all the cables of advice sent by our military representatives abroad are signed "Pershing", but doubtless they most frequently come from subordinate officers, and with respect to the subject under consideration, from those in charge of the Air Service overseas. In a cablegram received here on October 5, 1917, the following appears:

"If USA 8 cylinder heavier than Hispano Suiza pounds per horsepower build no monoplace pursuit aeroplanes with USA 8 cylinder engines. Machine will be useless by time it arrives here. Increase number DH 4s or DH 9s by number monoplace pursuit aeroplanes. This is necessary provided USA 12 is success. Useful loads increasing so rapidly here that engines now in United States are not considered powerful enough to meet requirements. Two-place pursuit aeroplanes considered most urgently needed aeroplanes next year."

The view thus set forth found support in influential quarters here. On October 27, 1917, Lieut.-Col. Clark in a memorandum sent to Mr. Coffin expressed the opinion that "all fighting and bombing by day will be done in two-seaters flying in regular formation." And he added, "The single seater will be eliminated." A few days later the following cablegram was received:

Nov. 8, 1917. No. 252 (S. D. 2709) Par. 1.

"Your 359, paragraph 7, and other cables concerning American engine program. Situation here has changed much during three months since original recommendations and continues changing constantly. Following general principles appear clear to us. First. Single seater fighter will probably become obsolete general use next year, although small numbers will always be used special purposes. Recommend you produce number already actually under contract and started. Believe we can obtain here all this type required future above number actually under contract here and America. This applies both single seater fighter aeroplanes and engines. Second. Two seater fighter aeroplane with stationary engine will supersede single seater. 400 horsepower probably sufficient next six months, after that five hundred horsepower necessary. This summarizes cables already sent you."

It will be observed that while this message recommended against further production, it distinctly stated that the number, already under contract and started, should be produced. But this was not done.

On November 30, 1917, Colonel Deeds cabled:

"Curtiss company have completed drawings and ordered material for Spad for 220 H. P. geared Hispanos. We have cancelled that order. Tulasne suggests possibility of helping the French program by building Spad planes here to be equipped with 220 H. P. geared Hispano engines built in France. We could get production in February without materially affecting output of two-place fighters. We are not urging this because of the fact that we have ordered material which can be utilized in other machines, but if it would help your program here is a quick source for these machines."

To this there was a reply (from London) on December 14, 1917, as follows:

". . . With reference to paragraph 1 your cablegram 461 do not recommend unionized production Spad aeroplanes for France. No such request received from French here. Believe they can produce all these aeroplanes they need. Think our only efforts should be applied aeroplanes and engines already on our program. United States should leave production single place fighter to Europe."

The Spad contract having been cancelled and preparations for the production of single seaters in this country abandoned, in less than two months there was an urgent request from our military representatives abroad that Spads be produced here. As early as February 10, 1918 it was recommended that steps be taken to "put into production 1,000 Spads one-place with 220 H. P. Hispano Suiza engines for earliest possible delivery in France." It was said that "French delivery of one-place Spads very uncertain and can not be depended upon. Should have more definite information next two weeks as to whether your production Spad one-place fighter should be further increased." While this new proposal was evidently the result of the breakdown in the French deliveries, it seems that a closer inquiry into the progress of our deliveries of raw material abroad and the conditions of French manufacture would have revealed the serious importance of continuing

the production of single seaters in this country in accordance with the original program.

However, the authorities here were not then ready to follow the new recommendation, and two weeks later, on February 25, 1918, they cabled the following reply:

"Production of Spads with 220 H. P. Hispano Suiza engines does not fit well into our program because engines cannot be put in production without material delay. Probably first deliveries in France in December. We could somewhat more easily produce the 300 H. P. Hispano Suiza engine. We are now producing large number of 150 H. P. engines for training planes, and could even increase production. We believe with this information you will probably decide not to request production of Spads here. Please give us your full advice."

It was not until March 9, 1918, that this cablegram was answered, with the statement that "question being considered. Will advise you soon." On April 6, 1918, Mr. Potter cabled that the British Air Board had advised that they could supply at once two hundred SE-5 planes without engines. He added, "We can arrange production for 180 H. P. Hispano Suiza engines for same at rate of five per day within 30 to 60 days. Shall we arrange engine supply. If so, will you arrange contract for planes." On the same day Colonel Deeds cabled:

"We could within four weeks begin to supply 180 H. P. high compression direct drive Hispano Suiza engines to be shipped to England, to be installed in the planes by the plane manufacturer. Would this type of fighting machine be of value to you, and if so shall we proceed to provide them for you? We are advised that this type is in successful use by the British on the front."

On April 19, 1918, the following urgent message was received from our representatives abroad:

"The United States should make immediate preparations for the production of single seater machines to supplement those we may receive from France and England."

But on April 21, 1918, there was a further cablegram (referring to Mr. Potter's cable of April 6, 1918) stating that the whole subject was still under consideration. This message was (in part) as follows:

"Will the production of 180 H. P. Hispano Suiza engines be interfered with by contracts placed by French or English. If not, we strongly recommend production of this motor for our needs this year on following basis." (Giving delivery dates.) . . . "The situation with reference to single seater fighters for remainder of 1918 is as follows: Both France and England have a plane production in excess of their engine production and as the 180 H. P. Hispano Suiza is already in production in United States in small quantity, our only practical means of securing the necessary number of single seater fighters will be for the production of this engine for overseas duty to be increased so as to provide the number indicated and for us to distribute these engines here month by month as conditions require. The entire question of the provision of single seater aeroplanes for 1918 and 1919 is being thoroughly investigated and a comprehensive report with all data necessary will be forwarded by an officer familiar with the entire situation."

On April 24, 1918, Mr. Potter cabled that contract could be made with the British Government for SE-5s at the rate of 30 per week beginning July 1st; that 180 H. P. high compression Hispano-Suiza motors could be supplied from here for those planes at the same rate, and that the same machine could be put into production here and shipments begun in September. He asked quick advice if arrangements were desired which would permit of "quickest possible delivery of single seater fighting planes on the front", and he added "SE-5 equipped with 180 Hispano is the only machine we can produce quickly."

To this an answer was received on May 4, 1918, disapproving the production of SE-5s, as follows:

"Production of SE-5 for 180 Hispano in America disapproved since it appears that necessary planes for this engine can be obtained in Europe either SE-5, Spad or both."

This was followed on May 12, 1918, however, by a cablegram stating that the question was still open pending final report of Board of Air Service officers and that final recommendation would be cabled in about ten days.

On May 15, 1918, Mr. Potter cabled referring to the message from overseas of April 19, 1918, urging immediate preparation for production of single-seater fighters and calling attention to the fact that the cablegram of May 4, 1918, was an exact reversal of the former recommendation. He said:

"We took immediate action on this recommendation and have given orders for 1,000 SE-5s. You 1052, par. 2-A exactly reverses these recommendations. In view of this inconsistent information and also due to requests for production of SE-5 from Air Division for training purposes, we have decided not to change our orders for production on these machines, and request that samples be sent promptly in accordance with our London 81, par. 3."

The final result is that there has been no renewed order for the production of Spads, and that the order for SE-5s is being proceeded with, but that the American machine of the type is still in an experimental stage. It is understood that the machines are being tested, and that the questions which have arisen and have been brought to the attention of the authorities are receiving their consideration. We have not as yet sent from this country to the battle front a single pursuit or combat plane, as dintinguished from the heavy observation or bombing planes, and, after giving due weight to all explanations, the fact remains that such pursuit planes could have been produced in large quantities many months ago had there been prompt decision and consistent purpose.

Delayed Program for the Handley-Page and Caproni Bombing Planes

Although the Handley-Page and Caproni planes remained in the program, production was delayed. Both these types of bombing planes were included in the modified recommendations of the Joint Army and Navy Technical Board, on November 21, 1917, and these recommendations were approved by the Secretary of War and the Secretary of the Navy.

Handley-Page Planes

On January 25, 1918, a resolution recommending a contract for Handley-Page planes with the Standard Aero Corporation was tabled by the Aircraft Board, in view of the fact that such an order might interfere with work already undertaken by the company. On February 8th the Board discussed the advisability of concentrating upon the manufacture of a single type of night bomber, and it was stated that due to the lack of history as to the comparative performance of the Handley-Page and Caproni, the decision had been made to put both types into production in the United States. Arrangements had been made for the assembly in England of Handley-Page machines for the American service, and on February 19ht the minutes of the Aircraft Board show that a cable had been received on February 14th by the British War Mission, indicating that it would be serious to cancel these arrangements. The minutes add that in view of "a cable received February 18th from General Foulois recommending the building of both the Handley-Page and Caproni types, because of the military needs for the immediate future, it was decided that at present both types should be constructed", and the Secretary was asked to keep before the Board's attention the necessity of making a decision prior to July 1, concerning the concentration on the manufacture of one of these types for the year 1919.

On March 19th the Aircraft Board recommended that a contract be placed with the Standard Aircraft Corporation for the assembling of 500 Handley-Page planes and the furnishing of such parts (other than wood parts) as the Government might require, these planes to be assembled and taken down and disassembled and packed for export shipment to such extent as the Engineering Department should require, but not more than ten per cent. of these, that is, 50 planes to be fully assembled for testing and flying in this country. Orders for 1,000 sets of wood parts, and for various metal parts, of the Handley-Page were placed. In a letter to Colonel Bloomfield, Air Division, under date of March 20, 1918, M. W. Kellog, Director of Production, thus summarizes what had been done up to that time:

"2. Sometime ago miscellaneous orders were placed from time to time, either by letter or word of mouth with people that our Production Department felt could facilitate this matter by having manufacturers start on the work. These manufacturers, as per list attached, have done more or less work. The ones that are further advanced are the W. R. Mullins Company of Salem, Ohio, who are supplying approximately 75 per cent. of the metal parts to be used, also the Grand Rapids Aeroplane Company of Grand Rapids, Michigan, on the wood parts, they having at this time received about 250,000 feet of spruce and I understand that a large part of this has been in the kilns and they will start work in a short time which we would judge to be approximately from a week to ten days, manufacturing some of the parts. The other manufacturers are in a more indefinite condition. We are now trying to adjust the questions between them and the Signal Corps by giving them a formal contract, and at the same time ascertaining as far as possible the exact conditions of their detail part of the work. Some of these sub-contractors have very small items. As an example, the two tire companies have only been instructed to develop and make the molds for the tires and have manufactured a very few tires each. Other companies have only made dies for a very small percentage of the stampings, etc., etc.

"3. We gave a contract a week ago for the assembling of the machines that are going to be assembled, to-wit: fifty, and for the marking, listing, packing, etc., for export abroad for four hundred and fifty, to the Standard Aircraft Corporation who, in connection with our engineers, will use their best efforts to push the work.

"4. We are just starting at this time to line up our Production Department on an aggressive assembling of this material and a correlation of same with a view that if it develops that any of the manufacturers are in such a position that they would seriously delay the work, to put pressure upon them to try to overcome such a condition.

"5. We are advising you of all these facts to as clearly as possible give you a picture of the situation so that you can use your own judgment and do as he sees fit in this connection.

"6. You will note that while we have ordered numerous parts for 1,000 planes, our assembling contract only covers 500. This was done with the distinct understanding that if the contractors did their work efficiently and well and in proper time, we would favor them with a further order of not less than 500 more machines."

The first Handley-Page plane assembled in this country was flown in the early part of July.

The Standard Aircraft Corporation, it appears, was able to produce the first Handley-Page machine within ninety days from the time they were given full authority for that purpose, and the testimony is that making allowance for whatever advantage existed by reason of the fact that previous contracts had been let for certain parts the first machine could have been produced, at the outset, within one hundred and twenty days. Further time, of course, would have been required for quantity production, but for the long postponement of the program of the Handley-Page no satisfactory reason is shown.

Caproni Planes

In the minutes of the Aircraft Board, under date of February 12, 1918, it was recited that the Italian manufacturer Caproni had sent to this country samples of his triplane and biplane, with his production engineer, Captain D'Annunzio, expert fliers, and thirteen factory experts to assist the United States in placing Caproni's into production. On February 7, the Board had recommended that a contract be made with the Standard Aircraft Corporation for the manufacture of fifty Caproni planes. Mr. Coffin urged on February 20 that plans be laid for quantity production of Capronis, to be assembled in Italy, but it was the feeling of the Board that the matter should be held in abeyance until the production of sets of Caproni parts for the Italian Government were under way.

On April 11, 1918, it appears to have been the sense of the Aircraft Board that the Caproni should be put into immediate production in view of (1) repeated cable advices to that effect; (2) the actual experience in Europe with the Caproni; (3) the fact that Captain D'Annunzio had assured the Signal Corps that there would be no difficulty in the installation of the Liberty motor. On March 21, 1918, Mr. Potter advised the Board that the Italian Government did not desire a contract for the manufacture of Caproni parts in this country, because of the remoteness of contemplated deliveries, and inquired the disposition of the Board as to the manufacture of 50 complete Capronis, as recommended on February 7. On March 26, 1918, the question of manufacturing the Caproni was again raised in the Board and after discussion was referred to the Chief Signal Officer for the consideration of Colonel Waldon, with especial reference to the question of the establishment of an assembly plant in France. On April 2, a letter addressed by the Italian Ambassador to the Chief Signal Officer was referred to the Board, inquiring whether the American Government intended to build Caproni planes for its own use, and if so, how many. Discussion was had of the question,—"in view of cables recently received urging such production and the expense already incurred by the Government in preparation therefor."

On April 23rd Mr. Potter stated to the Board that a verbal order had been given to the Fisher Body Corporation for 250 Caproni planes and that preparations for production were under way. On May 9th it was further stated by Mr. Potter that arrangements had been made with the Fisher Body Corporation and Captain D'Annunzio for the manufacture of 500 sets of Caproni parts by that company, contract for which would be let as soon as funds were available and that preparation for production was under way, which, however, was not promised before September. Contracts were made in June, 1918, with the Fisher Body Corporation and the Curtiss Aeroplane and Motor Corporation, each for five hundred Capronis. There were arrangements several months ago, apparently of a tentative character,

with the Standard Aircraft Corporation for four Capronis of which one has been built.

There appears to be no adequate reason for this long delay in putting the Caproni planes into production. If it was due to congestion in plants selected for production, this could have been obviated by a better and wider distribution of work. This is, of course, so far as the matter of plane production is concerned. The immaturity of the Liberty motor doubtless had its effect, but it would seem that orders for the motors sufficient to meet all appropriate demands should have been distributed in such a way that there could have been no occasion for delay in the building of planes because of the lack of orders for the engines to go with them.

Postponement of the DeHaviland 9

In his recommendation, on his return from Europe in September, 1917, the DeHaviland 9 was preferred by Captain Clark, as the DeH-4 appeared to him to be obsolescent at the time the Bolling Commission was in England and the DeH-9 was designed along the same general lines as the DeH-4, but with its weaknesses, from a military standpoint, corrected. In other words, he regarded the DeH-9 as far better suited for bombing than the DeH-4. The principle distinction is that on the DeH-9 the rear man—the gun fighter—is moved back about twenty inches from his position on the DeH-4; the pilot is moved back so that he is placed immediately in front of the gun fighter; the fuel is moved forward so that it is near the engine, and between the fuel tank and the pilot is a bomb compartment.

The contracts with the Dayton Wright Airplane Company, the Fisher Body Company and the Standard Aircraft Corporation, originally called for DeH-9s. When, on September 22, 1917, the program, as it then stood, was submitted to Colonel Bolling on behalf of the Chief Signal Officer, it called for 2,000 DeH-9, and the reply was that the number was not sufficient and should be doubled. It may also be noted that in the same cablegram (September 22nd) from the office of the Chief Signal Officer it was stated that the first deliveries of the DeH-9 with the Liberty 12, and synchronized Marlin piston type aeroplane gun, would be made in November, 1917.

The sample machine, however, which was first received from England was the DeH-4. The DeH-9 had not yet been put into service at the front. Apparently there was no sample DeH-9 available here until at the end of February, 1918, and it seems to have been thought that progress had been made to such a degree in the developing of the design of the DeH-4 for production that it was advisable to concentrate upon the production of the DeH-4 to the virtual exclusion of the DeH-9. Consequently, in the substitution of contracts, the DeH-4 took the place of the DeH-9 and it appears that in February, 1918, directions were received from Colonel Deeds and Colonel Montgomery that orders for DeH-9s were to be cancelled for the present, pending information from abroad.

It seems that with an adequate production program, this improved type, or its American equivalent, could have been produced here some time ago, but it has not yet been put into quantity production. It is said, however, that the DeH-9 is now "being put out of production abroad" because of the "coming in" of the DeH-9A which is a further improvement.

Result

For obvious reasons, it is not deemed advisable to make public the details of the present aircraft program. That can be stated by the military authorities whenever they think it wise to do so. For the present purpose it may be said that the abandonment of the program for the Spads left us, until recently, without any program for single-seater pursuit planes, and that also, until recently, so far as service planes were concerned, there remained a program for immediate production which was virtually limited to DeHaviland 4s and Bristol Fighters.

The Bristol Fighter as redesigned to take the Liberty Motor proved to be a failure and after a series of fatal accidents was discarded. The Bristol was so far removed from a machine that could carry an engine of that power that it has been admitted by high authority that it was "a very foolish thing to put the two together."

Thus, nothing is left of last Fall's program for service planes save the DeHavilands 4s. The course of production of these planes is hereafter stated. It appears that after the remedying of various defects, they are being successfully used as observation and bombing planes. There are certain limitations, which it is not necessary to describe, of their military effectiveness for this purpose, and machines of the later and improved types are to be provided. By reason of a lack of manouverability the DeHaviland 4 cannot serve the purpose of a pursuit plane.

Engines for Service Aeroplanes

The Bolling Commission's recommendations for the production of engines in the United States for service aeroplanes embraced the 200 H. P. Hispano-Suiza for fixed engine single-seater fighters, the 150 Gnome for rotary-engine fighters, and the Rolls-Royce for United States production only under some special arrangement for a Rolls-Royce factory in the United States. It was said that the Rolls-Royce engine was "not considered suitable for great quantity production. It also requires very skillful mechanics to keep it in commission at the front." It was added that the Renault, Fiat, Isotta-Fraschini and S. P. A. were too heavy per horse power to be recommended for great quantity production in the United States and that the first three mentioned had new designs under test which might prove very desirable. Special attention was directed to the development of the Bugatti engine. And this statement of the Bolling Commission concluded with the observation that the developments in connection with the United States (Liberty) engine now under test "are probably the most important consideration in this question of engine production in the United States."

Rolls-Royce and Sunbeam Engines—British Experience

There has been considerable testimony as to the feasibility of securing, in the year 1917, the early production of certain foreign engines, notably the Sunbeam and the Rolls-Royce. In order that there might be an authoritative statement of British experience, there was obtained, through the courtesy of the British Ambassador, a memorandum under date of June 22, 1918, which has the authority of the British Air Ministry. From this it appears that when we entered the War, in April, 1917, the British had in use the following aeroplane engines: 160 H. P. Beardmore; 150 H. P. RAF4-A; 130 H. P. LeRhone; 130 H. P. Clerget; 190 H. P. Rolls-Royce; 150 H. P. Hispano-Suiza; 275 H. P. Rolls-Royce; 320 H. P. Cossack Sunbeam; 230 H. P. RAF3-A. The following engines at that time (April, 1917) were "coming on": 150 H. P. BR-1; 180 H. P. Viper Hispano; 220 H. P. Geared Hispano; 200 H. P. Arab Sunbeam; 220 H. P. B. R. 2; 270 H. P. Falcon, Rolls-Royce; 140 H. P. Clerget; 375 H. P. Eagle Rolls-Royce; 260 H. P. Maori Sunbeam. With respect to these engines, the memorandum furnished by the British Ambassador contains the following statement:

"Of those 'in use' in April, 1917, all were good reliable engines, but it was obvious that they could not remain in the front rank for very much longer.

"Of those 'coming on' the two Rolls-Royce engines and the 180 Viper Hispano were practically certain to be a success.

"The others were undeveloped and could not have been recommended at that time; so that in April, 1917, no Sunbeam engine could have been recommended for manufacture in America, and the general opinion in England was that the Rolls-Royce was quite unsuited to American methods of production."

A further communication from the British Ambassador state that what is quoted above on the Rolls-Royce and Sunbeam may be taken to apply equally to July and August, 1917. It should be added that in 1917 Colonel Bolling cabled advising against the production of the Sunbeam engine in the United States.

The Hispano-Suiza Engine

A different situation existed with respect to the Hispano-Suiza engine, which had been used extensively abroad. In the Summer of 1917 the 150 H. P. Hispano-Suiza engine was in production at the plant of the Wright-Martin Aircraft Corporation at New Brunswick, New Jersey. That company had received an order from the French Government in February, 1916, for 450 of these motors. Although the contract was to be fully performed by the late Summer of 1916, there was serious delay and deliveries did not begin until March, 1917. This delay was due in large part to the difficulty of putting into production an article of very fine workmanship and material which was entirely new to American shop practice. The greatest problem in this sort of work has been the procurement of materials of proper refinement and texture. The delay was also apparently due in considerable measure to conditions which could have been remedied, and a comparatively small force was engaged on the Hispano-Suiza motor work during the year 1916, the main effort of the company at that time being motor car production. (Since the Fall of 1917 virtually all the facilities at the New Brunswick plant of the Wright-Martin Corporation have been engaged in the manufacture of aeroplane engines.) By September 1, 1917, 202 engines had been delivered under the French contract, and by October, 1917, the difficulties had been surmounted; in that month 117 were produced and the French contract was completed in November, 1917.

The Signal Corps placed a number of contracts with this Company, reflecting changing purposes. Under date of July 31, 1917, it placed a contract for 500 of the 150 H. P. Hispano (Type A). In September, 1917, a further contract was made for 500 of the same type and this was cancelled on October 2, 1917. On the latter date the company received a contract for 4,000 of the 220 H. P. Hispanos (Type F), which were the 150 H. P. engines geared to high speed. This contract was cancelled on November 13, 1917, and was replaced by the contract of that date for 1,000, 150 H. P. Hispanos (Type A). On November 20, 1917, the company received a contract for 3,000, 300 H. P. Hispanos (Type H) which was modified by two contracts in the present year postponing the delivery dates, the second of which (May 11, 1918) provided for the manufacture of the 300 H. P. Hispanos in Long Island City and for a further postponement of deliveries. On February 2, 1918, another contract was awarded to the company for 1,000, 150 H. P. Hispanos (Type A). On February 25, 1918, a contract was made for 1,000 Type E or I Hispanos; and on May 25, 1918, another contract for 1,000 Type E or I Hispanos was placed with the same Company. Type E is Type A modified as to connecting rod construction, magneto drive construction, and the piston design so as to make possible the carrying of a higher compression and thereby greater power, that is, 180 H. P. at normal speed. Type I is 150 H. P. and has all the improvements of Type E except the high compression.

The 300 H. P. Hispano (Type H) was in an experimental stage last November and the first deliveries now due of Type H are in October. Under the contract of July 31, 1917, for 500 150 H. P. Hispanos deliveries were to begin ninety days from date of contract and determination of final details. Subsequently, October 25, 1917, was fixed as the date from which the ninety days were to be reckoned and the deliveries were actually completed in February. Under the contract of Novmber 13, 1917, for 1,000 150 H. P. Hispanoes, deliveries were to be completed in April, 1918, and with the exception of one motor they were completed in May, 1918. Under the contract of February 2, 1918, for 1,000 150 H. P. (Type A) motors, deliveries were to be completed in July and, by the end of July, 988 had been delivered.

The Type A, or the 150 H. P. Hispano, has been used for the advanced training plane known as the JN-4H. The 180 H. P. Hispano is adapted to single-seater pursuit planes such as the Spad or the SE-5 and is now in course of delivery.

On July 25, 1917, the Wright-Martin Aircraft Corporation submitted to the Aircraft Production Board a schedule for proposed deliveries of the Hispano-Suiza motor "of either direct driven or geared specifications" amounting to approximately 7,000 over and above the deliveries then due on the French contract. The offer was on the condition that "orders are placed with us or some definite arrangement made for same at once, so that we have sufficient assurance to warrant us in making the necessary capital expenditures and providing further that arrangements can be made for the Government to furnish us with the necessary working capital in excess of our present resources."

There is ample basis for the conclusion that had there been a sustained effort to produce single-seater pursuit planes, and with this definite purpose adequate orders had promptly been given so as to justify the provision of additional facilities by this Company and the speedy utilization of its highest capacity, engines for these pursuit planes could have been delivered in quantity through the Winter and Spring and large numbers of these engines would have been available by July 1, 1918, in addition to the production needed for advanced training planes and without interfering with the development of the high-power Liberty motor. This is aside from what could have been accomplished through timely arrangements made for production by other companies.

Rotary Engines

In the cable of October 5, 1917, in General Pershing's name, it was recommended that "no rotary engine single-seater pursuit aeroplane" should be built here to be sent to Europe. On November 9, 1917, Brigadier-General Saltzman, Acting Chief Signal Officer, requested the opinion of the Joint Army and Navy Technical Board as to the extent to which rotary motors should be included in the building program for aeroplanes and engines in the future. In response, the Joint Army and Navy Technical Board replied that as "the tendency in the design of fighting aeroplanes" appeared to point toward two-seater fighters of maximum power, it was believed that in the general

building program for the coming year "rotary engines should be considered of secondary importance." It was added, however, that in order "to anticipate improvements in the art or changes in the military situation" it was desirable that the art of building rotary engines be retained in the United States, and that for this purpose "the organization skilled in rotary engine production be preserved." Referring to the schedule of production of rotary engines, the Board expressed the opinion that the order for 2,500 80 H.P. LeRhone engines was larger than was necessary to preserve the art and that this order should be reduced to the minimum number that would accomplish the purpose, and it was further recommended that steps be taken to preserve the possibilities of production of the 160 H. P. Gnome engine. The immediate occasion of this inquiry was the pending question whether the Government should purchase the plant of the General Vehicle Company, of Long Island City, which was manufacturing Gnome motors. This purchase was made but the manufacture of Gnome motors was continued at this plant for a time. In May, arrangement was made for the use of the plant by the Wright-Martin Aircraft Corporation in the building of 300 H.P. Hispano-Suiza. Additional orders have been placed for LeRhone engines. The rotary engines have been used for advanced training planes.

The Liberty Engine

In the latter part of the year 1914 the Packard Motor Car Company decided to go extensively into the development of air motors. It had received one of the Mercedes motors, used by the Germans in their aeroplanes, which had been imported in a racing *chassis*. Taking certain features from that motor and from other motors, an engine was designed in 1915, a duplicate of which was used in a racing car. This engine developed 140 H. P. at 3,600 revolutions per minute. Another model, with greater power, was completed in December, 1916, and was also used in a racing car; this was rated at 200 H. P. at 2,180 r.p.m. It was described in a pamphlet exhibited at the Aeronautical Show in New York in January, 1917, as "The Packard Aircraft Engine", exhibited "as a stimulant to the new aviation industry". The work of developing these motors had been under the direction of J. G. Vincent, then Vice-President of the Packard Motor Car Company in charge of engineering. In the latter part of May, 1917, Mr. Vincent took his drawings to Washington for the purpose of laying before the Government the plan of the Packard Company to manufacture these engines in large quantities through enlisting the aid of other automobile manufacturers who had experience in high-grade motor work. Mr. Vincent met Mr. Deeds, Mr. Waldon and others. The design was not deemed to be adequate for the needs on the Western Front and it was necessary to increase the horse power of the motor with lighter weight per horse power. Mr. Vincent worked in Washington in conjunction with Mr. E. J. Hall, of the Hall-Scott Company, making sketches for the purpose of improving the motor, and in a few days a new motor was designed embodying to a considerable extent the engineering features which had been developed during the past two years of experimental work. The first efforts were directed to the development of an 8-cylinder motor, and in a few days Mr. Vincent returned to Detroit, taking the Washington sketches for the purpose of having a wooden model made by the Packard Company, and this was done. At the request of the authorities, Mr. Vincent was loaned by the Packard Company in order that he might take charge of the Engineering Division of the Aviation Section of the Signal Corps. The Packard Company made a full-sized operating model, which was sent to the Bureau of Standards on July 3rd. Later, about August, 1917, the production of an 8-cylinder engine was postponed and the immediate production of a 12-cylinder engine of the same type was decided upon. In developing the design for the purpose of quantity production various difficulties were encountered. Aside from minor changes found to be necessary in the course of production, the crank shafts, connecting rods and bearings in the first thousand engines were too light, creating a dangerous condition. The crank shafts, connecting rods and bearings had be redesigned. It was also found to be advisable to change the system of lubrication and, again, it was difficult to obtain a development of radiators that were suitable for a motor of this size. As late as June 25th of this year, General Pershing's cable described a series of defects in the motors which had been shipped abroad and these, it is understood, were speedily remedied.

It now appears to be conclusively established that the Liberty engine is a great success for observation and bombing planes, and for this purpose it has found high favor with the Allies. It is too heavy for the lighter pursuit planes. The following statement furnished by the British Ambassador with respect to British opinion of the Liberty motor, was received on June 22, 1918:

"No bench tests have been applied to the Liberty Engine in England but tests in the air, similar to those applied to British engines, have been carried out on a D.H.9-A with satisfactory results. Bench tests in France were observed by members of the British Technical Department and were satisfactory. The tests carried out in France were the Standard French Test and do not differ very largely from the Standard English tests, except that the power output was taken with a fan brake instead of a Froude Water Brake, as generally used in England. The results were excellent, except that the design of crankshaft and connecting rod was found to be faulty, but this was well known and had been modified in the United States. The carburation was also found to be unsatisfactory but is now in course of being remedied.

"The official opinion of the Liberty Engine is that it is an engine which, with a natural development in the prefecting of its details, will prove reliable and up to the power and consumption standards that have been claimed. It is eminently suited for bombing and reconnaissance aeroplanes, but not for fighting aeroplanes. The number of engines actually ordered for the British Government is 980, but 4,500 are required by the end of the year. The British Government would have prepared to place an order for 3,000 at once, but, at the desire of the American Government, the order was limited to 980, the number which was allocated for delivery up to the end of June. Up to date, 205 engines have been delivered from the Works.

"The following is the text of a telegram received from the Air Ministry on June 8th:

" 'The British technical authorities have reported to the air minister the the liberty engines have now been subject to sufficient air experiment in England to warrant confidence in this engine. Excellent results have so far been obtained which place the engine at once in first line of high powered air engines. Naturally service experiment in the field is still to be obtained but the liberty engine will be a most valuable contribution to the Allied aviation programme and the United States should develop production with every confidence.' "

The following further statement was supplied by the British Air Ministry, under date of September 27, 1918.

"No severe bench tests on the Liberty Engine were carried out in England, owing to the extensive tests in America.

"The only bench test in England was one short test, at nine-tenths power, for data re oil and fuel consumption. The result was quite satisfactory.

"One engine was stripped after 100 hours flying and was found to be in good condition.

"Tests in the air have been carried out in de Haviland 9-A and de Haviland 10, machines. In these the engines have performed uniformly satisfactorily.

"The performance of the Liberty Engine is at least as good as that of the Rolls-Royce in identical machines. The information officially expressed four months ago, that the Liberty Engine would prove satisfactory in service, is wholly confirmed."

The facts as to production will be given later.

(*To be continued*)

STATEMENT FROM CURTISS AEROPLANE & MOTOR CORPORATION

"Justice Hughes' report on the aeroplane industry after 22 weeks of investigation sets aside the charges so freely made at the opening of the Hughes' inquiry that a devious trail of graft would be uncovered. We can all, as Americans engaged in the greatest struggle in history, be glad of that result.

"The report indicates facts which should assure the American public of the efficiency possible now in government direction and in manufacturing facilities under the regime of John D. Ryan.

"No one denies that there was a constant bedevilment of production during the period under review by Justice Hughes, because of constant changes in contracts and designs for planes. The Curtiss company had a very full share of this inchoate situation. It was on that very promise that the great North Elmwood factory was constructed. The building covers 26 acres under a single roof, certainly the largest single aeroplane plant in the world. But it was not until recently that definite use could be realized of more than 30 per cent of the maximum capacity of this plant. That is a condition which, we believe, was true of some other plants in the country.

"The Buffalo public is familiar with some of the details. Among them were, first, the award of an enormous contract for the Spads, the fast fighting plane used by the French. Thousands of men were immediately employed to start on that programme. They were kept from day to day awaiting final drawings, completed plans and definite go-ahead. Next came the Bristol contract. Changes in the plans for this machine were as frequent as sunrise and sunset. Finally, when it was seen that the Bristol was so overpowered that the motor tore off the fabric of the wings and shivered the whole machine to pieces, that machine was abandoned. In the Senate committee's investigation, an army officer testified that he knew of more than 2,700 changes in essential features of design in planes and motor for the aviation programme.

"This was a condition that necessarily and unavoidably, as far as a contractor is concerned, meant a disruption of industry. Men were kept on in departments from day to day waiting for the order to "Go-ahead." It is hard to get men and women skilled in the variety of trades necessary to the building of aircraft. Thousands came here from out of town. They were an industrial asset. No one knew at what moment nor on what day the company could use their labor in the carrying out of the contracts scheduled.

"During the months before the present organization of the Curtiss company took the reins, instances such as Justice Hughes makes the subject of a general statement were not hard to find. These instances refer to the large number of employees on the payrolls. It probably would not be hard to find in any organization employing at times as high as 15,000 men and women instances of workers punching time cards for one another. But it will be recalled that when such men were caught they were promptly turned over to the city and county and federal officials in Buffalo for court action. Justice Hughes' remarks in this section of his report should not be construed by the people of Buffalo as reflection on the general body of Curtiss workers.

"There are bright spots in Justice Hughes' report to prove that. He mentions, for instance, that up to July, 1918, the aeroplane plants of the country produced 4,572 elementary training planes and 1,000 advanced training planes. In the same time, 7,662 engines for elementary training planes were delivered to the government. The Curtiss company is proud of its record in the production of training planes, without which the aviation training schools could not have operated. Of the 5,572 planes and 7,662 engines mentioned by Justice Hughes, the Curtiss Aeroplane & Motor Corporation built and delivered about 4,500 of the planes and about 55 per cent of the motors. The Curtiss model JN was early adopted as the standard training plane and practically all of them were equipped with the Curtiss OX engine. The Curtiss JN has been readopted recently as the standard training plane. Since it has been recognized by the Allies, the JN becomes practically the standard training plane of the world.

While the army combat plane programme halted and stumbled, the Curtiss company has achieved a remarkable construction record for the United States Navy. The Curtiss company has produced enormous quantities of flying boats which have, in a great degree, been the means of overcoming the U-boat menace. The story of Curtiss achievement in the production of flying boats for the Navy will be a proud page of American history when the full military and naval story of America's part in the war can be told.

"Attention may be directed to another phase of the Hughes' report, in which he says: "There have been persistent rumors of pro-German sympathies on the part of employees of the Curtiss company, but it has been impossible to ascertain to what extent, if any, the demoralization that, until lately, recently has existed at the North Elmwood plant of that company, was due to any influence of this hostile description. . . . Facts warranting a definite conclusion as to disloyalty on the par of employees in important positions is lacking." The Curtiss management has never doubted the loyalty of its workers as a whole. The men and women of the Curtiss family have, to date, subscribed more than $4,500,000 to the Liberty Loan campaigns, and in the Fourth Liberty Loan campaign, just closed, the workers of the Curtiss shops went over the top with a subscription of $1,035,000. In addition, the voluntary purchases of War Savings Stamps have average $75.00 a day.

"The only other important local mention of

THE NEWS OF THE WEEK

Liberty Motor and Thomas-Morse Scout Attract Air Service Recruits

The celebrated Liberty Motor was shown recently to the public for the first time in America as far as ascertainable in the window of the A. I. Namm & Sons department store, on Fulton Street, Brooklyn, N. Y. The display was arranged in connection with the recruiting campaign for the Air Service, conducted in Greater New York by Major Willard Wadsworth, Department Air Service Officer, for that district.

The model attracted widespread attention and interest. It was viewed by thousands of people, who on several occasions so completely blocked the sidewalks that police intervention was necessary. As a recruiting "stunt" it provided gratifying results. Hundreds of young men enrolled at the recruiting booth, which was opened in the store through the courtesy of Mr. Herman Neaderland, Advertising Manager.

In addition to the Liberty Motor there was also on display in the window a Thomas-Morse Scout plane, a Curtiss OX2 Motor and a Gnome Monosoupape. Every part of the aeroplane was labelled and described, so that the layman could get an idea of the terms used. The Thomas-Morse Scout created much interest because of the Aviation Carnival held a few days previous at Belmont Park, in which so many machines of this type took part.

The recruiting campaign for the Air Service is being conducted throughout the United States under a new authority. More than thirty thousand men are to be inducted as soon as obtainable. Trade Test Boards where applicants may apply for qualification are located in the following places:

New York City, 104 Broad Street; Atlanta, Ga., Georgia School of Technology; Boston, 739 Boylston Street; Chicago, 230 East Ohio Street; Dallas, Camp Dick; Fort Sill, Okla., Post Field; Los Angeles, Marsh-Strong Building; Minneapolis, University of Minnesota; San Antonio, Fort Sam Houston; San Francisco, 55 New Montgomery Street; St. Louis, 525 South Euclid Avenue; Canal Zone, Camp Sheridan.

The Air Service is seeking skilled mechanics in practically every mechanical and technical branch. The trades listed include the following: cabinet makers, electricians, motorcyclists, instrument repairmen, carpenters, riggers, propellermakers, chauffeurs, automobile mechanics, tailors, armorers, clerks, engine repairmen, stenographers.

Joffre Tribute to Wright

Paris.—Marshal Joffre pays tribute to the memory of Wilbur Wright in a letter to Baron d'Estournelles de Constant, Chairman of the committee for the Wright Memorial Celebration at Lemans.

"Wilbur Wright," says Joffre, "by his memorable experiments at Camp d'Ouvours made it possible for aviation to become a great and glorious factor in this war. We cannot forget that the first Americans who fought for us were aviators of the Escadrille Lafayette. Lafayette and Wright are two great makers of the Franco-American Entente."

Fonck's 75th Victory

Paris.—The official communication on aerial operations issued November 5 says:

Since November 2 Lieut. Fonck (the premier French ace) has downed six enemy machines, which brought the number of victories for this pilot up to seventy-five.

New Field Publication

AERIAL AGE takes much pleasure in announcing that a new field publication under the name of *The Rich Field Flyer* is to be added to the fraternity of aviation publications.

This publication is in magazine form and is published at Rich Field, Waco, Texas.

It is printed on very fine paper and is quite a pretentious venture. It contains quite an assortment of subjects, and taken as a whole is just another specimen of the "go ahead" spirit which prevails in the American camps.

The Managing Editor of *The Rich Field Flyer* is Lieut. John K. Gowen, Jr., and the exchange of publications is in charge of Lieut. F. L. Samuels.

Invitations to Aviators

The War Department authorizes the following:

Cities and towns of the Southwest under the air lanes used by Army flyers are rivaling each other in their hospitality to aviators. They are building landing fields, organizing the inhabitants into reception committees and raising money for entertainment. One town, which calls itself "The Dynamo of Central Texas," is sending out invitations by cards to flyers. The cards read:

"Upon presentation of this card all courtesies will be offered you, including shower and pool baths at the Y. M. C. A.'s $87,000 plant, country club's $75,000 plant, Elks Club's $47,000 plant. Coffee and sandwiches will be handed out by the Red Cross canteens; hair cut, shave and shine given free at any barber shop; cold drinks at the soda water fountains, also local carfare."

A Big Photographic Map

The War Department authorizes the following:

What is said to be the largest photographic map ever made in this country is just being completed of the territory in and around Fort Sill, Oklahoma, by the Photograph Section of the Air Service attached to Post Field. This map shows not only highways, lanes, trees, buildings, railroads, fances, and every landmark, but indicates every elevation and depression in the terrain. With over 4,000 separate prints pasted into one huge mosaic, the finished product covers a space sixteen feet long and six feet wide, representing a ground area of 310 square miles. The map takes as its center point the town of Lawton, which lies three miles south of Post Field, extending from this point east and west three and five miles respectively, and from the northern boundary of Fort Sill reservation, thirty-one miles south to a point below the town of Walters.

When work was started on this map, slightly over a month ago, the territory was plotted out on a ground map, and by figuring the exact area possible to cover with three magazines of plates, allowing for the proper overlaps, zones or strips of country were established to be covered on every aerial flight. Observers were sent up with assignments to cover specified zones or strips, and as fast as the finished negatives showed that these strips had been covered satisfactorily, the work proceeded to unfinished zones. Three planes went up daily at the start and negatives were produced with great rapidity. A summary of the negatives made shows over 4,200 separate exposures, but the number of prints, allowing for overlapping, spoilage, etc., will, of course, exceed this number. Figuring three magazines, or 72 exposures, on each flight, approximately 60 trips, averaging an hour and a half per trip, have been necessary to produce the map—or total flying time of some 90 hours.

Marine Flying Corps Notes

The first aviation unit organized in America and sent abroad using American-made material was the First Marine Aeronautic Company, equipped for water flying only, which is now stationed abroad at a naval base. This information is given in an announcement of the progress of Marine Corps aviation, which has just been made public at Marine Corps Headquarters.

In addition to the flying field maintained at Miami, Florida, where all training in actual flying is given, the aviation section of the Marine Corps gives candidates instruction in ground work at the Massachusetts Institute of Technology, Boston, Mass., and has two schools for instruction in aviation mechanics.

The course in actual flying at the Marine Flying Field, Miami, which covers a period of 75 days, includes preliminary, acrobatic and formation flying. All students receive instruction in bombing, gunnery and reconnoissance work. The reconnoissance work, the most hazardous feature of aviation, includes following up bombing squadrons for making photographic records. In obtaining these photographic records, the aerial photographers must make their way to the scene of activity and not only record the result of the bombing but evade the prepared enemy fire as well.

At the Massachusetts Institute of Technology, where all ground work instruction is given, there are now 289 students. One hundred and thirty-two men are in classes and 157 are awaiting assignment. When Marines are assigned to this

"High Fliers These." This picture made at North Island, San Diego, California, shows Lieutenant Barrett, former trainer of the New York Yanks, and Ensign Sullivan, of the Chicago Cubs, ex-infielder. They are now trainer and manager of the Army and Navy Aviators Baseball Club as well as aviators

School, they are enrolled as gunnery sergeants for the duration of the course and receive the pay allotted to this rank. Those who show themselves to be promising material are made officers after completing their training as flyers. The ground course lasts about 10 weeks, and 80 men are graduated each month. No break is allowed in the supply of men to the school, by keeping 100 men in reserve to be passed upon by aviation officers. If a man fails to be graduated, he has the option of being transferred to training for regular duty in the Marine Corps, or being discharged.

Of the two schools for mechanics, the larger is maintained at the Naval School for Mechanics, Marine Corps Section, Great Lakes Training Station, Chicago, Ill. Here Marines are trained as mechanics, riggers and armorers. At present there are 120 enlisted men taking the course at Great Lakes, and 60 men are sent each month from the Marine Corps. The total number of men allotted to the Marine Corps at one time is 360.

The second school for aviation mechanics is located at the Naval School, Marine Corps Section, San Diego, Cal. The training is the same as given at the Great Lakes School. Ninety-three enlisted Marines are taking the course at the present time. The capacity is 120.

Seaplane in Air Nine Hours

Washington.—A record flight made by a navy seaplane equipped with a Liberty motor is described in a report received November 2 by Secretary Daniels from Vice-Admiral Sims.

The plane remained in the air nine hours, carrying a full military load, four men, the regulation supply of gasolene, two bombs weighing nearly 500 pounds and two machine guns.

Flyers Carry Rations to Our Fighting Men

Washington.—American aviators now are delivering Red Cross emergency rations to American soldiers in the front lines who are pursuing the enemy at such a rapid pace that they have out-distanced army supply wagons. A despatch from France to the American Red Cross said by flying low the aviators are enabled to drop packages and newspapers at points where the soldiers are certain to get them.

New Commander at Chanute

Chanute Field.—With the departure of Commanding Officer Major Wilbourn, who was promoted to the rank of Lieut. Colonel just before leaving Chanute Field for Camp Green, S. C., Major A. H. Gilkeson has become chief officer in charge. He relieves Capt. Lewis who was the temporary C. O. and is expected to be permanently maintained as the new Chanute Field commander. He is a West Point man and not a stranger at the local field, having been commanding officer of the old 38th Squadron early last fall. Up until a few weeks ago he was stationed at Wilbur Wright field, coming here to take up the duties of flying officer. Lieut. Bretting moves up to the flying officer's berth with the promotion of Major Gilkeson to post commander.—*Rantoul Weekly Press.*

Chanute Field Has Aero Ambulance

The new aero ambulance, a Curtiss aeroplane equipped to carry one patient besides the driver, was on the field Sunday ready for its first trip in the air. The fuselage of the machine is so arranged that a stretcher bearing a wounded soldier can be placed into it securely for quick transportation to the nearest field hospital. The object of the machine is to equip the post hospital for such cases where a plane should fall where access to the spot would be impossible by ambulance.—*Rantoul Weekly Press.*

Omaha Selected as Overland Air Port

Omaha, Neb.—Omaha has been definitely selected as an air port for the Woodrow Wilson transcontinental aero mail service, according to army officials at Fort Omaha.—*March Field Flyleaf.*

Airman Fights off 60 Foe Machines

One of the most gallant deeds in the record of the British air force has been added in a battle recently fought in the Mormal Forest by a British Major, working singlehanded.

The Major had engaged a German aeroplane, and almost before he realized it was surrounded by a great flight of enemy machines, which attacked him fiercely from all sides. A battle royal ensued, which lasted about an hour, during which he had given battle to between fifty and sixty machines.

Early in the fight the Major sustained three crippling wounds. Unconscious at times, he continued to fight, until by brilliant manoeuvring he managed to escape to his own lines. He had destroyed four hostile planes and driven down out of control between four and six.

Once during the mad battle the Major concluded he was lost and deliberately charged a Boche with the expectation that both machines would crash and end it. He was working the machine-gun as he swept toward the enemy. Just as a collision seemed inevitable, the German machine burst into flames and dropped.

Chick Evans to Be an Aviator

Chicago.—Charles "Chick" Evans of Chicago, national amateur and open golf champion, has received word that he had been accepted for aviation service. Evans is twenty-eight years old and had been placed in deferred classification because of dependent parents, but he only recently succeeded in adjusting his affairs so he could enter the service.

Washington Reads Returns in Sky

A solid bar of light two miles long and three feet in diameter, projected straight into the sky by an army searchlight of approximately 1,750,000 candlepower, kept Washington and portions of Virginia and Maryland informed on the night of November 5 that election results were in doubt.

The searchlight was to flash a stream of light east and west if the Democrats won and north and south if the Republicans carried the day.

The thirty-six-inch searchlight from Washington Barracks was mounted on a huge army truck and taken to the corner of Thirteenth street and Pennsylvania avenue. The crew in charge were members of the Seventy-third engineers. Lieut. R. T. Alten directed the operation of the searchlight, assisted by Lieut. J. H. England, Sergeant Flansburg, Sergeant Patterson, and Privates M. L. Griswold, F. J. Mouler, J. J. More, L. Brack, A. H. Baumgart, F. H. Spector. Capt. S. R. Hursh and Capt. R. T. Kendall were detailed by Col. G. R. Lukesh, commanding the Seventy-third engineers, to observe the operations of the searchlight in regard to atmospheric conditions.

When the proper focus was made the huge stream of light was thrown straight into the air. So powerful was the glare that the rays penetrated two cloud layers.

Lieut. James C. Edgerton, army aviator stationed at Bolling Field, Anacostia, made two flights over the city, droping flares to announce for *The Times* the doubt regarding the result of the election.

When he went up for the first flight no definite returns had been made, so white flares were dropped, indicating that the result was in doubt. The plane left Bolling Field at 8:31, circled the field twice for altitude, and headed north toward the heart of the city.

The plane was dark, and for a time the two searchlights at Washington Barracks were unable to find the aviator. On his first trip five white Very lights were dropped.

Edgerton, after shooting his flares, flew through the beam of the searchlight, which, however, lost the plane. Turning, the plane again shot into the beam of light, and from then on until just before the landing was made, the machine was kept in full view of the thousands who were watching it.

British Aeroplane Takes 65 Germans Without Landing

London.—Two British aviators, flying low in one machine, recently brought about the surrender of sixty-five Germans, and without leaving their aeroplane shepherded the party across No Man's Land to the British lines, according to a story from the battlefield made public on September 24.

The pilot and his observer had been attacked from a trench and sunken road. The pilot dived and replied to the enemy fire with his machine guns, killing one and wounding three. The Germans in a panic ceased firing and hoisted a white handkerchief.

As there was no British infantry in that neighborhood, the pilot descended to within fifty feet of the ground and motioned the Germans out of the trenches, circling around them to insure that none escaped. All were safely brought in and handed over to the nearest British troops.

The aviators then resumed their patrol.

The famous Spad, French combat machine, equipped with 200 h.p. Hispano-Suiza motor, used by the leading French and American Aces on the Western front. Lieutenant Fonck, who has over 75 German planes to his credit, Lieutenant Nungesser, who has over 40 German planes to his credit, and Adjutants Madon, Douchy, and other noted members of the famous Stork squadron, fly Spad biplanes entirely

The AIRCRAFT TRADE REVIEW

They Call Each Other by Their Real Names

AERIAL AGE is in receipt of the following letter from the Standard Aero Corporation of Elizabeth, N. J., which serves to show the amicable feeling which obtains in that plant between the different departments.

Your Editorial Department will be interested in the attached reproduction of a memorandum from the files of the Standard Aircraft Corporation.

You will notice that the original was dictated by Captain D'Annunzio while he was stationed at the Standard Aero Corporation during the building of the first American Caproni. The reply which Mr. Mingle made is characteristic.

The entire document is a very human one and should make a bright spot in your pages.

To Mr. R. C. Taylor,
Standard Aircraft Corporation.

As the noise and heat surrounding me in this office is about to give me hydrophobia, before I bite someone, kindly give me without delay some office room elsewhere, where the heat will not be so great. G. D'ANNUNZIO.

Reply:

Kindly furnish Captain D'Annunzio with a muzzle and chain until satisfactory office facilities can be afforded him.
H. B. MINGLE.

Burgess Aeroplane Plant No. 2 Burns

Marblehead, Mass.—Plant No. 2 of the Burgess Aeroplane Company, which was filled with Government aeroplanes, was destroyed by fire on November 7. The fire was started by an explosion in the paint shop of the Burgess company.

The plant had been shut down in order to permit the workmen to celebrate upon receipt of reports of the signing of an armistice by Germany, and before the watchman could reach the scene the flames had gained great headway. Aeroplanes in various stages of construction were quickly ruined.

Insurance officials estimated the total loss at $300,000. It was thought the fire was caused by spontaneous combustion.

Liberty Motors Being Made Fast

Washington.—The actual output of Liberty motors in October was 3,878, according to an announcement authorized by the War Department. This is an increase of 1,500 over September. The Air Service expected 2,500 motors in September and deliveries were short 122. The quota for October called for 3,000.

The factories producing the motors are expected to turn out a minimum of 4,350 during November. With the big plants now in full operation, it is expected that the November figures will be far ahead of the number called for.

Wins Liberty Motor Flag

Indianapolis.—The Nordyke & Marmon Company of this city won the first honor pennant offered by the United States Government to the concern building and shipping 12-cylinder Liberty motors the most rapidly in October, it was announced here on November 1. The contest began October 1 and ended November 1 at midnight. The company made a production record of 225 per cent of its alloted quota in October. The contests are to be continued each month. Five other firms contested during October.

The flag was presented November 2 at one of the Indianapolis parks. It will remain at the plant of the winner until won by another concern.

New 24-Cylinder Aviation Engine in Production

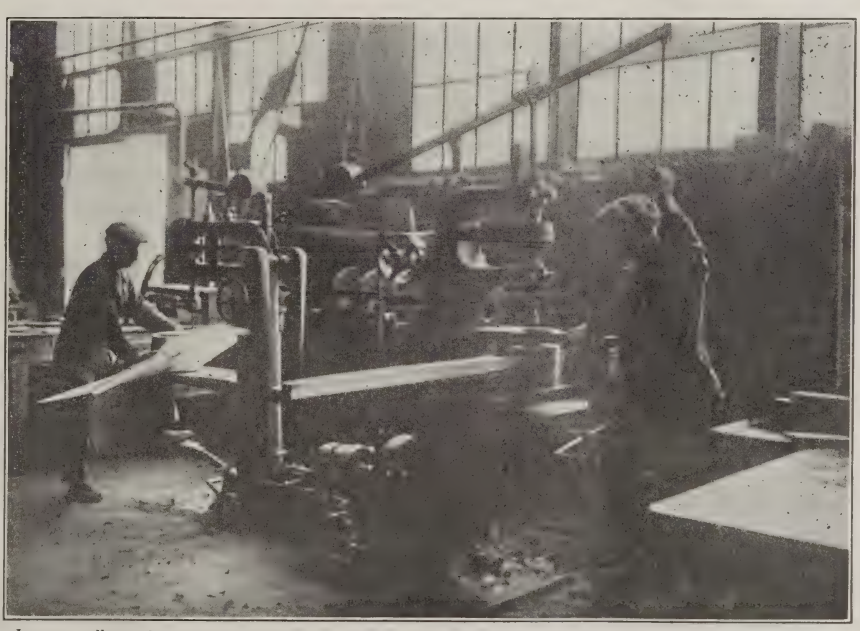
Racine.—The Sieverkropp Engine Co. has started work on the construction of a 24-cylinder, two-cycle, rotary aviation engine, which is expected to develop 500 h. p. at 1,400 r. p. m. The engine is of a new type recently developed by Henry Sieverkropp, president and chief engineer of the company. The 24-cylinder engine is being built at the suggestion of the technical division of the Government aircraft board, on the basis of the performance of a smaller experimental engine completed by Sieverkropp about two months ago and submitted for official tests. The engine already constructed is a 12-cylinder, two-cycle, rotary type, rated at 72 h. p., but it has developed 140 h. p. at 2,800 r. p. m., without appreciable effort. Mr. Sieverkropp is confident that the 24-cylinder motor will weigh considerably less than 1.98 lb. per horsepower and by the use of aluminum cylinders and other economies in weight expects to reduce the ratio to practically 1 lb. per horsepower.

To Make Aeroplane Parts

Detroit.—The newly incorporated B. & H. Machine Products Co., 1161 Ellery Street, will confine its efforts to government machine production work entirely, manufacturing parts essential to aeroplane and truck engines.

Du Pont Heads Flint Varnish

Detroit.—W. W. Mountain, president and general manager of the Flint Varnish & Color Works, has resigned as the company's chief executive officer and member of board of directors to become associated with John N. Willys. The board has also accepted the resignations of James E. Kepperly as vice-president and director and B. A. Greene, secretary and purchasing agent. The former is general manager of the Curtiss Aeroplane & Motor Co. of Buffalo. The latter will become affiliated with Dort Motor Co. Lamot Du Pont, vice-president of the E. I. Du Pont de Nemours company, was elected to the presidency to succeed Mountain. S. J. Sohlinger, who has been vice-president and assistant general manager for nearly 2 years was made general manager of the company and elected to the board of directors. F. M. Howard, treasurer, was also elected to the board.



No Aeroplane Show Next Year

New York.—The Manufacturers Aircraft Association has abandoned plans for its annual show during the coming year. The directors last week adopted resolutions against such a show because of the necessity for devoting all time and energy to government requirements

Standard Holds Rally

At 12 o'clock noon, November 1, 1918, a rally was held at the plant of the Standard Aircraft Corporation, Elizabeth, New Jersey, at which rally the 100 per cent Liberty Loan Flag, which has been awarded to the Standard Aircraft Corporation was unfurled.

Mr. H. B. Mingle, President of the Standard Aircraft Corporation, spoke, as did Mr. J. M. Meirick, Publicity Superintendent, who had been directly in charge of the Liberty Loan drive.

In a propeller making plant. The war has demanded so much of manufacturers that existing plants had to be adapted as best they could to war use. Here are shown metal hub flanges being fitted. A divergence of opinion in propeller manufacturing methods centers around the hub! One school bores the hub hole and fits the flange in the nearly finished product. Another school bores the hole in the roughly glued block, and using this hole for the supporting axis, shapes the propeller from the base center

Aeroplane Mail at 43c. Per Mile

The Post Office Department authorizes the following: The first report of the comparative cost of the operation and maintenance of the Aero Mail Service shows that the aeroplanes used in this service have broken all records for economy of gas consumption.

The total of all operating expenses of nine aeroplanes covering flights aggregating 7,234 miles was $3,682. The total consumption of gas representing 113 hours and 8 minutes of flying was 1,377 gallons, which is $32.50 per hour—something over 50 cents per mile. The total cost of gas was $405 in flying 7,234 miles.

The best performance in flying was made by a Curtiss J-N-4 machine, which flew 26 hours and 40 minutes at a cost of $28.01 an hour, and covered 1,719 miles at a cost of 43½ cents per mile. A plane equipped with an Hispano-Suiza 150-horsepower engine used approximately 8 gallons of gas per hour, and a plane equipped with a 400-horsepower Liberty motor used 17 gallons per hour. This shows 40 per cent. less gas consumed than generally required for aeroplane engines of these sizes.

Kipling's Dream May Be Reality

Kipling's dream of the "Flight of the Night Mail" will be a reality within three years, according to Capt. B. B. Lipsner, in charge of the government's aerial mail service. The idea that mail cannot be rushed from coast to coast, and from the Canadian border to the Gulf of Mexico in giant aeroplanes in all kinds of weather will soon be established, Capt. Lipsner declares.

The excellent service and perfect score maintained in the mail delivery between New York, Philadelphia and Washington during the past month has led Capt. Lipsner to a firm conviction that a nation-wide aerial mail service is not impossible.

It is proposed to have a sunrise to sunset mail service between New York and San Francisco, using the aeroplane equipment of the Army, now in service in France and building in this country, with Chicago as the hub of the gigantic system. Capt. Lipsner also believes that the railways will be eliminated from carrying first-class mail immediately after the war, as the fastest train service is now too slow, in comparison to what aeroplanes have been doing and can do.

Captain Lipsner has been in Chicago to complete plans for the opening of the aerial mail service between New York and Chicago, November 1. Most of the cities along the route to be traversed have already established landing places and hangars, and are eager for the service to get under way.

Flying by night will be a regular thing in the aerial mail service, the plane chief believes, and upon this bases his opinion that a sunrise to sunset mail service between Atlantic and Pacific coast cities is possible.

The plane now being built for service on the short eastern route will be able to fly in all kinds of weather. The present weight carrying limit is 700 pounds, but it is hoped that the new planes will carry nearly five tons of mail. It is proposed to equip the new planes to fly 125 miles an hour. It will cost approximately $50 an hour to operate such a plane.

Aerial Mail Notes

SPAIN

Capt. Herrera, one of the pioneers of the Spanish military air forces, has had a number of interviews with King Alfonso at Madrid on the subject of an aerial postal and passenger service between Spain and United States. The scheme has also been discussed at Cabinet meetings, and it is said that a leading shipping company is willing to finance it.

The plan, it is understood, is to manufacture large airships capable of carrying forty passengers besides the mails. The rate charged for a passenger, if the scheme is carried out, will be $400, and letters will be charged for a the rate of $1 per hundred grams weight (about three and a half ounces). It is estimated the journey would take two days and a half.

AUSTRIA-HUNGARY

It is understood that the aerial mail service between Budapest and Vienna has to come to an end owing to the collapse of the aeroplane at Magyarovar; the two officers were killed and the mail burned. According to the Vienna "Fremdenblatt," the officers whilst conveying mails from Budapest to Vienna were attacked by an eagle, which was killed by the airscrew. One is not very surprised to hear that the aeroplane collapsed under those circumstances.—R. M.

Thanks for Them Kind Words

Regarding the American aero mail service the *London Aeroplane* says:

"During the month of August the aerial mail service between Washington, Philadelphia and New York was conducted without a miss or serious delay of any character. This tends to show how the Americans are working to perfect their aeial mail system.

"Since the inauguration of the United States aerial mail service the American authorities have realized the great possibilities of this new work, and, aided by a sensible Congress who are prepared to supply machines, they bid fair for going to the top of aerial mail affairs unless other countries wake up."

OTTO PRAEGER, Second Assistant Postmaster General

MILITARY AEROSTATICS

By Lieut. H. K. BLACK, R. F. C., C. F. A.

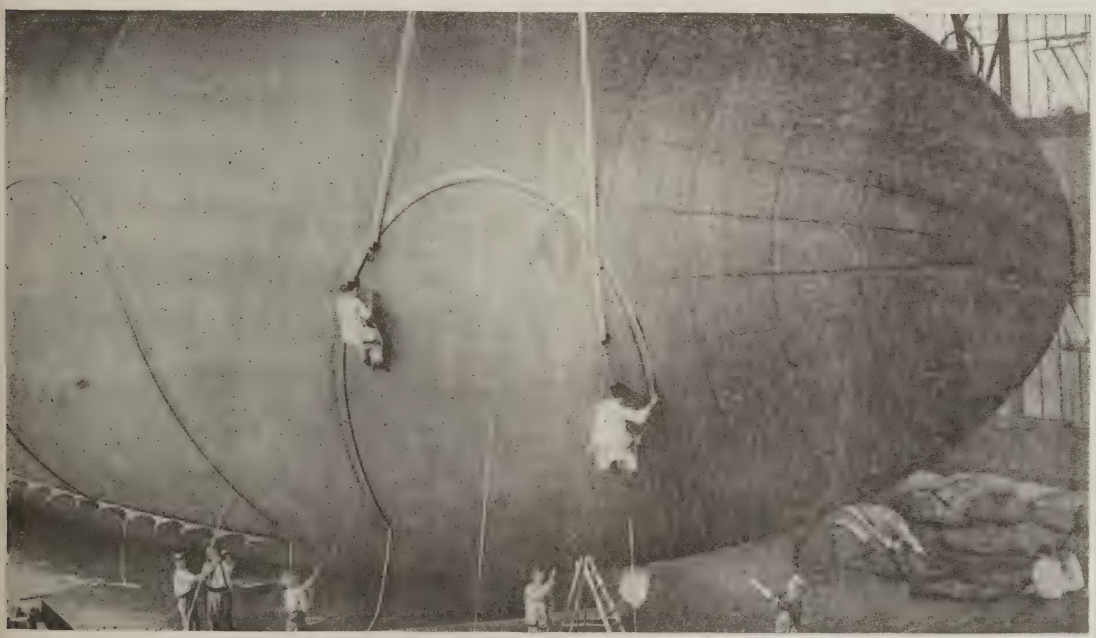
DURING the past week AERIAL AGE has been asked to say something about the permeability of balloon fabrics. There have been several inquiries to this office about it in the last few weeks, so perhaps a few facts about this subject will be in order just now, particularly as one inquirer wishes to take advantage of the information immediately. It had been intended to go into the subject of permeability in the course of the next few weeks, but in the meantime here are a few facts in advance.

Permeability of Balloon Fabrics

A great many materials have been suggested for rendering fabric gastight; the great majority of balloon envelopes, however, are made from rubber-coated silk or cotton, usually the latter. For the balloon envelope two piles of cloth are used with the gastight rubber film between them. The two plies may be placed parallel to each other or one ply may be placed at an angle of 45 degrees; the biased favric is supposed to offer greater resistance to tearing. Usually from 100 to 130 grams of rubber per square meter are placed between the plies. For protecting the fabric and the gas-retaining rubber film from the action of light, heat, moisture, etc., rubber coatings may be applied on the outside; further protection is sometimes added by coating the inside of the fabric also. Lighter single-ply fabrics are sometimes made for use in ballonets and three-ply fabrics find use in large dirigibles or supply balloons.

Goldbeater's skin finds some application in dirigible balloons of the rigid type. Oiled fabrics of various kinds, as well as fabrics coated with lacquers made from cellulose acetate or nitrate, have been tried. Various coatings have also been applied to rubberized fabrics with a view to rendering them more nearly gastight and increasing their durability. However, none of these has been found entirely successful.

Gas escapes from a balloon envelope through leaks at valves, seams, and imperfections in the fabric, and by passage through the fabric. Hydrogen might pass through the fabric by diffusion through minute holes in a manner similar to the passage of a gas through a porous plate or it might escape by solution in the rubber film with subsequent evaporation from the other side. As a matter of fact, both processes occur simultaneously. The escape of hydrogen through openings in the fabrics is only a case of gas effusion, but the passage of hydrogen through the rubber of the fabric is a very different phenomenon.



Thomas Graham, in 1866, investigated the flow of gases through rubber films and showed that it was a solution phenomenon and not a diffusion phenomenon. If gases passed through rubber films by diffusion through microscopic holes, their relative rates of escape should be approximately inversely proportional to the square roots of their densities. Graham showed, however, that the rates of penetration of different gases bore no relation to their density. He found the relative rates of penetration of rubber by different gases to be as follows:

Nitrogen	1.0
Methane	2.15
Oxygen	2.56
Hydrogen	5.50
Carbon dioxide	13.58

The rate of change of permeability of rubber films with change of temperature is also much greater than can be accounted for by the diffusion theory. These and other facts have shown that gases penetrate rubber by first dissolving in the rubber.

When a rubber-coated balloon fabric is placed in contact with hydrogen on one side and air on the other, the following process is substantially what occurs. Both the hydrogen and the oxygen and nitrogen of the air dissolve in the rubber film and tend to saturate it up to the limits determined by the temperature and by the partial pressure of each gas. Each gas penetrates the rubber film at its characteristic speed, and when it reaches the opposite side of the rubber film the gas evaporates from its solution in the rubber because the partial pressure of the gas in question is substantially zero. More of each gas is dissolved continuously on the first side of the fabric and a dynamic equilibrium is reached which continues so long as fresh air and fresh hydrogen are available at the two surfaces. In this manner hydrogen passes through the rubber to the air side and air passes through to the hydrogen side.

(To be continued.)

The ground crew of a dirigible making repairs to the envelope while the dirigible is in its hangar. The workmen are slung in cradles from above

POWER CURVE FOR THE AERIAL PROPELLER

By S. E. SLOCUM, Ph. D.

Professor of Applied Mechanics, University of Cincinnati. Member S. A. E.

IN a previous article, entitled "Characteristics of the Aerial Propeller" (AERIAL AGE WEEKLY, August 26th, 1918), the writer derived from experimental data on model and full-size propellers obtained by M. Eiffel and Captain Dorand, a relation expressing propeller thrust in terms of the diameter and speed of the propeller in r.p.m. The characteristic feature of this derivation was that no assumption was made as to the theoretical relation existing between the various quantities involved, but the actual law governing propeller thrust was evolved from the experimental data by the method of Least Squares. The resulting law was as follows:

In metric units,

$$F = N^{2.261}\, D^{4.254} \left[.008542 - .01 \left(\frac{V}{ND} \right)^2 \right],$$

or in English units,

$$F = \frac{N^{2.261}\, D^{4.254}}{50{,}000} \left[6 - 7 \left(\frac{V}{ND} \right)^3 \right],$$

where F = propeller thrust in kg. or lbs.,
N = propeller speed in r.p.m.,
D = propeller diameter in m. or ft.,
V = air velocity in m./sec. or ft./sec.

This particular formula, of course, is conditioned by the particular type of propeller used in the experiments. The method of derivation, however, is perfectly general and affords a much more accurate and reliable basis for the discussion of experimental results on propellers than is possible when it is attempted to make the results conform to a theory which is known to be in error.

In discussing his exerimental results, Eiffel assumed from theoretical considerations that the thrust varied as V^2D^2, or, what amounts to the same thing, as N^2D^4, and also that the power absorbed varied as N^3D^5, but when he came to represent his results graphically, he obtained in each case a series of parallel curves, which means, as he himself notes, that the theoretical assumptions are in error. Since then, however, all discussions of propeller data seem to have followed Eiffel's assumption. The present article shows how far these assumptions may be in error in a particular case.

In what follows, the same experimental data used in the preceding article are retained as a basis for the determination by the method of Least Squares of the power absorbed by the propeller.

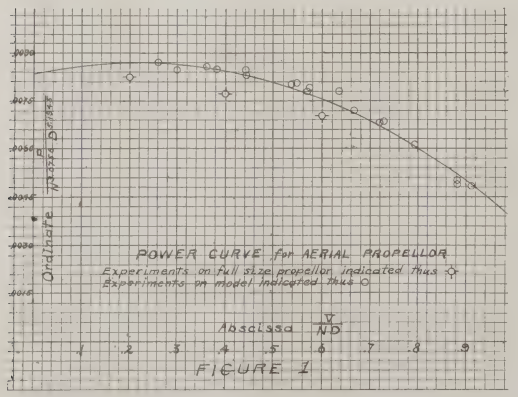


FIGURE 1

The propeller used in these experiments was a Drzewiecki screw, with a constant angle of incidence of 5 degrees, and a width of blade equal to one-sixth the radius. The diameter of the model propeller was .905 m., and of the full-size propeller was 2.715 m.

As in the preceding article, the combination $\frac{V}{ND}$ will be used as abscissa, and the form of the expression for the ordinate developed from the given data.

The experimental data determined by Eiffel and Dorand are given in the left half of the following table. In the right half of the table are certain quantities computed from these data, as explained in what follows:

EXPERIMENTAL DATA Model (Eiffel)			COMPUTED DATA Model (Eiffel)		
Speed N rev. 'sec.	Velocity V m. 'sec.	Brake Power P kgm.'sec	V / N D	P / $N^{3.0756}\, D^{5.4945}$	P / $N^{3.0756}\, D^{5.4945}$

The first step is to determine the relation between the power absorbed and the speed in r.p.m. For this purpose let

P = power absorbed by the propeller in kgm./sec.,

and write the general relation

$$P = XN^kD^m = R\,N^k$$

where X, k and m are unknown quantities to be determined, and

$$R = X\,D^m.$$

Reducing this expression to the linear form by means of logarithms, we have

$$\log P = \log R + k \log N.$$

Substituting in this relation the data from the first four experiments, in which V = O, we obtain the four following observation equations:

$$.775974 = \log R + k$$
$$1.367356 = \log R + 1.195900\ k$$
$$1.761176 = \log R + 1.322219\ k$$
$$2.086360 = \log R + 1.425969\ k$$

These four equations involve two unknown, log R and k. The method of obtaining the most probable value of these two unknowns according to the method of Least Squares consists in reducing the observation equations to a pair of normal equations; the normal equation for log R being obtained by multiplying each observation equation by the cofficient of log R in this equation and adding the results; and similarly, the normal equation for k being obtained by multiplying each observation equation by the cofficient of k in this equation and adding the results. The resulting normal equations are

$$\begin{cases} 1.497716 = \log R + 1.236022\ k \\ 1.560437 = \log R + 1.256415\ k \end{cases}$$

whence

$$\begin{cases} \log R = -2.303806 \\ k = 3.07561 \end{cases}$$

The effect of propeller diameter on power is next considered by comparing corresponding experiments carried out on the model and on the full-size propeller. Since the model is one-third the size of the full-size propeller, its speed in r.p.m. should be three times as great to develop similar characteristics. The following two sets of data are therefore chosen for comparison:

Full-size Propeller	Model
D = 2.715 m.	D = .905 m.
P = 1300 kgm./sec.	P = 122 kgm./sec.
N = 540 r.p.m.	N = 1600 r.p.m.

Writing the general equation in the form

$$\frac{P}{N^k} = R = X\,D^m$$

substituting the above numerical values, and taking the ratio of the two expressions, we have

$$\frac{1300}{122}\left(\frac{1600}{540}\right)^{3.07561} = 3^m$$

whence $m = 5.19455.$

Note that this value of m is obtained from only two experiments and is therefore liable to a large probable error. This is unavoidable at the present stage of the calculations, but when the final results are obtained, a means will be found for checking this value, and it will be found necessary to modify it somewhat.

Since

$$X\,D^m = R,$$

by substituting the values of m and R just obtained, we find

$$X = .008344.$$

For V = O we have, therefore,

$$P = .008344\ N^{3.07561}\ D^{5.19455}$$

Now by plotting the given data it is found that a parabola can be made to conform closely to the power curve. The general relation expressing the power in terms of speed and diameter may accordingly be assumed to have the form

$$\frac{P}{N^{3.07561}\ D^{5.19455}} = .008344 + Y\left(\frac{V}{ND}\right) + Z\left(\frac{V}{ND}\right)^2,$$

where Y and Z are undetermined coefficients.

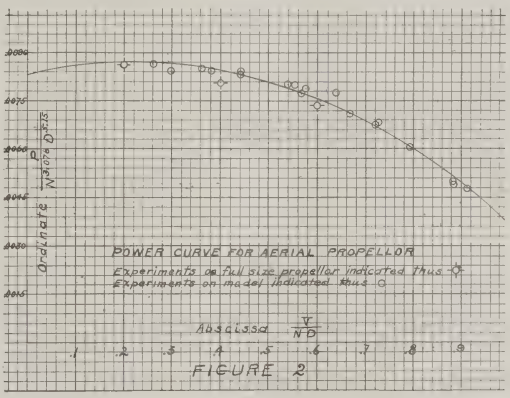
To find the most probable values of Y and Z, substitute the functional values calculated from the experimental data as tabulated in columns 4 and 5 of the table in the above expression, thus obtaining the following set of 21 observation equations:

$$\begin{aligned}
0 &= +.0004413 + Y\,(.577) + Z\,(.577)^2\\
0 &= -.0001144 + Y\,(.384) + Z\,(.384)^2\\
0 &= -.0001273 + Y\,(.298) + Z\,(.298)^2\\
0 &= -.0003626 + Y\,(.262) + Z\,(.262)^2\\
\\
0 &= +.0033484 + Y\,(.885) + Z\,(.885)^2\\
0 &= +.0005552 + Y\,(.571) + Z\,(.571)^2\\
0 &= +.0000312 + Y\,(.443) + Z\,(.443)^2\\
0 &= -.0002244 + Y\,(.362) + Z\,(.362)^2\\
\\
0 &= +.0015420 + Y\,(.719) + Z\,(.719)^2\\
0 &= +.0002905 + Y\,(.546) + Z\,(.546)^2\\
0 &= -.0001207 + Y\,(.442) + Z\,(.442)^2\\
\\
0 &= +.0034099 + Y\,(.886) + Z\,(.886)^2\\
0 &= +.0011406 + Y\,(.668) + Z\,(.668)^2\\
0 &= +.0003146 + Y\,(.539) + Z\,(.539)^2\\
\\
0 &= +.0022499 + Y\,(.794) + Z\,(.794)^2\\
0 &= +.0005357 + Y\,(.637) + Z\,(.637)^2\\
\\
0 &= +.0035321 + Y\,(.913) + Z\,(.913)^2\\
0 &= +.0014893 + Y\,(.727) + Z\,(.727)^2\\
\\
0 &= +.000108 + Y\,(.2) + Z\,(.2)^2\\
0 &= +.0006268 + Y\,(.4) + Z\,(.4)^2\\
0 &= +.0013077 + Y\,(.6) + Z\,(.6)^2
\end{aligned}$$

From these observation equations form the normal equations for Y and Z in the usual way, according to the method explained above. The resulting normal equations are then as follows:

$$\begin{aligned}
0 &= .0159494590 + 7.564893\ Y + 5.2702055\ Z\\
0 &= .012951103 + 5.2702055\ Y + 3.9077221\ Z
\end{aligned}$$

Solving these simultaneously, the results are



$$\begin{aligned}
Y &= .003319\\
Z &= -.00779045
\end{aligned}$$

and consequently the general relation becomes

$$\frac{P}{N^{3.07561}\ D^{5.19455}} = .008344 + .003319\left(\frac{V}{ND}\right) - .00779\left(\frac{V}{ND}\right)^2$$

Plotting this curve and the experimental data to the same scale, the result is as shown in Figure 1.

Evidently this graph conforms closely to the experiments made on the model, but not so closely to those made on the full size propeller. The reason is that the constant m is based on a single experiment, and an error in the readings for this one experiment will, of course, produce a corresponding error in m. To correct for this error, it is evident that the plotted data for the full-size propeller can be made to approach the graph by decreasing m. As a change in m will produce a change in all the other constants, we will for simplicity take the exponent of N as 3.076, assume a value for m slightly less than 5.19, and repeat the entire process of finding

X, Y and Z. By several repetitions of this process, it is thus found that the most suitable value for m is 5.15, and that the corresponding values of X, Y and Z are

$$\begin{aligned}
X &= .008307\\
Y &= .003647\\
Z &= -.008181
\end{aligned}$$

The modified equation of the power curve in metric units then becomes

$$\frac{P}{N^{3.076}\ D^{5.15}} = .008307 + .003647\left(\frac{V}{ND}\right) - .008181\left(\frac{V}{ND}\right)^2$$

which may be written approximately

$$P = \frac{N^{3.076}\ D^{5.15}}{120}\left[1 + .44\left(\frac{V}{ND}\right) - \left(\frac{V}{ND}\right)^2\right].$$

Plotting this curve and the experimental data to the same scale, the result is now as shown in Figure 2.

Converting this formula into English units, the result is

$$P = \frac{N^{3.076}\ D^{5.15}}{7560}\left[1 + .44\left(\frac{V}{ND}\right) - \left(\frac{V}{ND}\right)^2\right],$$

where P = power in ft. lbs./sec.,
D = propeller diameter in ft.,
V = linear speed in ft./sec.,
N = propeller speed in r.p.m.

The results presented in this article show a considerable deviation from the theoretical assumption that the power varies as $N^3\ D^5$, as well as from the assumption that the thrust varies as $N^2\ D^4$. Furthermore, it is apparent that it is a comparatively simple matter to determine the actual law governing any set of experiments without recourse to any assumptions whatever.

AERIAL PHOTOGRAPHS FROM THE

Aerial photography has been one of the most wonderful developments of the war. Without it the artillery would be sadly restricted in the observation of their fire, the infantry would be at the mercy of concealed machine guns and the general staff would be at a loss of knowledge of the enemy's movements. An aerial photograph reports things which a human eye would

An aerial photograph of Camp Mills, L. I.

Photograph of Vienna, taken by one of the aviators at a height of 750 meters, showing the manifestos scattering over the city. On the left there is shown Am Hof Place, with the new building of the War Department; in the center is the Graben, popular boulevard and promenade; in the corner, on the right, is the St. Etienne Cathedral. (Italian official photo.)

FOUR CORNERS OF THE EARTH

verlook, sees hrough camou- lage and because t is mechanical, it loes away with the ersonal equation, which so often is iable to color re- orts.

The study and eading of aerial photographs is omething which as been brought o a high stage of erfection. To the uninitiated what eems to be a mere umble becomes to he trained reader f photos a regu- ar mine of military nformation.

SPENCER HEATH, PIONEER IN PROPELLER MANUFACTURE

THE business of the American Propeller & Mfg. Co. was organized in the year 1910 in Washington, D. C., by Spencer Heath, who, as president of the company, is still at the head of its activities.

Mr. Heath at that time was a trained and experienced mechanical engineer who had added the profession of law and was then practicing before the United States Patent Office and in the District and Federal Courts. Before taking up law and patent work Mr. Heath had been employed in various engineering capacities by well known Middle West manufacturing companies, including the Elgin National Watch Company, the Crane Company, Western Electric Company, and others. In 1902 he took a position in the Navy Department at Washington. His duties here included the preparation of plans and specifications for almost every kind and variety of engineering work, both under water and on shore, in connection with naval coal depots in all parts of the world. After some four years of the Navy work, Mr. Heath resigned that position to take up the practice of law, for which he had in the meantime prepared, his previous engineering connections leading him mainly into patent practice. Among his clients in this connection was Mr. Christopher J. Lake, Vice President of the Lake Torpedo Boat Company, who retained him regularly for several years in his patent work.

In 1909 Mr. Heath became interested, in a purely scientific way, in the designing of Aeronautical Screw Propellers. Some interesting developments in this led to applications for patents and to the establishment of a very small shop for amateur construction. No money was ever invested in this shop. The first propellers made were turned into cash so promptly that these returns were used to meet bills, etc., for the preliminary expenses. The demand continued until at the end of 1911 the little shop without machinery of any kind showed a surplus of $4,000.00. During 1910 the propeller work was directed only in spare time from the law and patent work and in 1911 Mr. Heath took position as General Manager and Consulting Engineer of the Gyro Motor Company in Washington, which company was owned principally by Mr. Emile Berliner of that city. Mr. Heath gave to the Gyro Motor Company only four hours per day, taking supervision also of Mr. Berliner's patent work generally during that year and until removal to Baltimore in May of the next year. Parallel with these activities the propeller work continued to grow until it became necessary at the end of 1911 to seek a new location for the manufacturing work.

In May of 1912 Mr. Heath transferred his entire propeller activities to the City of Baltimore, where a small shop was equipped with machinery, etc., in a portion of the premises now included in the company's oldest plant, known as Plant No. 1, at the East Hamburg Street location. During the next four or five years the propeller work carried on in Baltimore was largely experimental and developmental. During this time Mr. Heath's work was under the constant patronage and approval of the Aeronautical Branch of the Navy Department and was also supported almost continuously by the corresponding branch of the War Department, both of which were then comparatively small. This official patronage, together with a considerable trade from the exhibition aviators in the early part of the period, and from experimental engineers in all parts of the country, made it possible to continue this development work without interruption at any time. During the latter part of the period there was also a degree of recognition from abroad, leading to various comparatively small orders for propellers from widely scattered parts of the world.

During the pre-war period Mr. Heath's work in propellers was characterized by two leading

principles: first, the unceasing improvement and development of the propellers themselves as regards design, materials and method of manufacture, and, second, an absolute adherence to the principle of service—engineering and advisory service before receiving orders and the highest technical service and promptness in their execution—and the most thoroughgoing follow-up service to insure that no customer should have any possible cause for complaint. Among the valuable developments made by Mr. Heath may be included the original adoption of the so-called constant angle of attack method or independent aerofoil analysis of propeller sections in 1909, important modifications of the constant angle theory, equally early development and perfection of accurately matched and balanced half-laminations for opposing blades in order to preserve running balance and equal deflection under load, the development and practical use in 1912 on the Navy machines of the method of propeller construction in which the blades are formed of a plurality of thin laminations pressed together and twisted into their proper pitch, and the development of a practical and highly efficient type of variable pitch propeller known as the torsion pitch design, of which upwards of ten thousand have been put into successful use within the past few years. In addition to the customary two-bladed and four-bladed propellers, Mr. Heath was the pioneer in his advocacy and development of the three-bladed type, which prior to the war had found great favor with the flying men of both the Army and Navy, being used for the most part in their expert flying, while the two-bladed propellers were used for their instruction work. In addition to the valuable improvements in propeller design and construction above enumerated, Mr. Heath has devoted himself to the designing and building of special manufacturing machinery, all of which has been built for the exclusive use of his own company. This included propeller-shaping machines in which the form of the blade is automatically developed from a master blade or follower pattern; propeller hub facing and boring machines, in which the hubs are sized and machined parallel on both faces and the center hole bored at a single operation; and outlining machines in which the edge contours of the hubs and blades are precisely formed exactly 180 degrees apart for the two-bladed propellers and 120 degrees apart for the three-bladed.

There was also developed a special machine for forming the peculiar hub jointing to which the three-bladed propeller owes its extraordinary hub strength above any other style.

A further line of investigation and development carried on by Mr. Heath relates to the instruments and facilities for designing, for checking of angles, etc. in process of manufacture and other inspection purposes. These consist mainly in a system of standardized instruments conforming to a rational system of designing, checking and inspection which greatly simplifies the work and eliminates the rude method of checking by surface tables, protractors, etc. which were used before this system and these specialized instruments were developed. With the coming of the war, and particularly with the entrance of this country, Mr. Heath's activities have been primarily along the line of developing high speed and quantity production. In carrying this out he has found it necessary repeatedly to enlarge and expand his company's works, the latest addition being factory No. 4, containing 158,000 square feet of floor space, with the latest improved lumber-drying facilities, independent power plants and electrical generating set.

In all matters pertaining to aeronautics in general and propellers in particular, Mr. Heath is an uncomprising optimist. He regards the aeroplane industry as potentially one of the future large industries of the world, and one that will be so recognized within the next very few years. He looks upon the war as only a passing incident in the development of aeronautics and believes that the lasting and substantial features of the business will begin to arise only after the cessation of the war, and the expansion of the airplane to its proper sphere as an industrial and commercial instrument. He looks with equanimity upon the prospective changes after the war and with entire confidence in the future of aeronautics in the era of peace

(*Continued from page* 516)

the Curtiss company in the Hughes' report is connected with the name of Lieutenant Colonel George W. Mixter. Attorney General Gregory in his summary of the Hughes' report says that Lieutenant Colonel Mixter owned only 25 shares of stock with a par value of $2,500 (market value $28 a share) and that the officer testified that he had sold his common stock but did not remember whether he had disposed of the preferred stock in this very small holding. The charge against Lieutenant Colonel Mixter is not a charge against the Curtiss company.

"It must be remembered that the aircraft industry is new. England began the war with less than 200 serviceable aeroplane. A production method, plants themselves, a shop routine, an engineering technique, had to be created, as it were, overnight. It was a tremendous task. In eighteen months the infant aeroplane industry in the United States reached, under all the handicaps revealed by the Hughes' report, a development which the great automobile industry did not attain for seventeen years.

"With no attempt to criticize any other plant in the industry, the Curtiss management feels gratified that the Hughes' report in its measure clears it and its workers of many false charges and loose incriminatory statements so frequently circulated before the Hughes' inquiry began. These stories are shown to be coins of no value. Under reorganized aircraft production system, the Curtiss family has its sleeves rolled up to reach the largest production from any plant in the world. And that will be a Buffalo achievement."

Honor British Flier Who Has Bagged 51 Huns

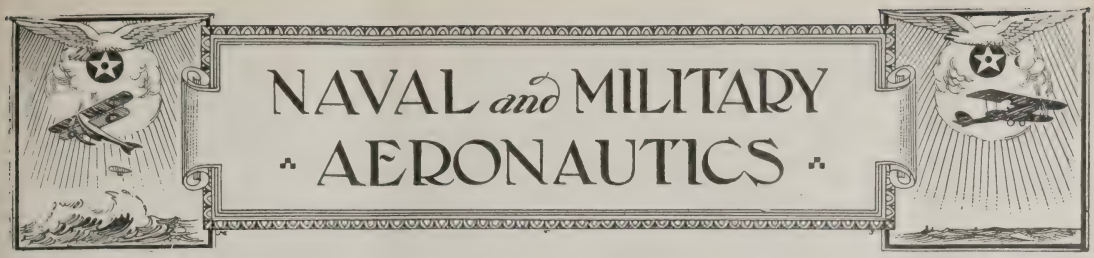
London.—Announcement that Major Raymond Collishaw, now attached to the naval air service, had just been awarded the bar to the Distinguished Service Order brings out the statement that this brilliant flier has destroyed fifty-one enemy machines.

British Award D. S. O. to American Flier

Washington.—General Pershing informed the War Department on September 23 that Lieut. A. F. Bonnalie of 2,521 Mission Street, San Francisco, an American attached to the Royal Air Force, had received the British Distinguished Service Order for heroism in an air fight August 13, in which he saved another machine from destruction, and later, by great ingenuity, brought his own riddled plane safely within the British lines.

"This officer," said General Pershing's report, "led two other machines on a long photographic reconnoissance. In spite of the presence of numerous enemy aircraft, they were able to take all photographs required, but were attacked by six Fokker biplanes.

"During the combat Lieut. Bonnalie saw that one of his accompanying machines was in difficulty and that an enemy aeroplane was nearly on its tail. He at once broke off combat with the enemy with whom he was engaged and dived to the assistance of the machine in trouble. He drove off the enemy plane, regardless of the bullets which were ripping up his own machine.



"Eventually, however, his tail planes and his elevator wires were shot away and his machine began to fall in side slips. Lieut. Bonnalie managed to keep his machine facing toward the British lines by means of the rudder control, while his observers and third machine drove off the enemy aircraft which was still attacking.

"In its damaged condition Lieut. Bonnalie's machine was tail-heavy, and he therefore had his observer leave his cockpit and lie out along the cowl in front of the pilot. In this manner he recrossed the British trenches at a low altitude and righted his machine sufficiently to avoid a fatal crash.

"Had it not been for the gallantry of Lieut. Bonnalie, the injured machine to whose assistance he went would have fallen into enemy territory, as its pilot had been wounded and its observer killed. Lieut. Bonnalie's own machine was riddled with bullets, and it was a marvelous performance to bring it safely to the ground."

Godman Field Named

According to an announcement made by Major General Wm. L. Kenly the Aviation Field at the Artillery Brigade Firing Center, located at Camp Knox, Stithton, Kentucky, has been named Godman Field. The field is named in honor of First Lieutenant Louis K. Godman, an Army Corps pilot of the Air Service, who was killed in an aeroplane accident at Camp Jackson, Columbia, South Carolina, September 28, 1918.

Key to Abbreviations

AAD—Assigned to active duty.
ABC—Report to Army Balloon School, Arcadia, Cal.
ABC—Report to Army Balloon School, Arcadia, Cal.
ADO—Report to Aviation Supply Depot, Dayton, Ohio.
ADT—Report to Aviation Supply Depot, Dallas, Texas.
AFO—Report to Aviation Supply Depot, Fairfield, O.
AGC—Report to Aviation Supply Depot, Garden City, L. I., N. Y.
AHT—Report to Aerial Gunnery School, Houston, Texas.
AIR—Transferred to the Air Service, National Army, without change in rank or date of commission.
ALF—Report to Camp Alfred Vail, Little Silver, N. J.
AMV—Report to Aviation General Supply Depot, Morrison, Va.
AOV—Report to School for Aerial Observers, Hampton, Va.
APR—Report to School of Aerial Photography, Rochester, N. Y.
ARV—Report to Aviation Supply Depot, Richmond, Va
ASM—Report to Aviation Mechanics' Training School, St. Paul, Minn.
BFT—Report to Barron Field, Fort Worth, Texas.
BRN—Report to Bakers Field, Rochester, N. Y.
BST—Report to Brooks Field, San Antonio, Tex.
CAF—Report to Carlstrom Field, Arcadia, Fla.
CAP—Commissioned as Captain, Aviation Section, Signal Corps.
CDT—Report to Aviation Concentration Camp, Dallas, Texas.
CFT—Report to Carruthers Field, Fort Worth, Texas.
CGC—Report to Aviation Concentration Camp, Garden City, L. I., N. Y.
CGS—Report to Aviation Concentration Camp, Greenville, S. C.
CIT—Report to Radio School, Carnegie Institute of Technology, Pittsburgh, Pa.
CJS—Report to Camp Jackson, Columbia, S. C.
CJW—Report to Camp John Wise, San Antonio, Texas.
CLR—Commissioned as Colonel, Aviation Section, Signal Reserve Corps.
CMV—Report to Aviation Concentration Camp, Morrison, Va.
CPA—Commissioned as Captain Air Service, National Army.
CPR—Commissioned as Captain, Aviation Section, Signal Reserve Corps.
CRI—Report to Chanute Field, Rantoul, Ill.
CSO—Report to the Chief Signal Officer, Washington, D. C.
CUI—Report to School of Military Aeronautics, Cornell University, Ithaca, N. Y.
CWT—Report to Call Field, Wichita Falls, Texas
DAF—Report to Dorr Field, Arcadia, Fla.
DAP—Report to Director of Aircraft Production, Washington, D. C.
DIK—Report to Camp Dick, Dallas, Tex.
DIS—Honorably discharged from service.
DMA—Report to Director of MilitaryAeronautics, Washington, D. C.
ELA—Report to Eberts Field, Loanoke, Ark.
EOT—Report to Ellington Field, Olcott, Texas.
FLA—Commissioned as First Lieutenant Air Service, National Army.
FLR—Commissioned as First Lieutenant, Aviation Section, Signal Reserve Corps.
FLT—Commissioned as First Lieutenant, Aviation Section, Signal Corps.
FOB—Report to Fort Omaha Balloon School, Omaha, Neb.
FRF—On duty requiring regular and frequent aerial flights.
FSO—Report to Fort Sill School for Aerial Observers, Fort Sill, Okla.
GIT—Report to School of Military Aeronautics, Georgia Institute of Technology, Augusta, Ga.
GLC—Report to Gerstner Field, Lake Charles, La.
HHN—Report to Hazelhurst Field, Mineola, L. I., N. Y.
IMA—Rated as Junior Military Aviator.
JRC—Report to Jackson Field, Riverside, Cal.
KST—Report to Kelly Field, So. San Antonio, Tex. (When specified in the order, the number of the field is given in parentheses)
LDT—Report to Love Field, Dallas, Tex.
LHV—Report to Langley Field, Hampton, Va
MAC—Report to March Field, Allesandro, Cal
MAJ—Commissioned as Major, Aviation Section, Signal Corps.
MAT—Report to Mather Field, Sacramento, Cal.
MDO—Report to McCook Field, Dayton, Ohio
MIA—Report to U. S. Naval Air Station, Miami, Fla.
MIT—Report to School of Military Aeronautics, Massachusetts Institute of Technology, Boston, Mass.
MJA—Commissioned as Major Air Service, National Army.
MJR—Commissioned as Major, Aviation Section, Signal Reserve Corps.
MSC—Report to Radio School, Maryland State Agricultural College, College Park, Md
OBS—Attached to the Aeronautical Service as Observers.
OSU—Report to School of Military Aeronautics, Ohio State University, Columbus, Ohio.
PFO—Report to Post Field, Fort Sill, Okla.
PMT—Report to Park Field, Millington, Tenn
PUP—Report to School of Military Aeronautics, Princeton University, Princeton, N. J.
PWM—Report to Payne Field, West Point, Miss.
REL—Relieved from present duty.
RSD—Report to Rockwell Field, San Diego Cal.
RTR—Retransferred to organization attached to previous assignment to aviation duty.
RWT—Report to Rich Field, Waco, Tex.
SBI—Report to Scott Field, Belleville, Ill
SAG—Report to Souther Field, Americus, Ga.
SGS—Report to Camp Sevier, Greenville, S. C
SLA—Commissioned as Second Lieutenant Air Service, National Army.
SLR—Commissioned as Second Lieutenant, Aviation Section, Signal Reserve Corps.
SLT—Commissioned as Second Lieutenant, Aviation Section, Signal Corps.
SMA—Report to School of Military Aeronautics, Cambridge, Mass.
SMM—Report to Selfridge Field, Mount Clemens, Mich.
SRC—Report to Columbia School for Radio Officers, New York City.
TFT—Report to Taliaferro Field, Fort Worth, Texas. (When specified in the order, the number of the field is given in parentheses)
TMA—Report to Taylor Field, Montgomery, Ala.
UCB—Report to School of Military Aeronautics, University of California, Berkeley, Cal.
UIU—Report to School of Military Aeronautics, University of Illinois, Urbana, Ill
UTA—Report to School of Military Aeronautics, University of Texas, Austin, Tex
VBW—Report to Vancouver Barracks, Washington.
WAC—Report to Aviation Concentration Camp Waco, Tex.
WCS—Wire to the Chief Signal Officer upon arrival.
WDM—Wire, Director of Military Aeronautics, upon arrival
WFO—Report to Wilbur Wright Field, Fairfield, Ohio

Notes

Note 1—Report to places mentioned in order named for temporary duty.

Note 2—Report to Aviation Repair depot, Indianapolis, Ind. Speedway.

Note 3—Report to District accounts office, Detroit, Mich.

Note 4—Report to Camp Knox, West Point, Ky.

Note 5—Report to Jacksonville, Fla., Wire DAP.

Note 6—Report to Aviation Gen. Supply depot, Little Rock, Ark.

Note 7—Report to Atlanta, Ga., Wire Chief of Staff.

Note 8—Report to Spruce Production Div., Portland, Ore.

Note 9—Report to Army Balloon school, Arcadia, Cal.

Note 10—Report to School for Radio Mechanics, Pittsburgh, Pa.

Note 11—Report to Dis. Mgr., Aircraft Production, Detroit, Mich. Wire DAP.

Note 12—Report to Newport News, Va., for duty at Camp Hill.

Major Cushman A. Rice, the well known U. S. Army Air Service officer, who took a large aero unit to England and then to France and participated in the second Marne battle, and was wounded and gassed. The entire unit which Major Rice commanded was cited and distinguished itself in many ways. Major Rice has returned to the United States and although the doctors have given some discouraging reports, it is expected that, thanks to his remarkable constitution, he will fully recuperate. On the left hand side is First Lieutenant Don Hickey

FOREIGN NEWS

BRITISH

In the war in the air last week sixteen enemy machines were destroyed and five driven down out of control. Nineteen British aeroplanes were reported missing. The low toll of machines destroyed was due in part to the prevalence of fog and rain in northern France and Flanders, and in part to the inactivity of the enemy. In addition to other valuable aid to the advancing troops the British airmen dropped heavy cargoes of bombs upon the enemy barge traffic between Bruges and Ghent, and hostile aircraft lined up in the German aerodromes at St. Denis Westrem.

At Somergem a train full of German troops was set on fire, while the horse and motor traffic on the congested roads converging on Ghent was continuously harassed. In the course of a recent raid on the railway junction at Aulnoy, an ammunition train was hit and set on fire. Prisoners add that the whole train blew up in close proximity to a troop train which had just entered the station. The junction was wrecked and 900 casualties are said to have been caused.

At Valenciennes two ammunition trains were hit by British airmen. They burned and exploded furiously for two hours, and all work in that area had to be suspended owing to the shells exploding in different directions. Other prisoners report that in the raid made by a British squadron upon a German aerodrome on the Valenciennes-Frameries road more than thirty aeroplanes were destroyed. One result of a reconnaissance carried out by the royal air force during the week was the indication of a number of new enemy aerodromes, the bulk of them being in the area between Mons and Maubeuge.

Despite the prevalence of thick mists in the south, the Independent Air Force, in the course of the week, made sixteen raids into German territory.

The official statement on the operations of the Independent Air Force, issued October 30th, says: "Tuesday night we attacked the aeroplane works at Mannheim, the furnaces at Burbach, the railways at Thionville and Offenburg, and the aerodrome at Hagenau."

For four months London has enjoyed immunity from hostile air raids and moonlight nights are no longer dreaded by its inhabitants. For many weeks German airmen have had far more urgent business to attend to on the other side of the channel. Much of this is due to the persistent raiding of Rhine towns and the bombing of German aerodromes. These attacks compel the enemy to muster for defense machines which they can very ill spare from the battlefields where allied supremacy in the air becomes increasingly manifest.

The frequent raids on German towns have been fully recorded, but the growing frequency of attacks on German aerodromes have received much less attention. From information obtained from the War Ministry it is learned that in the month of August alone there were thirty-three attacks on German aerodromes, nineteen of which were directed against two of them which had become particularly obnoxious as hives of aerial wasps.

In one daylight raid on an aerodrome a fierce combat lasted over forty minutes as a result of which four German machines were destroyed and three others driven down "out of control." Two British machines were lost. Many of the night raids have been very effective.

The result of these attacks is to cripple the German's aggressive work and their power of retaliation and demoralize their personnel. Their recuperative powers are now at a low ebb.

Fourteen enemy aeroplanes and three enemy balloons were brought down by American aviators with the British forces in the period from August 25th to September 8th, according to a summary of British Royal Air Force communiques.

The Distinguished Service Order was given to First Lieut. A. F. Sonnalie, and special mention was made of the following combat in which American aviators participated:

"First Lieut. H. R. Clay brought down an enemy aeroplane which was attacking an S. E. 5, and then attacked another which was fighting one of his own patrol and brought it down. He was then set on by three enemy aeroplanes and after fighting for three minutes First Lieut. C. Bissell, of the same squadron, came to his assistance and shot down two of the hostile machines and drove another down out of control."

Other Americans mentioned as bringing down enemy aeroplanes were: First Lieutenants, A. S. S. S.—F. A. Dixon, 5538 Forbes Street, Pittsburgh, Pa.; T. D. Moore, 617 Chestnut Street, Kewanee, Ill.; E. W. Springs, Lancaster, Pa.; E. H. Barksdale, Goshen Springs, Miss.; F. E. Kindley, Gravotts, Ark.; C. I. McLean, 776 Madison Avenue, New York City, N. Y.; W. B. Knox, No. 1 West Brown Hall, Princeton University, Princeton, N. J.; F. E. Luff, 3046 Lincoln Boulevard, Cleveland Heights, Ohio; H. L. Blair, 111 West One hundred and eleventh Street, New York City, N. Y.; J. O. Crooch, 6614 Harlan Place, Takoma Park, D. C.

Enemy balloons were brought down by Second Lieutenants I. P. Corse, 2301 First Avenue South, Minneapolis, Minn.; F. E. Luff, 3046 Lincoln Boulevard, Cleveland Heights, Ohio.

In the recent sensational British victories in Palestine British airmen played a great part, and from some of those heroes who faced perils above the deserts beyond the Jordan and in other wild and savage regions, have been obtained particulars that read like wild romances of a kind of fighting far removed from anything which our boys who patrol the skies above the western front have had to face.

One of the men who lately flew under General Allenby across the Egyptian deserts served an apprenticeship in East Africa, where, when compelled to come down by engine trouble, he was promptly attacked by a herd of wild elephants, who resented the arrival of this great new bird in the regions over which they held domain. The pilot slipped away and hid, while the elephants ripped up the machine with their trunks until a comrade aeroplane charged down from the sky, put the tusked monsters to flight and rescued the shivering birdman.

On many occasions aviators in Africa have had to use their machine-guns and automatic pistols against wild beasts, while it is known that some have perished, killed either by denizens of the jungle or hostile tribesmen, or dying of thirst in arid wastes, where their sole chance of life lay in finding a water-hole.

Not long ago an aeroplane set out on a desert reconnaissance for General Allenby's army and failed to return. A rescuing aeroplane went and found evidence of a tragedy. A forced landing had occurred 100 miles within hostile territory, followed by an attack from a band of wandering Bedouins, whom the pilot of the second aeroplane saw on the horizon scurring away as he swooped down.

He hastily descended and ran to the wrecked machine. All the woodwork and wing fabric had been hacked to pieces. An effort had even been made to destroy the engine, but the machine gun had not been carried off, possibly because it had jammed and was therefore regarded as useless. A half-expended drum of cartridges was still in position, and the many cases lying about showed that the pilot and observer had put up a good fight.

Footprints led away from the wreckage. The heavy stumbling footprints of wounded men closely pressed could be distinguished from the more extended lighter footprints of their pursuers. The tracks ended at the base of one of those huge gray boulders with with the desert is studded. Here the pursued had turned at bay.

It will never be known what that last stand cost the savage victors, for the Bedouins always carry off their dead and wounded. But empty automatic clips, and the empty magazine of each revolver, told that these two English boys had exacted a heavy price for their lives. Their bodies lay at the base of the rock, hacked to pieces by the infuriated victors.

German and Turkish emissaries, since the beginning of the war, have incited the wild inhabitants of the desert into attacking disabled machines, which the wild Arabs regard as inventions of the devil driven by demons. The fate of the airman who falls into the hands of wandering tribesmen who have come under Turkish or German influence is a horrible one.

Most sensational results have been achieved by Allenby's flyers, and their work contributed greatly to the crushing victory of September between the Jordan and the sea, but in Mesopotamia and East Africa as well much good work has been done by lads from the green fields of England, who have voluntarily gone forth to face discomforts of which France and Belgium know nothing—heat, sand, mosquitoes, horrible scorpions, wild beasts and wilder men, with the prospect of death by thirst or torture, if mishap occurs. But the work goes on. There are several hundred British aviators ceaselessly patrolling the great wastes of territory in which the minor campaigns of the war are waged.

Early on the morning of October 17th a British airman, flying low over Ostend, perceived civilians wildly signalling him to descend. As he circled in doubt the signals were repeated, and, as there was no sign of Germans anywhere, the pilot made a daring landing in the main street of the city, to be greeted with the information that the enemy had decamped in the night.

FRENCH

The official communication on aerial operation issued November 5 says:

"During the day of November 4 bombing machines dropped more than thirty-eight tons of projectiles and fired 16,000 cartridges on convoys and troop concentrations in the region of Vendresse and Daucourt; 10,250 kilos of projectiles were dropped on the railway stations at Mezieres, Mohon, Lumes, Triage, Sedan, Poix-Terron and Vendresse."

Our troops continued without cessation their pursuit of the enemy during the day of November 7.

Our aeroplanes, working in liaison with our infantry, attacked, bombed and machine gunned enemy columns in retreat, utilizing 15,500 kilos of bombs and 13,000 cartridges.

ITALIAN

On October 17 our aeroplanes made reconnoitering raids on the Friulan and Venetian plains. An enemy balloon was downed over Oderzo. The weather was still very bad. It was raining in the lower valleys and in the plains, and snowing in the mountain zone.

On October 18, notwithstanding the continuous bad weather, our aeroplanes were partially active on the front. Troops being transported were gunned with effective results.

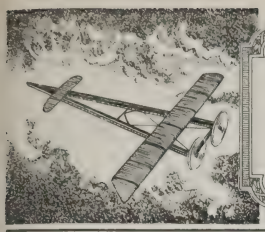
On October 18 and 19 little aerial activity on account of the very bad weather. On the nineteenth our planes were active on the Piave making reconnoitering raids.

On October 21 very little aerial activity on account of the weather. On October 22 our aeroplanes bombed enemy centers of communication and brought down three enemy machines.

On October 23 our aeroplanes bombed military objectives in the region of Fonzaso and Sacile. The weather was still bad along the whole front.

On October 24 Italian bombing squadrons dropped bombs over the enemy camps in the region of Fonzaso and over the large enemy depots in the neighborhood of the station of Sacile.

On October 25 our airships, bombing and pursuit planes were very active on the Brenta, Cismon, Feltre and Fonzaso regions, helping to carry on our big drive against the Austrians. More than ten tons of explosives have been dropped on military centers. Three enemy machines were brought down.



On October 26 squadrons of our aeroplanes operating in following rings, bombed very severely and with splendid results, enemy camps and depots, bombed and destroyed columns of marching troops and dropped altogether more than two tons of bombs on Val Sugana, Val di Cismon, and on the Conca di Arten. Two tons of bombs were dropped during the night by airships over the railway junction. Two enemy machines were brought down by our aviators. In Albania numerous reconnoitering raids were carried on by our aeroplane squadrons.

On October 27, during our big drive across the Piava, the aerial machines participated continuously with extreme daring to the fight. More than fifteen tons of high explosives were dropped on the enemy lines. Enemy troops were gunned from a very low altitude by our machines. Eleven aeroplanes and three balloons were dropped down in the aerial battle. Col. Piccio got his twenty-fourth victory.

In the last week the aviation of the Italian navy made frequent reconnoitering raids along the Albanian coasts and rear stations of the enemy, going farther than Antivari. On October 22 the Italian hydro-aeroplane squadrons bombed the big Lagosta hangar. On the twenty-third, forty-three bombing machines, of which thirteen were Americans, dropped more than three tons of explosives over Pola with very efficient results, destroying many of the big Austrian hangars. Notwithstanding the anti-aircraft, Austrian guns and useless enemy's machines, all our machines came back safely.

Italian Flying Chief Injured on Piave

Milan—Commander Mouzo, chief of staff of the 150th Italian Aerial Division, and one of the best known aviators in Italy's army, was severely wounded in the fighting along the Piave.

Model Aeroplane Building as a Step to Aeronautic Engineering

THE travel of the center of pressure must be known for all wings sections, and when a designer has a wing under consideration he must know the location of the center of pressure at each different angle of the wing chord when the machine is in flight, and the reasons follow:

We know that an aeroplane is so designed that the center of pressure of the wings must be on a vertical line with the center of gravity of the machine, for the U. S. A. No. 1, at angle of zero this occurs at .530 of the wing chord from the leading edge of the wing, now for a wing with a chord of 48 inches, we locate the C. P. by multiplying 48 by .530 and we get 25.44 inches, which is the distance from the leading edge, to locate the center of pressure. This is for zero angle and the designer would place his wings on the machine so that the leading edge of the wing would be set 25.44 inches ahead of the center of gravity of the machine. But the reader will remember that this is for zero angle only, or for the angle that the designer would set his wings on a fast machine. Now by again referring to the table you will notice that the center of pressure travels forward as the angle increases, and as the pilot must alter the angle of the wings many times in flight, there are times when the C. P. would be in front of the center of gravity, which would be detrimental to the proper working of the machine, as the reader will see that should the C. P. come ahead of the C. G. it would cause the tail of the machine to fall and when climbing the aeroplane would be in danger of stalling. For this reason the designer must figure the C. P. at all angles of the wing and select a point about midway between these two points, for instance, we found the C. P. 25.44 inches from the leading edge at zero angle, and referring to the table we find .274 at 14 degrees figuring it out we get 13.15 inches. This shows a difference 25.44 and 13.15 of 12.29 inches dividing this amount in half we get 6.145 subtracting this from 25.44 we have 19.295 inches, which would be the correct and final location of the C. P.

Resistance of bodies, struts, wires, etc.

Having found out the method of figuring the resistance of wings, we will now turn to the resistance of non-lifting parts as body, struts, wires, wheels, tail, rudder, etc. This resistance is known as parasite resistance and should be figured separate from the wings for checking up, but later we can add the wing and parasite resistance together to figure the performance of the machine.

To figure the resistance of bodies, different methods are employed, some take the maximum cross section of a body and find the resistance of this as if it were a flat plate, then multiplying by a coefficient which is determined by the ratio of the cross section to the length, if the body has a radiator set in the nose of the machine we figure the resistance on the radiator (which is determined from a table given for the resistance of radiators) and the skin friction of the whole surface of the body. Taking it all in all, the only correct method would be to test the model in a wind tunnel, but figures will come close enough for what we wish to know.

For a body where the radiator is set in the nose of the machine, we can figure the resistance on the radiator, then add the skin friction to this and find the total resistance, for instance the coefficient of radiator resistance is .00173, so for a radiator with a frontal area of 4 sq. ft. at 60 M. P. H. we simply multiply .00173 X 4 sq. ft. and this product by the square of 60 or 3,600, which gives us 24.91 lbs. at 60 M. P. H. Now the skin friction must be figured. We find the total surface area of the body or as near to it as possible and multiply it by the coefficient of skin friction which is .03 at 60 M. P. H. Supposing the total surface area of the body to be 300 sq. ft. then the skin resistance would be 300 X .03 or 9 lb. at 60 M. P. H. This added to the radiator resistance gives us 33.91 or roughly 34 lbs., at 60 M. P. H. Now as the body is in line with the propeller, a back wash is constantly working on the body, and as the slippage of the propeller is figured at 25 per cent we can increase the resistance of the body 25 per cent or instead of figuring the square of 60 or 3,600 we add 25 per cent to 3,600 and get 4,500, so we must multiply by 4,500 instead of 3,600.

The opening for the pilot's cockpit causes a disturbance of the air around this section and this also tends to hold the machine back but at a speed of 60 M. P. H. we can neglect it, as it becomes noticeable only at high speeds.

(To be continued)

Small single-seater biplane, powered with an Excelsior motorcycle engine of 15 H.P. The weight of the complete outfit is 225 lbs., measures 15 feet overall and has a spread of 26 feet. This little machine was built at the Chicago Aero Works for Mr. Raymond Carroll, of Oak Park, Illinois

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

No Need for the Color Line

Down South, where the colored population have separate street cars for the whites to ride in, Sam Johnson, a colored porter, got his first glimpse of an aeroplane. The pilot was stunting over the main street of the town and Sam, among others, was watching the performance. He gazed intently for a few minutes, and then with a shake of his head he remarked to the proprietor of the local hotel, "I wanna tell you, Boss, it's going to be a long, long time before there's going to be any great call for Jim Crow cars in that line."

There was a young girl of La Bassee
Whose features were just a bit passee
Her brain-pan, no doubt,
Had something left out,
But, oh, what a wonderful chassis.

New ground officer, just out (to flight sergeant, who is loafing round the canteen): "What are you doing here?"

Flight (who sizes up his man correctly): "Swinging the lead, sir."

N. G. O., J. O. (stumped): "Right-ho, Carry on."

Poor Old Gunga Din

(With apologies to Rudyard Kipling)

You may talk of "vin" and "biere"
When you're quartered "over there"
In New York or Abeline or Sleepy Hollow,
But when belts are growing tighter
It's that soda water blighter
That you'd give a dollar ninety-nine to swallow.
In the well-known U. S. A.
Where we used to work and play,
Attending to our pleasures and our "biz,"
Of all the liquid crew,
The finest drink they grew
Was their brimming glass of ice cream soda fizz.
It was fizz, fizz, fizz
Was the brimming glass of ice cream soda fizz.
Gimme strawberry, vanilla
Coffee, peach or *sarsperilla*
Gimme any kind of ice cream soda fizz

Bunch of cloth

The Curtis Dreadnaught Propeller Cutting Machine, Model 55

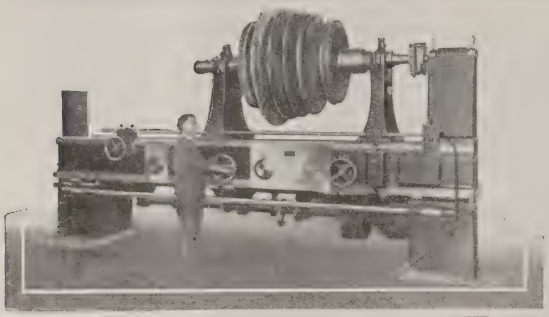
THIS machine cuts four blades at a time, and cuts closer and more accurate than any other machine in the market.

It finishes the hub the same as all other parts of the blade.

It cuts with the grain of the wood.

It does not require a metal model; just a regular stock blade is sufficient.

It does not bump over the pattern.



It is manually operated, which gives it the advantage of the human touch required on accurate work.

The hand work required after this machine is from 3½ to 4½ hours on each blade.

It leaves just enough wood for cleaning up.

Curtis Machine Corp.

Jamestown, N. Y.

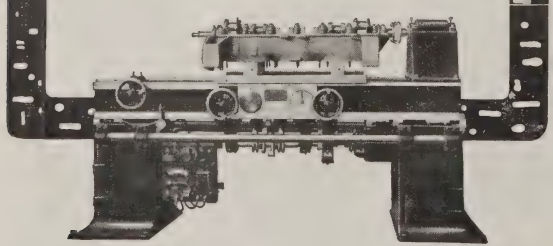
BALANCING G. E. TURBINE ROTORS

The difficulty of securing and the necessity of having true running balance in turbine rotors has long been a source of worry to mechanics and engineers.

In the past, hours of time and much higher mathematics were required by the cut-and-try method and even then *exact* results could only be approximated.

This illustration shows how the G. E. Company have solved this important and perplexing problem at the Schenectady works. They now use a

CARWEN
Dynamic Balancing Machine
(Sensitive Pattern)



which quickly determines the exact amount of metal to be removed from or added to the rotor to put it in accurate running—not mere static—balance.

Similar results are being obtained by manufacturers of airplane, automobile, truck and other gas engine crankshafts, electric motor armatures or in fact on any machine having rapidly rotating parts that require exactness of running balance.

The cost of purchasing and operating a Carwen is negligible as compared with the gain in output and increased efficiency of your product. Made in sizes for balancing objects weighing from 5 oz. to 15,000 lbs.

Write for booklet that illustrates and describes the principle and operation.

More Airmen Win D. S. C.

Washington.—The Commander in Chief, in the name of the President, has awarded the Distinguished Service Cross to the following named officers for the acts of extraordinary heroism described after their names:

Major Carl Spatz, Pilot, Air Service—For extraordinary heroism in action during the St. Mihiel offensive, September 26, 1918. Major Spatz, although he had received orders to go to the United States begged for and received permission to serve with a pursuit squadron at the front. Subordinating himself to men of lower rank, he was attached to a squadron as a pilot and saw conditions and arduous service through the offensive. As he result of his efficient work he was promoted to the position of Flight Commander. Knowing that another attack was to take place in the vicinity of Verdun he remained on duty in order to take part. On the day of the attack west of the Meuse, while with his patrol over enemy lines, a number of enemy aircraft were encountered. In the combat that followed he succeeded in bringing down two enemy planes. In his ardor and enthusiasm he became separated from his patrol while following another enemy far beyond the lines. His gas giving out, he was forced to land, and managed to land within friendly territory. Through these acts he became an inspiration and example to all men with whom he was associated.

First Lieut. Karl G. Payne, Air Service, 20th Aero Squadron—For extraordinary heroism in action near Longuyon, France, September 16, 1918. Starting on a very important daylight bombing mission with five other planes, Lieut. Payne, observer, went on alone when the other five planes were forced to turn back. On crossing the German lines he was attacked by three enemy planes. Using his guns to keep the enemy at bay, he went on, reached his objective and dropped his bombs on the railroad junction, cutting the line. On the way back four more planes joined in the attack, but keeping them at bay with his guns he reached the Allied lines.

First Lieut. Hugh L. Fontaine, 49th Aero Squadron—For extraordinary heroism in action in the region of Hagerville, on September 14. Lieut. Fontaine, together with First Lieut. Hugh Brewster, attacked nine enemy monoplanes, Fokkers, at an altitude of 4,000 meters. He dived into the midst of the enemy formation without consideration for his personal safety, subjecting himself to great danger. By the suddenness and extreme vehemence of his attack, the machines were driven into confusion. Although greatly outnumbered, he and Lieut. Brewster succeeded in shooting down two of the enemy.

First Lieut. Hugh Brewster, 49th Aero Squadron—For extraordinary heroism in action in the region of Hagersville, on September 14. Lieut. Brewster, together with First Lieut. Hugh L. Fontaine, attacked nine enemy planes, Fokkers, at an altitude of 4,000 meters. He dived into the midst of the enemy formation without consideration for his personal safety, subjecting himself to great danger. By the suddenness and extreme vehemence of his attack the machines were driven into confusion. Although greatly outnumbered, he and Lieut. Fontaine succeeded in shooting down two of the enemy.

First Lieut. Clarence C. Kahle, pilot, 99th Aero Squadron—For extraordinary heroism in action near La Chausse, on September 13. Lieut. Kahle and First Lieut. Raymond C. Hill, observer, were directed to take photographs of the old Hindenburg line. They were accompanied by two protecting planes. After they had taken some photographs, the protecting planes were driven off by hostile aircraft, but Lieut. Kahle and his observer continued their mission alone, until, in the vicinity of La Chausse, they were attacked by an enemy formation of nine planes, Lieutenant Kahle put up a gallant fight, in which his observer was shot through the heart and killed. Although pitted against overwhelming odds, Lieut. Kahle, by his pluck, determination, skill and courage, brought the photographs and the plane back to his aerodrome, the enemy keeping up a constant attack upon him back to our lines, riddling the plane with machine-gun bullets.

First Lieut. Raymond C. Hill, deceased, observer, 99th Aero Squadron—For extraordinary heroism in action near La Chausse, on September 13. Lieut. Hill, with First Lieut. Clarence C. Kahle, pilot, was directed to take photographs of the old Hindenburg line. They were accompanied by two protecting planes. After they had taken some photographs the protecting planes were driven off by hostile aircraft, but Lieut. Hill and his pilot continued on their mission alone, until, in the vicinity of La Chausse, they were attacked by an enemy formation of nine planes. Putting up a gallant fight against these overwhelming odds, Lieutenant Hill was shot through the heart and killed; but his pilot, by his pluck, determination, skill, and courage, brought home the photographs and the plane to our lines.

Second Lieut. Paul J. O'Donnell, deceased, Infantry, 96th Aero Squadron—For extraordinary heroism in action near Dunsermeuse, on September 26. His formation was attacked, while flying to bomb Dunsurmeuse, by seven enemy planes. With the first spurt of enemy fire, Lieut. O'Donnell was fatally wounded. With his last strength he opened a deliberate and destructive fire on one of the enemy planes, driving it down out of control.

Second Lieut. Howard G. Rath, observer, 96th Aero Squadron—For extraordinary heroism in action between Rhambley and Xannes, September 13. Lieut. Rath, while acting as leading observer of a flight of three planes, was attacked by fifteen enemy planes. In spite of the fact that his formation was surrounded by an enemy five times as large, he carried out successfully his mission and bombed his objective. In the return running fight, Lieut. Rath and his pilot continued the unequal fight and succeeded in returning to their aerodrome with valuable information.

First Lieut. Cecil G. Sellers, Air Service, 20th Aero Squadron—For extraordinary heroism in action near Longuyon, France, September 16, 1918. Starting on a very important bombing mission with five other planes, Lieut. Sellers, pilot, went on alone when the other five machines were forced to turn back. On crossing the enemy lines he was attacked by three enemy planes, but continued toward his objectives while his observer kept them at bay. In the face of this hostile opposition the objective was reached and their bombs dropped. On the way back four more planes joined in the attack, but fighting them off they reached our lines with valuable information, after a fight lasting thirty-eight minutes.

Fird Lieut. Bradley J. Gaylord, pilot, first day bombardment groups Air Service—for extraordinary heroism in action between Chambley and Xannes, France, September 13, 1918. Lieut. Gaylord, while leading an important mission with two other planes, was attacked by fifteen enemy planes. Nevertheless he and his observer carried out the mission, bombed the objective in a running fight and shot down at least one enemy plane.

First Lieut. Charles R. Dolive, pilot, Air Service, 93rd Aero Squadron—For extraordinary heroism in action near St. Benoit, France, September 12, 1918. Lieut. Dolive, in conjunction with another American pilot, engaged and fought five enemy planes. Outnumbered and fighting against tremendous odds, Lieut. Dolive shot down three enemy planes and outfought the entire enemy formation.

First Lieut. J. Dickinson Este, 13th Aero Squadron, Air Service—For extraordinary heroism in action near Chambley, France, September 13, 1918. Lieut. Este was leading an offensive patrol of five machines when a formation of seven enemy single seaters approached the patrol from above. Although outnumbered and in a very disadvantageous position he did not hesitate to lead his patrol to the attack. Through the

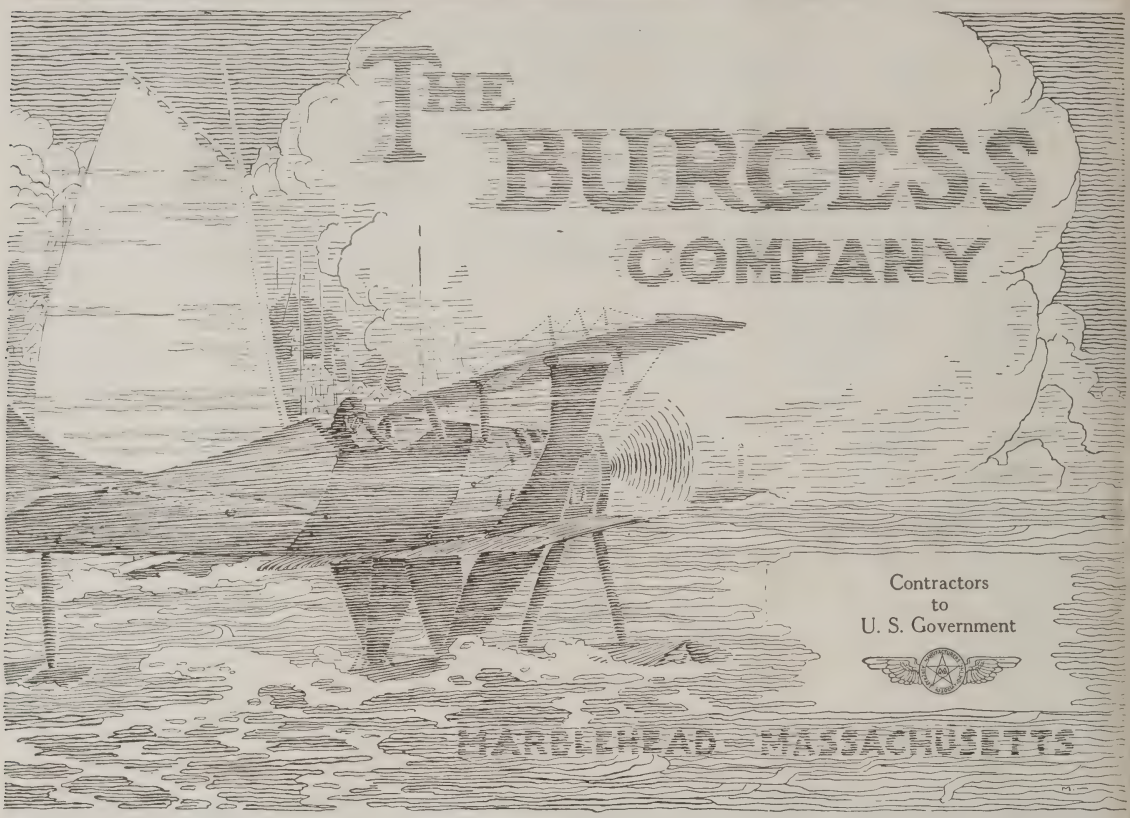
WE USE THE CELEBRATED

LUMA RADIUM

Radium Luminous Compound

Luma-lited Dials are Always Visible

Manufacturers of aeronautic instruments can save much expense, inconvenience and uncertainty by sending us their dials to be illumined.



We use Luma exclusively. Its superior luminosity, long life and dependability have long been recognized. Guaranteed to contain only Radium as its activating agent. Approved by Great Britain and the United States Government for use in military air service.

Our work is of the highest character and assures results of unvarying excellence.

Estimates and full information upon request.

combat which followed Lieut. Este fought with the greatest bravery, in spite of the fact that he was himself attacked by two enemy planes, which fired at him at pointblank range from the rear and above. By his skill and courage he was able to keep his formation together, and they succeeded in shooting down three of the enemy planes, of which Lieut. Este himself destroyed one and drove down another out of control.

Lieut. Wilbert W. White, Air Service—While protecting three observation planes, Lieut. White was attacked by three Halberstadt fighters. He led them away from the observation planes, which were permitted to carry on their work unmolested.

Returning home he dived through a cloud to attack an enemy balloon, bringing it down in flames.

Two Fokker scouts attacked him. He attacked the first head on, shooting until it went down into a vertical dive out of control. Pulling up sharply, he fired a long burst at the second as it went over him, putting it to immediate flight.

Lieut. William Clarkson Potter, also decorated, was with a daylight bombing mission on Dunsur-Meuse which was attacked by a force of enemy planes three times its number. He saw that the observer's guns on the leading machine were inactive. He flew in close to the leader, so as to protect him from the rear. This position he held under ever increasing enemy attack, and in face of the fact that his leader continued on into Germany.

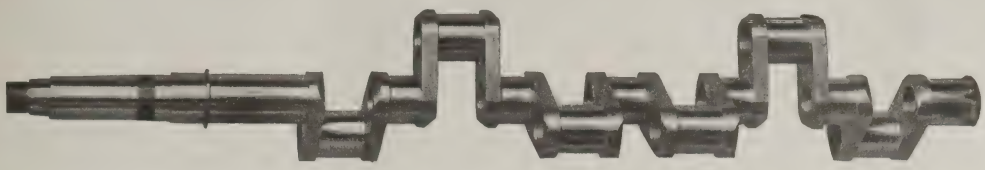
The conditions became more desperate, still Lieut. Potter hung on until his leader was finally able to make a turn about to the Allied lines. On landing it was found that the observer had been killed and had fallen and jammed the controls, making a turn impossible.

Second Lieut. Arthur R. Brooks, Air Service—For extraordinary heroism in action over Marsla-Tour on September 14. Lieut. Brooks, when his patrol was attacked by twelve enemy Fokkers over Mars-la-Tour, eight miles within the enemy lines, alone fought bravely and relentlessly with eight of them, pursuing the fight from 5,000 meters to within a few meters of the ground, and though his right rudder control was out and his plane riddled with bullets, he destroyed two Fokkers, one falling out of control and the other bursting into flames.

First Lieut. Edward V. Rickenbacker, Air Service, 94th Aero Squadron—For the following act of extraordinary heroism. The Bronze Oak Leaf is awarded to be worn on the Distinguished Service Cross awarded October 16. On September 14, in the region of Villecy, he attacked four Fokker enemy planes at an altitude of 3,000 meters. After a sharp and hot action, he succeeded in shooting one down in flames and dispersing the other three. For the following act of extraordinary heroism a Bronze Oak Leaf is awarded to be worn on the Distinguished Service Cross awarded October 16. On September 15, 1918, in the region of Bois de Waville, he encountered six enemy planes, which were in the act of attacking four Spads, which were below them. Undeterred by their superior numbers, he unhesitatingly attacked them and succeeded in shooting one down in flames and completely breaking the formation of the others.

Aviators Break Flight Records

October has witnessed the smashing of all American aviation precedents. A 4,000-mile flight from the Gulf of Mexico to the Great Lakes and return was made by an army officer from Ellington Field, Houston, Tex. Three other Ellington Field aviators made the first successful flight from Texas to Washington, landing in this city last week. Three seaplanes, following the Atlantic coastline, have completed a wonderful flight from Philadelphia to Pensacola, Fla.



The 4,000-mile flight from Ellington Field to Mt. Clemens, Mich., and return, was made in nine days by Lieut. John E. Davis without mechanician and without changing plane or motor. The actual flying time was sixty-four hours, an average of 62.5 miles per hour over the entire distance.

Lieut. Davis followed the same course as the three officers who came to Washington, as far as Dayton, Ohio.

The three naval planes left Philadelphia at 9:30 o'clock and proceeded southward, following the seacoast and Chesapeake bay. Stops were made at several of the naval stations along the coast, and Pensacola was reached in less than a week. The trip was made without accident of any sort. This flight marks a new record in the history of naval aviation.

Peterson Promoted to Major

We have referred on several occasions to the excellent work being done by D. McK. Peterson, a young Lehigh graduate, and it gives us pleasure this week to record that he has recently been promoted to his majority in the Air Service and has been placed in command of his squadron of aeroplanes.

THE CHRISTENSEN ENGINEERING CO., MILWAUKEE WIS.

COMPETITION FOR AERO CLUB ARMY AVIATION TROPHY MAY SOON START

THE Aero Club of America officials have written to Major-General William L. Kenly, the Director of Military Aeronautics, asking that the military aviators be permitted to compete for the three trophies and $1,500 of U. S. Liberty Bond prizes offered by the Club under the Samuel H. Valentine Will, for the development of aviation.

The Aero Club of America offered these trophies and prizes early in October and the first competition for the trophy offered to the First Provisional Wing and for the $100 U. S. Liberty Bond, took place on October 26th during the Aerial Carnival at Belmont Park.

A few days later Mr. Alan R. Hawley, President of the Aero Club of America, received the following letter from Major-General William L. Kenly:

"My dear Mr. Hawley:

"After careful consideration of your letter of October 21st, herewith returned, it is not believed advisable that this project be carried out during the continuance of the present war.

"The attitude of the Aero Club in endeavoring to promote efficiency by stimulating competition is, of course, admirable, and upon completion of the war, propositions of this kind will undoubtedly be very valuable to the Air Service.

"I would recommend that no action be taken on this at present.

"Very truly yours,
"(Signed) W. L. KENLY,
"Major General, U. S. A.
"D. M. A."

Under the offer of the Aero Club of America, each of the four trophies is to cost $1,000, and with each trophy will be given five $100 Liberty Bonds, making five prizes of $100 each to go with each trophy. The idea in giving these Liberty Bond prizes was that while under the rules of the competition, a station or squadron would have to win the trophy three times in succession to get permanent possession of it, the winning station or squadron would get a $100 Liberty Bond prize, immediately upon winning the contest. It is left to the Military, Naval and Marine Corps authorities to decide whether the $100 Liberty Bond prize shall go to the Squadrons, or to the Stations, or the individuals competing.

It is hoped that now that the armistice has been signed, the War Department will grant permission to the military aviators all over the country to compete for these trophies and prizes.

The Aero Club of America has also written to Major General Kenly asking permission to grant the $100 Liberty Bond prize to Sergeant Coombs, who won the race around the Statue of Liberty on October 26th, before the Club was notified by Major General Kenly not to hold competitions for these trophies.

The Aero Club of America has also written to the military authorities who had charge of the aerial carnival asking them for the names of the military aviators who participated in the Aerial Carnival so that a pair of goggles can be presented to each, as the Club had offered to do at the time. The goggles will be presented immediately on receipt of the names from Colonel Harmon, the Commanding Officer of the First Provisional Wing or Major Thomas Hitchcock, who had supervision of the very successful Aerial Carnival on October 26th and who is entitled to great credit for the way in which the whole affair was handled.

Famous French Ace Missing

Paris.—Sub-Lieut. Boyau, one of the famous French aces, is reported to have been missing since September 28. He is credited with thirty-two aerial victories.

Sub-Lieut. Boyau began to figure in the reports of exploits of the French aviators early in the present year. By the month of June his record of aerial victories had reached a total of fourteen. It jumped rapidly during late June and July, until on August 1 it was reported as twenty-nine. Particular mention was made of three victories he scored in late July, each of which was won in not more than ten minutes.

American Official

Washington.—General Pershing has cabled the following:

On October 31 French bombing units attached to the 1st Army successfully raided Mezieres and Poix-Terron and dropped nearly twelve tons of explosives on the important railway in that region. On November 1 our aviators dropped three tons of bombs on the roads and dumps in the vicinity of Tailly, Barricourt and Villers-devant-Dun, and machine gunned enemy troops and convoys. In the course of the day seven enemy aeroplanes were shot down. All our machines returned.

An American aerial patrol on November 1 encountered seven German machines in the region northwest of Verdun. Lieutenants Howard Smith of Hudson Falls, N. Y., and Richard Aldworth of San Antonio, Texas, each brought down an aeroplane. The other German machines escaped.

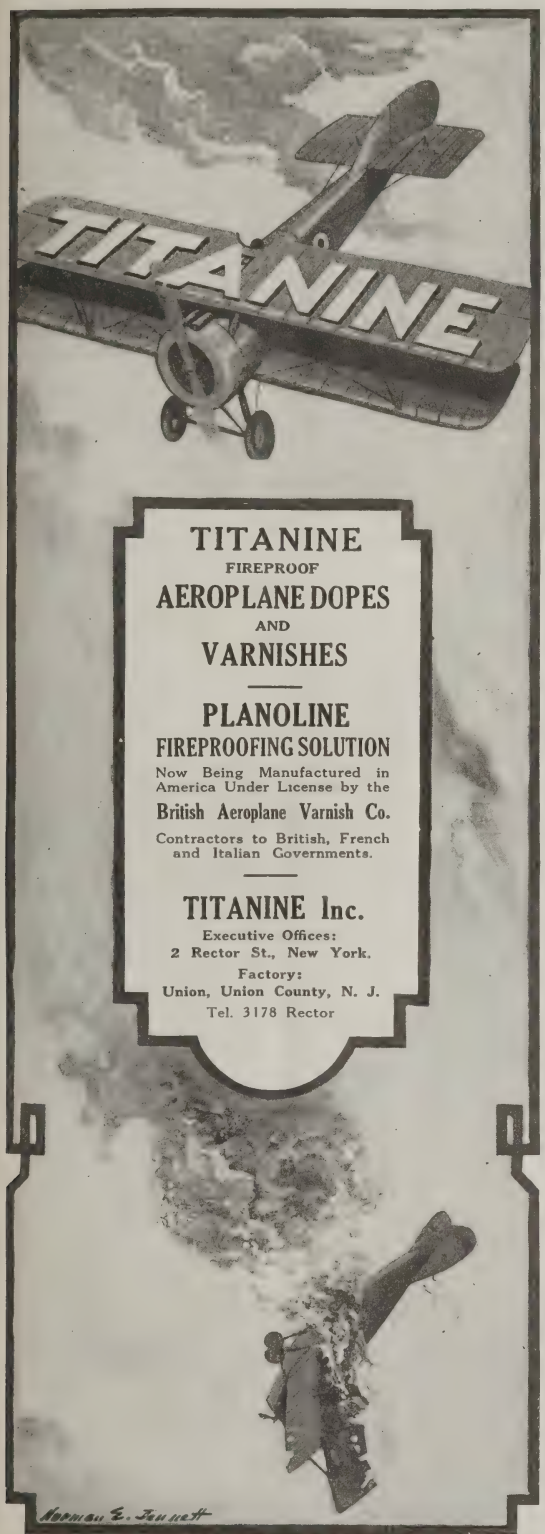
A Record Flight

HALL-SCOTT

TWIN HALL-SCOTT A-5a, 150 h.p. airplane engines powered the Loughead Flying Boat, F-1.

It set a new American Duration Record—211 miles in 181 minutes—Santa Barbara to San Diego—April 12th, 1918—with a Pilot and three passengers.

HALL-SCOTT air-worthiness is based on ten years actual airplane engine building experience. Plant—equipment and organization give a daily capacity of 20 engines, more when necessary.



Send for booklet describing the L-6, Hall-Scott's latest development.

Stake the life of a man or the success of a battle—

against the integrity of an assemblage of metal parts and the question of the bearing's quality becomes a definite thing. ¶ And in aeronautics the stake is all that — and more. So the use of bearings in such service becomes the finest testimonial for their makers. In this respect it's interesting to note that Hess-Bright Ball Bearings are fit to serve.

For, in addition to all the usual qualities of average ball bearings, this Hess-Bright Product has unusual wearing power — due entirely to exceptional choice of metal for their making, combined with painstaking care in their finish. They stand excessive strain and stress with unfailing dependability. It is this that has made them standard.

STABILIZING THE AERONAUTIC INDUSTRY

By HENRY WOODHOUSE

"MAY I urge AERIAL AGE to print an editorial in the immediate future on what can be done to stabilize the aeronautic industry? AERIAL AGE'S foresight in urging aerial preparedness three years before the war brought the first large appropriations and prepared the American aeronautic industry to some extent for the war. During the past year AERIAL AGE had the foresight to begin to plan for the employment of aircraft for peace, thereby educating the country and the aeronautic movement in that important subject and preparing them, in a measure, for the change of conditions that would follow the declaration of peace.

"We have no doubt that AERIAL AGE can be equally effective in clearing up the present confusion and stabilizing the Aeronautic Industry."

This request from a leading aircraft manufacturer summarizes similar requests and the subject of numerous interviews between aircraft manufacturers and the editors of AERIAL AGE during the past two weeks.

What the Government Can Do to Stabilize the Aeronautic Industry

Nothing is more important at this time than to stabilize the aeronautic industry and it is necessary to do so quickly, before aeronautic talent and trained aviators, and skilled labor, look elsewhere for positions.

The Government should be the main factor in stabilizing the aeronautic industry, at least for the next six months, while the plans for the employment of aircraft for special purposes are put into effect.

As Mr. Alan R. Hawley, the President of the Aero Club of America, recently stated to the press, the Hughes' Report shows that the aircraft program was barely large enough to supply the aeroplanes needed to keep our aviators equipped until such time as order is established in Germany, Austria, and Russia. To cancel orders at this time means jeopardizing national safety because the United States was so utterly unprepared that what there is being manufactured at present represents all there is in aeronautic equipment, and that is barely sufficient to equip our aviators until order has been established in Europe.

The Government has cancelled a number of orders for aircraft already. It is hoped that there will be no further cancellations. The program should be continued until such time as the situation in Europe is positively settled.

In the meantime, the aeroplanes could be used for carrying mail. There are thousands of trained aviators in this country ready to take up mail carrying, and the Post Office has received so many requests from all over the country for the extension of the Aerial Mail Service, that several thousand aeroplanes and military aviators could be used for this purpose.

The Revenue Cutter Service and the Life Saving Service need aeroplanes, and could use any number of seaplanes that the Navy may be able to spare.

The Forestry Service can use land aeroplanes to detect fires, and there are a number of other Government Bureaus that can use aeroplanes to speed up the work of their inspectors.

Coast Defenses Still Without Aircraft

As was pointed out in the expert articles by John Hays Hammond, Jr., appearing in the November number of "Flying", our Coast Defenses are still without aircraft. The big guns which protect our coast are still without aerial eyes. Steps should be taken immediately to supply them.

Demand for Aircraft for Civil Purposes Will Support the Aeronautic Industry Six Months Hence

Provided the Government supports the aeronautic industry for six months, the future of the aeronautic industry is as bright as the future of any other industry.

Aeroplanes will be used for pleasure purposes, business trips, and as carriers of express, before many months have gone by.

As we have pointed out repeatedly, a large number of the night and day letters being sent now by telegraph, can be sent to a great advantage and economic saving, as Aerial Mail letters. The Post Office is about to put into effect an Aerial Mail line between New York and Chicago, which will make it possible to deliver night and day letters between the two cities in from seven to eight hours. The sender will be able to send a letter written in his own office, in the same time that it would take to send it by telegraph, and the cost will only be sixteen cents, instead of several dollars for a night or day letter of the same length. The economic saving is so tremendous that the Aerial Mail will be patronized extensively for business and general purposes.

Soon after peace is declared, we may expect thousands of people to purchase aeroplanes, to use them as they use automobiles, for pleasure and travel.

A great many of the two thousand members of the Aero Club of America and the five thousand members of the Aerial League of America have already expressed their intention to acquire aeroplanes as soon as the Government requirements permit manufacturers to deliver aeroplanes for pleasure and travel.

In the near future we may expect to see aeroplanes on the market ranging in price from $1,500 for a one passenger, low-powered aeroplane, to $25,000 for a large ten passenger air yacht. Between these two classes there will be the aerial limousine, and the equivalent of the pleasure cars, ranging in price from $3,000 to $10,000. The aerial limousine, or six passenger air yacht, or the one-ton aerial truck, equipped with Liberty motors will probably cost between $8,000 and $10,000.

Aero Club and Aerial League of America Have Extensive Programs

The proverbial foresight and progressiveness of the Aero Club of America and the Aerial League of America is once more emphasized by the fact that sudden peace finds them as ready as they were when war was declared, and with substantial plans and tangible assets.

Co-operating closely with the Post Office, these organizations have popularized the aerial mail service and created the demands which exists for the extension of the aerial mail service. They have also planned for the general use of aircraft for sport, travel, exploration, passenger and express

carrying, Revenue Cutter Service, Life Saving Service, detection of forest fires, and other purposes, in the United States and possessions, Canada and South and Central America.

The plans are ready and clearly defined. They must now be put into effect.

Seventeen National and International Aeronautic Trophies and Prizes

Seventeen national and international aeronautic trophies and prizes to open for competition are listed in the Aero Blue Book (being published by the Century Company, New York,) as follows:

The Gordon Bennett Aviation Trophy; The Gordon Bennett Balloon Trophy; The Michelin Trophy; The International Marine Aviation Trophy; The American Annual Aerial Derby; The Pan American Aviation Trophy; The $50,000 Transatlantic Flight Prize; The Curtiss Marine Flying Trophy; The Annual National Elimination Aviation Contest; The Annual National Elimination Balloon Contest; The Mackay (Military) Aviation Trophy; The Valentine Trophies of the Aero Club of America; The Collier Trophy; The Pulitzer Trophy.

The competition for these trophies, which is to be arranged by the Aero Club of America in the United States, will do much to popularize the aeronautic sport and aeronautics in general.

The Club has already taken steps to arrange for contests.

NATIONAL AERIAL DERBY PROPOSED BY AERO CLUB OF AMERICA

A NATION-WIDE Aerial Derby, in which all the very best Allied aviators will participate, is proposed by the Contest Committee of the Aero Club of America, to be held next July fourth, in connection with proposed World Peace Celebration to be held in the United States.

This World Peace Celebration was proposed by resolution in the House of Representatives, yesterday, by Congressman Fess, and provides for an appropriation of $500,000. The resolution provides for making July 4th, 1919, "A day of World Celebration to commemorate, in the City of Washington, D. C., the ending of the War, the abandonment of the principle of absolutism in government and the adoption of the principle of constitutional Democracy, established upon the will of the sovereign people."

To make the aviation feature of the celebration country-wide, the Contest Committee of the Aero Club of America proposes that one of the aviation events shall be an Aerial Rally, in which aviators will fly to Washington from practically all of the important American cities, each bringing to the Capitol, and to the Allied representatives assembled at the Capitol, messages and trophies from their respective States and Cities.

The States and Cities would be asked to enter aeroplanes in this Rally, which would officially represent each State or City. As each State has given hundreds of aviators to the Army, Navy and Marine Corps, the Contest Committee feels sure that each State and City will be able to select native aviators to pilot the aeroplanes to the Capitol on this occasion.

The Rally will be a contest under rules to be evolved by the Contest Committee of the Aero Club of America, and the prizes would be awarded to the winners under a system of points, which will give due credit for the distance and weight carried by each of the competitors no matter what distance they may fly from.

The important international feature in this competition will be the International Aviation Trophy. This trophy, which was competed for each year up to the time of the World War, is now in France, and the Contest Committee of the Aero Club of America is communicating with the Aero Club of France and the International Aeronautic Federation, proposing that the competition for the trophy be held in Washington on July 4th, 1919, at the time of the Celebration.

The competition for this trophy would bring to the United States the most famous Allied Aces, and the fastest and best Allied aeroplanes to compete against the American Aces and American aeroplanes.

The Aero Club of America has been advised by many of the Allied Aces of their desire to come to the United States, and it is felt that the American public will certainly welcome the opportunity to pay homage to the brave Knights of the Air who did so much towards achieving victory over Germany.

This event would bring to the United States the greatest aerial rally ever held in the world, and the American public would see in the air on July 4th, 1919, more famous Aces than ever were in the air on one day, even during the Great War.

This gives in brief an outline of what can be done to stabilize the aeronautic industry.

$50,000 TRANSATLANTIC FLIGHT PRIZE RENEWED

THE Aero Club of America has received a cablegram from the Royal Aero Club of Great Britain, reading as follows:

"Daily Mail Cross-Atlantic Flight for $50,000.00 Prize is now open under regulations previously issued."

Mr. Alan R. Hawley, the Chairman of the Contest Committee of the Aero Club of America in making this announcement, issued the following statement:

"There are a number of American aeroplanes under construction for the purpose of crossing the Atlantic in different ways, and we expect that a number of entries for this prize will be made in the near future with the Aero Club of America which represents the Royal Aero Club of Great Britain in the United States.

"The flight with forty passengers made by a British Handley-Page a few days ago and the knowledge that we have of large Caproni aeroplanes which are almost ready to take the air, necessitates haste on the part of Americans who wish to compete for the Transatlantic Prize."

The $50,000 Prize is to be awarded to the aviator who first crosses the Atlantic in an aeroplane in flight from any point in the "United States, Canada or Newfoundland, to any point in Great Britain or Ireland in seventy-two consecutive hours. The flight may be made either way across the Atlantic."

The competition is open to persons of any nationality holding an aviator's certificate, which is issued under the rules of the International Aeronautic Federation by the Aero Club of America in the United States and by the Royal Aero Club of Great Britain in Great Britain. Only one aircraft may be used for each attempt to fly across the Atlantic. It may be repaired en route and will be so marked before starting that it can be identified upon reaching the other side. Any intermediate stops may be made only on the water.

The start and finish may be made from land or water, but at the finish the competitor must cross the coast line in flight.

Considering the development of the aeronautic art during the last three years, the flight is by no means a difficult one. All the problems in the way of success have been solved and the flight may be expected to be made in the very near future.

Looping Record

The Aero Club of America has just received a telegram from Lieutenants Dudley B. Mayer, Maurice A. Sharp and Joe Borden, certifying that Lieutenant William T. Campbell, Officer in Charge of Flying at Love Field, Dallas, Texas, made one hundred and fifty-one consecutive loops with a Curtiss aeroplane. This is the highest record which we know of any one having made up to date since Pegaud made the first loop and proved it to be possible to fly upside down.

We have heard of a record of one hundred and forty-four loops having been made and Lieutenant Carl Batts held the previous record of one hundred and thirty-six consecutive loops, which is also a very recent record.

At the Panama-Pacific Exposition in San Francisco it was considered marvellous when Art Smith made twenty-three consecutive loops in his old type Curtiss pusher machine.

THE NEWS OF THE WEEK

Captain Bartlett Planning Flight Across North Pole

Capt. Robert A. Bartlett is making plans to fly in an aeroplane across the North Pole. He believes he can do it with ease, plant the American flag there and continue his flight on into Asia. He will start on his air trip from Etah, Greenland, and after reaching the pole will fly to Cape Cheluskin, Asia.

Captain Bartlett and some other members of the Aero Club of America look upon the fact as certain of accomplishment. The Captain is now an officer in the United States Army, and if he is not mustered out by July he will obtain an indefinite leave, for it is then that he expects to make the flight. He was with Admiral Peary on his famous dash for the pole, and he is conversant with conditions in the Arctic regions.

In the most matter of fact way he explained to a reporter for *The Sun* recently how he expects to reach the pole. All of his plans are made except that of the aeroplane to be used.

"We could take off in the plane from Etah and fly to the pole, which is 700 miles distant, land there for a very brief survey and observation, plant the American flag on the spot our scientific instruments indicate as the pole, ascend again and continue for another 700 miles and land in Cape Cheluskin," he said. "It would mean a broken flight of 1,400 miles. Gasoline is the only consideration. If I can get a speedy engine with broad planes for the rarefied atmosphere I can make the trip as surely as you will make the trip to your office in the subway."

"How are you going to adjust your carbureter to this intense cold and rare atmosphere?" he was asked.

"I won't adjust it. It isn't necessary. After we leave Etah the air will be cold and probably rare if we fly high, but as we near the pole it will become warmer."

"You know that flowers bloom at the pole, wilt and die and fall in the water, float south and encounter the ice and are frozen in. We often find flowers from the pole frozen in. It is a well-known fact that the ground around the pole and the pole itself is covered with vegetable growth. And, by the way, it is as level as Mineola field. We won't have any trouble landing there." "How high will you have to fly?"

"A thousand feet, maybe more. It depends upon atmospheric conditions and the chemical action of salt water; maybe we'll have to get up a bit after all, but it will not affect the machine."

"How long will it take?"

"Roughly estimating, the first flight will not take more than six hours before we reach the pole. We will stay there long enough to be sure that it is the pole as recorded by the instruments and compass, take a survey of surroundings and note the conditions of the terrain, atmosphere growth and other things that will be extremely interesting to science.

"Then we will crawl into the old bus and fly away to Cape Cheluskin. This, as the trip to the pole, will be a continuous flight and we'll land all safe and sound there. It will be an easy matter to make our way back to the United States.

"It will take a season to make the trip. We will fit out the expedition and go by ship to Etah. It is a simple matter to assemble the plane and tune her up for the flight. Then we'll take off and garner glory for America in America's progressive way, reaching the pole by air," he concluded decisively.

Captain Bartlett will have any number of planes to select from and many of them are now under consideration. Bernard Sanders, of the club's legal committee, is assisting Captain Bartlett in making arrangements.

Gianni Caproni, the famous Italian aviator, has under consideration the construction of an 18,000 horse-power plane which will be capable of carrying a considerable number of passengers. Planes of 5,000 horse-power also are being designed.

Ryan Tells Secret of Aeroplane Radio Phone

One of the secrets of the war was released November 15th by John D. Ryan, Director of Aircraft Production. He said that American pilots fighting in France were directed by their squadron commanders, who talked into the transmitter of a wireless telephone. But the fact that radio communication has been perfected by Americans so that no motor, no propeller, is too loud to drown out the human voice that vibrates through the ether into the ear of the aeroplane pilot is not quite as much of a secret as Mr. Ryan supposes.

The man who perfected this device, who adapted the wireless telephone to the aeroplane and gave the Americans a wonderful advantage over the puzzled German aviators, is Col. Clarence C. Culver, U.S.A., now stationed in Washington. He has been working on it for ten years. As long ago as February 7, 1917, AERIAL AGE printed a report from San Diego, Cal., that Culver, then a captain, had supervised a successful test of radiotelephonic communication between a military plane in flight and a land station.

In making his announcement regarding the use of the wireless telephone on the western front up to the moment the armistice was signed, Mr. Ryan said:

"There are some details concerning it which we cannot discuss yet, but the radio devices worked out during months of experiment went into actual service some weeks ago. I have myself, standing on the ground, given orders to a squadron flying in the air and watched them manœuvre accordingly. The transmission of the voice is clear enough to be heard distinctly through the sound of the aeroplane motor. It is in every way satisfactory."

Mr. Ryan said he could not discuss the distances over which the radio telephone has worked but they are known to be a matter of several miles. It was said in Washington that the Germans got some inkling of what the Americans were doing just before hostilities ceased.

Colonel Culver, when a lieutenant, was an observer of the great aviation meet at Belmont Park in 1910. He was one of the first to appreciate the possibilities of radio conversation from plane to plane and from ground to plane. He went to work on the problem. He and E. J. Simon, a radio engineer of New York, jointly directed the test held in San Diego a year and nine months ago.

Tests Prove a Success

A newspaper despatch, published on the following day, said:

"Flying at an altitude of 800 feet in a tractor biplane piloted by Capt. Herbert Dargue, Captain Culver succeeded in transmitting several verbal messages a distance of approximately three miles. Captain Culver's voice came floating out of the blue sky as clear and distinct as though he were only a few feet from the receiving room.

"Within the next ten days Captain Culver and Mr. Simon expect to have little difficulty in engaging in extended conversations while flying in two distinct aeroplanes many miles apart. The War Department has set aside two Martin military tractors for radio telephone experimentation."

The fifty-three aeroplanes which performed simultaneous evolutions as the closing spectacle of the army meet at Belmont Park, October 26, were directed from the ground by wireless telephone. Only a few of the spectators knew this. Most of them supposed the pilots were "stunting" in obedience to signalling motions of the leading planes, as had been the training custom.

Our Flyers Down 473 in Two Months

In the period from Sept. 12 to 11 o'clock on the morning of Nov. 11, American aviators claim they brought down 473 German machines. Of this number 353 have been confirmed officially. Day bombing groups from the time they began operations dropped a total of 123 tons of bombs within the German lines.

Bombing operations were begun in August by the 96th Squadron, which in five flying days dropped twenty tons of bombs. The first day bombardment group began work in September, the group including the 96th, the 20th and 11th Squadrons. The 166th Squadron joined the group in November.

Except for Sunday and one or two other days the American aviators had unfavorable flying weather during the week previous to the signing of the armistice.

Many spectacular flights were planned for 11 o'clock Monday and just before that hour, but a heavy mist on the entire front prevented all but a few planes from venturing forth.

Lieut. Hitchcock, Boy Air Hero, Home

Eighteen-year-old Lieut. Thomas Hitchcock, Jr., who wears the French War Cross for air victories, and who escaped from Germany into Switzerland after he had been shot down and captured, arrived in New York on Nov. 14th on the U. S. transport Plattsburg.

His father, Major Thomas Hitchcock, executive officer of the flying field in Mineola, and his mother came in from their home at Westbury to welcome him.

"Little Tommy," rejected by the United States Air Service because of his youth—he was only sixteen then—joined the Lafayette Escadrille. He was wounded and captured in a fight with three German planes on March 6 last. On Aug. 28 he arrived in Switzerland, having walked 100 miles in eight consecutive nights.

700 Mile Non-Stop Flight to Yonkers

Claim to a new aeroplane record was advanced November 8 by Major M. J. Boots and Lieut Elmer J. Spencer, United States Army aviators, who on November 7 completed a non-stop flight from Mount Clemens, Mich., to Yonkers, in four hours and fifty minutes.

The officers, flying a two seated Haviland aeroplane equipped with a 400 horse power Liberty motor, ascended at Selfridge Field near Mount Clemens at 11:40 A.M. Until they were in the air they had no notion of attempting a long journey, but shortly after their ascent finding weather conditions ideal and their motor running perfectly they decided to attempt to reach Mineola without coming down.

Flying east by north until they were over Ottawa they then hauled their course and proceeded in a general southerly direction, flying across the Adirondack region and down the Hudson Valley as far as Yonkers. They were obliged to land at Yonkers because their supply of fuel was running low. Their landing was made at 4:30 in the afternon and ended a flight which they estimate to have been not quite 700 miles in length.

They landed in a field on Seminary avenue in Yonkers owned by Gideon H. Peck, whose house, close by, was filled with guests helping him celebrate his seventy-fifth birthday and Thursday's premature peace report. The aviators were literally dragged into the house by the enthusiastic merrymakers, who tried to induce them to join the party and accept the hospitality of the house over night.

Lieut. Jack Rutherford, U. S. Navy Air Service, Mrs. Rutherford and their charming little family

Rinehart Sets New Dual Passenger Mark

Dayton, O.—By attaining a height of 22,400 feet while carrying Milton Baumann, an employe of the Dayton-Wright Aeroplane Company as observer, Howard M. Rinehart, chief pilot for that company, broke the altitude record with a passenger during a flight from South Field, Moraine City, on November 2. The fact that Mr. Rinehart had established the new record came to light a week after the remarkable feat was performed, from an outside source. Had not a newspaper man questioned Rinehart concerning his achievement, it probably would never have become publicly known.

The record was established during a flight being made by Rinehart and Baumann on a piece of testing work, the nature of which is kept secret. The test required certain performance from a De Haviland 4 aeroplane, driven by a Liberty motor. The day was perfect for altitude flying, and after attaining a height of 21,500 feet, a pinnacle reached many times before by Rinehart, he decided to continue climbing. This he did until the record height of 22,400 feet had been reached.

Upon landing, the instruments on the machine which Rinehart had driven to the dizzy height were tested by government instruments at McCook field. It was then that it was found that the register named above was correct.

In spite of that fact that a new record had been established, Rinehart has refused to make official claim to the distinction through the medium of the Aero Club of America, the one American organization empowered to confer it. The fact that the feat had been performed, however, reached New York, and queries were sent to this city concerning it.

Rinehart and Baumann found a temperature of approximately 15 degrees below zero while at their greatest height. They maintained the maximum altitude for about 30 minutes. From their position, Dayton, Springfield, Eaton and Greenville were closely within sight.

With the establishment of a new altitude record by a pilot carrying a passenger, both the dual and single-passenger altitude records have been made in Dayton within the last few months. It was only a short time ago that Captain Schroeder attained a height of 28,900 feet without a passenger, thus establishing a record for a single-passenger altitude attempt. Rinehart said that it was because of the difference between the single passenger record and the double that he had not taken the pains to claim official recognition of his record.

Rinehart is one of the foremost civilian fliers in America. He has been piloting aeroplanes for the last six years, and was for a time chief flier with the Villa forces in Mexico. He resides in this city.—*Dayton Sunday News.*

Prairie Aerodromes in Canada

An air control station is to be established at Winnipeg within the next few weeks.

It is proposed that similar stations shall be established at Fort William or Port Arthur, Regina, Moose Jaw, and other points between there and the Pacific Coast. The Board in charge of the publicity work for the "Victory Loan," propose to stimulate enthusiasm throughout the Dominion by exhibition aeroplane flights, during which airmen will drop literature advertising the loan.

Count Jacques de Lesseps Decorated

Most of the early pioneers of flying are now past active participation in the war and have to confine their efforts to keeping up the supply of aircraft. It is all the more gratifying, therefore, to hear that Comte Jacques de Lesseps, who was the second aviator to fly across the Channel, has just been awarded the Cross of the Legion of Honour for bombing work and for six long reconnaissances involving a good deal of low flying. He has been four times mentioned in Orders.

Charting Air Lanes

WASHINGTON.—Charting air lanes over the United States has been begun by the army. These charts are mosaics made with stereopticon cameras, showing such land marks as waterways, railroads, cities, and mountains for pilots to follow.

From Kelly Field instructors and members of their classes work with the aid of aeroplanes carrying cameras and motor trucks carrying photographic material and supplies and a portable darkroom for developing plates and films. Such an outfit is usually set up in some town in the district to be photographed, which has a landing field adjacent. The men employed in the work are rationed from this camp, and the developing and printing of the films and plates delivered by the aeroplanes are all done here. As fast as one district is finished the outfit moves on to the next.

Douglas Campbell Comes to New York

The American ace, Capt. Douglas Campbell, who has seven enemy planes to his credit, has left Bolling Field to report at New York.

Largest Seaplane Flies Over Washington

The largest seaplane in the United States, the *U. S. S. Nancy I*, flew over Washington on the afternoon of Nov. 8 enroute to Hampton Roads. It carried fifteen officers. This mammoth seaplane flew from a coast patrol station near New York on Nov. 7 and stopped at the Anacostia naval aviation station on Friday morning.

The *Nancy I* has a wing stretch of a hundred and twenty-six feet, and is propelled by three twelve cylindered liberty motors. The pilot has his seat and engine controls between the lower and upper wings. Above the top wing, in the center of the plane is the observer post. Below the lower wing seats for four are fixed, and below that the boat part of the plane has a capacity for a number of observers.

Several officers witnessed the start of the plane on the Potomac from a navy launch. Admiral Taylor of the Bureau of Construction and Repair, Admiral Griffin of the Steam Engineering Bureau and Captain Steele, director of Naval Aeronautics, inspected the plane before the start for Hampton Road.

The plane has a fuel capacity of 300 gallons of gasolene and is used on coast patrol duty, requiring much flying with little opportunity for replenishing gas reserve.

Stops Admissions to Officers' Camps

The War Department has issued orders discontinuing the acceptance of applicants for the central officers' training camps and stopping the organization of any new classes. This order will stop all admissions to the camps, it is understood. There are now about 100,000 men in training.

The November classes will be discontinued and a decision is expected soon as to whether present classes shall be continued to graduation.

None of the additional training camps for officers that had been planned will be established. This includes the Camp Fremont, Cal., camp, to which many District men were to have gone.

For Bonus to Soldiers

A bill granting one month's furlough with full pay to all officers and enlisted men in each branch of the service who have served in the present war has been introduced by Senator Trammel of Florida.

Under its provisions, the furlough would be granted as nearly as possible so as to conclude the term of service, and in effect the bill would bring about the granting of a bonus amounting to one month's pay to each man.

Smithsonian Institution War Collection of the U. S. National Museum

Washington, D. C.—The U. S. National Museum is now assembling and has recently begun the installation of a collection of material relating to the present war which will form one of the most important ever shown in the Museum. The object of the collection is to preserve and exhibit for the benefit of the public a series of objects graphically illustrating the military and naval activities of all of the countries engaged in the war—the United States, its Allies, and the enemy—and will in addition to the military and naval features, include foods and other economic specimens. The immense value of such a museum collection when once assembled cannot be over estimated either from the popular or scientific point of view. It will not only form a fitting and serviceable supplement to the written and printed records relating to the history of the war, but it will also constitute a most notable memorial to the patriotic forces represented by the individuals who have contributed to the preservation of civilization and democracy in the present great crisis.

The collection will have in the aeronautic department Air Service Equipment, including aeroplanes and other accessories of this most important branch of the military war activities. Perhaps the most important single objects already installed in the collection are a number of aeroplanes showing the types of the machines of this character used during the present war. Of these, two machines have been installed in the south hall of the Museum building. One is a Voisin plane of 1917 model used in the French Army for bombing at night, the other a Caudron plane of 1917 model used in the French Army for photographing and reconnoitering. Both of these were purchased by the United States Government from France last year and at that time were regarded as the latest types. An up-to-date U. S. Army training plane has just been added to this portion of the collection.

The collection contains also a distinguishing flag of the Zeppelin L-49 captured at Bourbonne les Bains, France, October 17, 1917, and a fragment of the gas bag and outer envelope of the Zeppelin.

Photo of Rio de Janeiro taken from one of the Brazilian naval seaplanes

ONE HUNDRED AND FORTY-NINE AEROPLANES FLY IN LARGEST FORMATION IN AMERICA

Cadet A. R. Metcalfe

Waco, Texas.—One hundred and forty-nine aeroplanes in formation flight, the largest formation ever known to take the air this side of the big show, was the rare treat presented to the citizens of Waco on November 2 in celebration of the opening of the annual Cotton Palace Exposition in connection with which is appearing the U. S. and Allied Governments Official War Exhibit.

That such an immense undertaking could be staged without a single ship being forced to descend, without the least sign of mishap or trouble with engines or ships, reflects the highest credit upon the flyers who participated and equally upon the officers of Rich Field under whose auspices this remarkable event was staged.

Through the good offices of Major John A. Whitesides, commanding officer of Rich Field, it was arranged for ships and flyers from every flying field in Texas to participate. First Lieut. Maurice A. Sharp, officer in charge of flying, arranged the details of this great flying pageant, and much credit is due him for its success.

A sight, rare even to experienced flying men, was presented when promptly at 9 A.M. the entire number of ships entered—one hundred and forty-nine in number—drew into position on the field, props flashing in the sun, engines throbbing to be off, all arranged in fourteen perfect ranks of "company front" from nine to thirteen ships in each row. Each row of ships comprised a unit or squadron, and the fourteen units in file made up as great and impressive a formation as was ever witnessed.

The first unit, composed of nine Rich Field ships, was led by First Lieut. M. T. Chamberlain, Asst. Officer in Charge of Flying, followed by First Lieut. H. G. Andrews, Second Lieuts. D. W. Crump, E. H. Miller and E. E. Glenn and Civilian Instructors J. P. McGrath, G. E. (Buck) Weaver, A. W. Claverie, and Dan E. Davidson.

The five succeeding units of the formation were likewise composed of Rich Field ships with Rich Field pilots and were led respectively by Lieutenants M. D. Mann, M. G. Kregle, J. O. Nelson, E. E. Hughes, George O. Berg.

Brooks Field at San Antone was represented by a crack squadron of flyers led by Captain McCready, Officer in Charge of Flying at Brooks.

Carruthers field at Fort Worth sent down a contingent of flyers who well deserved the praise they received for the excellence of their formation work. A number of Cadets, well along in their training, piloted some of the Carruthers machines. Lieut. Ayers of Carruthers was in charge of this group.

The squadron from Taliaferro Field was led by Major Macauley; that from Barron Field by Lieut. Burton, and those from Kelley Field by Lieut. Dorsey. Love Field at Dallas sent 13 ships under the leadership of Captain Wooten.

A number of pilots assigned to the Second Provisional Wing, stationed at Ream Field near Houston, came up in a squadron, and a number of Ellington Field ships entered also.

The ease and precision with which the formation was got under way is counted as an especially noteworthy feature in view of the large number of ships which were to be marshalled into position and started off within so short a time. The arrangement of the ships by unit squadrons in the fourteen rows for the take-off solved this problem.

At the signal to start, the centre ship of the first line, Lieut. Chamberlain piloting, took off, followed at three second intervals by the succeeding pairs of ships comprising this unit. The thirteen remaining ranks took off in turn in the same manner and without the slightest confusion, until within a space of five minutes there could be seen winging away to windward a total of 149 planes, each in proper place and each holding position without the slightest difficulty. At 1000 feet altitude, the leading unit swung off to the east followed by a stream of orderly "V's," gaining altitude and encircling the city, flying directly over the downtown section and across the Exposition Grounds where 60,000 people were craning their necks in an effort to encompass in a single glance the length and breadth of the spectacle above.

Upon the breaking up of the formation there followed a perfect galaxy of stunt flying directly over the city, during which every conceivable trick known to stunt flying was staged. Lieut. Chamberlain's No. 1 Unit staged a flying circus all its own. At the break-up signal, the nine ships in the "V" drew up abreast of the leader into a perfect line whereupon the nine ships looped simultaneously. This clever feat was followed by individual stunting over the very roof-tops of the business section which afforded more thrills to Waco in five minutes than it is credited with having experienced in the last five years. One nervy pilot spiralled down below the sixth story of Waco's one and only skyscraper, the Amicable Building of 20 stories.

"Buck" Weaver and Walter Claverie, Civilian Instructors at Rich Field, furnished additional

(*Continued on page* 585)

THE "LANGLEY" at Erie, Pa.

THE Handley Page bombing machine "Langley", built by the Standard Aircraft Corporation, did its part in helping the recent Liberty Loan Drive by flying from Mineola, L. I., to Utila, Buffalo, N. Y., Erie, Pa., and Dayton, Ohio.

The plane was driven by two Liberty Motors and piloted by Captain E. B. Waller of the British Royal Air Force. The other members of the crew were Lieutenant G. Beck of the United States Air Service, "Doc" Allen, Chief of the Flying Instruction, U.S.A. R. M. Brown, Liberty Motor expert; A. Berndt of the British Air Board, Sergeant McAfee, U. S. Air Mechanic, and L. Milani, mechanic.

After distributing Liberty Loan Literature in Utica the big bomber flew to Buffalo and circled over the city dropping more Liberty Loan circulars. Without landing the Aeroplane continued on to Erie where it was received on Friday afternoon by the officers and employees of the Erie Specialty Company which made most of the 4000 odd nuts and bolts in the construction of the aircraft.

The Fliers spent the night in Erie and early on Saturday proceeded to Dayton, Ohio, where they were received with great enthusiasm.

The "Langley" was described in AERIAL AGE at the time of its launching in Elizabeth, N. J., in July 6. It measures 100 feet from wing tip to wing tip and the body is 65 feet long. Two Liberty Motors of 400 h.p. The gas tank holds 400 gallons and the oil tank has a capacity of twenty gallons. The "Langley" weighs 9,000 pounds and carried two tons of useful load.

Mr. W. C. Adams, plant manager of the Erie Specialty Company engineered the entertaining of the fliers at Erie. The Erie Board of Commerce and the Erie Exposition Association also assisted in the entertaining.

The crew of the American-built Handley-Page biplane "Langley"

The AIRCRAFT TRADE REVIEW

N. E. J.

Aeroplane Testing Fields Transferred to Division of Military Aeronautics

By an agreement between the two divisions of the Air Service, the acceptance parks or testing fields located at Dayton, Ohio; Detroit, Mich.; Buffalo, N. Y.; and Elizabeth, N. J., have been transferred from the jurisdiction of the Bureau of Aircraft Production to the Division of Military Aeronautics, and the method of testing the finished product is now undergoining a complete change.

3,878 Libertys in October

Washington.—Three thousand eight hundred and seventy-eight Liberty engines were produced in October as compared with 2,378 in September, an increase of 1,500. This increased production was made despite influenza, which threatened to hamper the output of the various factories. The quota set for September was 2,500 engines and the actual number shipped was 2,378. The quota set for October was 3,000. The competition among the various factories has now become a race with each concern showing keen interest.

To Make Propeller Material

Hayward, Wis.—The American Veneer Co. has been organized at Hayward, Wis., with a capital stock of $100,000, and will erect and equip a new plant for the manufacture of aeroplane veneers, propeller material, gun stocks and similar hardwood products for military and naval purposes. George C. Glover, head of the Willow River Lumber Co., Hayward, is president and general manager of the new concern.

Personal Pars

A. H. Doolittle, formerly sales and advertising manager of the Zenith Carbureter Co., Detroit, has joined the publication division, service department, Bureau of Aircraft, in Detroit.

Archibald Black, recently aeronautical engineer of the L-W-F Engineering Co., College Point, N. Y., has become aeronautical engineer with the Bureau of Construction and Repair, Navy Department, Washington, D. C., and began his duties there October 21, 1918.

Glenn Martin Develops 180-M.P.H. Bombing Plane

Washington.—A bombing plane designed by Glenn Martin which is said to have developed a speed of 180 m.p.h., is receiving the attention of both the Senate Military Affairs Committee and the Bureau of Aircraft Production. This plane was mentioned in conference between the members of the War Department and the committee. There have been rumors here that there was a new high-powered plane designed, and that it would supersede the Handley-Page and Caproni in our program. Although the report of a new plane has been confirmed in the acknowledgment that Mr. Martin has designed one, nothing definite can be learned at this time regarding its superiority over the Caproni or Handley-Page.

Adopt Specifications for Gasoline

Washingfon.—Following conferences between the Specifications Commission of the Allies and the American Committee on Standardization of Petroleum Products, standard specifications for motor and aviation gasoline have been adopted.

Under these specifications aviation gasoline has a far higher end point than commercial grades of fuel; motor gasoline, which is for the use of motor transport vehicles, is slightly different from the commercial grade. Ordinary commercial gasoline has an end point of approximately 450 deg. Fahr. Under the new specifications aviation gasoline has an end point of 347 deg. Fahr. for domestic purposes and 257 deg. Fahr. for the fighting grade, and motor gasoline of 420 deg. Fahr.

Mr. L. G. Randall, Superintendent of Plainfield Plant of the Standard Aircraft Corp.

Following are the specifications as adopted by the Commitee on Standardization of Petroleum Specifications:

Specifications for Aviation Gasoline

1. *COLOR:*—The color shall be water white. *Test*—Inspection of a column in a standard 4-ounce oil-sample bottle.

2. *FOREIGN MATTER:*—The gasoline shall be free from Acid, undissolved Water and Suspended Mater.

Acid Test: The residue remaining in the flask after distillation is completed is shaken thoroughly with 1 cc. of distilled water. The aqueous extract must not be colored red on addition of a few drops of methylorange solution. *Water and Suspended Matter* would be in evidence in the test for color.

3. *DOCTOR TEST:*—The gasoline shall yield a negative doctor test.

Directions for making doctor test on gasoline:

(A) *Preparation of reagents:*—Sodium Plumbite or "doctor solution": Dissolve approximately 125 grams of Sodium Hydroxide (NaOH) in a liter of distilled water. Add 60 to 70 grams of litharge (PbG) and shake vigorously for 15 to 30 minutes, or let stand with occasional shaking for at least a day. Allow to settle and decant or siphon off the clear liquid. Filtration through a mat of asbestos may be employed if the solution does not settle clear. The solution should be kept in a bottle tightly stoppered with a cork.

Sulphur: Obtain pure flowers of sulphur.

(B) *Making of Test:*—Shake vigorously together two volumes of gasoline and one volume of the "doctor solution" (10 cc. of gasoline and 5 cc. of "doctor solution" in an ordinary test tube; or proportional quantities in a 4-ounce oil-sample bottle may conveniently be used). After shaking for about 15 seconds, a small pinch of flowers of sulphur should be added and the tube again shaken for 15 seconds and allowed to settle. The quantity of sulphur used should be such that practically all of the sulphur floats on the surface separating the gasoline from the "doctor solution."

(C) *Interpretation of Results:*—If the gasoline is discolored, or if the sulphur film is so dark that its yellow color is noticeably masked, the test shall be reported as Positive and the gasoline condemned as "sour." If the liquid remains unchanged in color and if the sulphur film is bright yellow or only slightly discolored with gray or flecked with black the test shall be reported Negative and the gasoline considered "sweet."

4. *CORROSION AND GUMMING TEST:*—The gasoline when subjected to the corrosion test shall show no gray or black corrosion and no weighable amount of gum.

Directions for Making Test:—The apparatus used in this test consists of a freshly-polished hemispherical dish of spun copper, approximately 3½ in. in diameter.

Fill this dish to within ⅜ in. of the top with the gasoline to be examined and place the dish upon a steam bath. Leave the dish on the steam bath until all volatile portions have disappeared.

If the gasoline contains any dissolved elementary sulphur, the bottom of the dish will be colored gray or black.

If the gasoline contains undesirable gum-forming constituents, there will be a weighable amount of gum deposited on the dish.

Acid residues will show as gum in this test.

Interpretation of Results:—CORROSIONS: It is specified that no gray or black deposit shall be formed. This wording is intended to admit gasolines that have so small a quantity of sulphur that the deposit is peacock colored.

GUM: It is specified that there shall be no weighable amount of gum. The intention is to refuse admittance to gasolines that show an amount that can be readily weighed in this style of dish.

The distillation method and apparatus shall conform to those outlined and described in Bureau of Mines Technical Paper No. 166, entitled "Motor Gasoline, Properties, Laboratory Methods of Testing and Practical Specifications."

Volatility and Distillation Range—Export Trade

When 5 per cent of the samples has been recovered in the graduated receiver the thermometer shall not read more than 149 degrees Fahr. or less than 122 degrees Fahr.

When 50 per cent has been recovered in the receiver the thermometer shall not read more than 203 degrees Fahr.

When 90 per cent has been recovered in the receiver the thermometer shall not read more than 257 degrees Fahr.

When 96 per cent has been recovered in the received the thermometer shall not read more than 302 degrees Fahr. and the end point shall not exceed this temperature by more than 27 degrees Fahr.

At least 96 per cent must be recovered in the receiver from the distillation.

The Distillation Loss shall not exceed 2 per cent when the residue in the flask is cooled and added to the distillate in the receiver.

Volatility and Distillation Range—Fighting Grade

When 5 per cent of the sample has been recovered in the graduated receiver the thermometer shall not read more than 158 degrees Fahr. or less than 140 degrees Fahr.

The Italians have been flying large machines from snow for the past three years. This shows a Caproni biplane in winter surroundings

Ready for New York-Chicago Aero Mail Service

Chicago.—Capt. B. B. Lipsner, Superintendent of Aerial Mail Service, received a telegram from Otto Praeger, Second Assistant Postmaster General, on November 18 requesting him to have all hangars, oil tanks and other equipment in readiness the first week in December for the regular aero mail service between Chicago and New York. The telegram said an aeroplane will reach Chicago about December 5 to make a trial flight.

AERIAL MAIL OPERATION FOR THE MONTH OF OCTOBER 1918.

Date 1918	Miles flown	Hrs. of Flying		Mail Carried		Percent of Performance	Arrival	
		hrs.	min.	A.	O.		Wash.	N. Y.
Oct.	1.	2.		3.		4.	5.

Ttl.	12,167	161	35	939¾	15,848½			

*Forced landing. Mail sent in by train.

Note: Number of hours dead flying for the month, 10 hours, 36 minutes.

Explanation of Tabulation;

1. **Miles flown;**
   Leg from Washington to Philadelphia..128 miles
   Leg from Philadelphia to New York.... 90 miles
   Miles flown for the day, whether one, two, three or four legs of the trip have been made.
   The aim is to get exactly the number of miles flown in connection with the mail service each day. Therefore, mileage of partial trips should be indicated.
2. **Hours of flying;** To include the actual hours and minutes machine is in the air with mail.
3. **Mail carried;** In this column, under A., give pounds of aeroplane mail; and under O., give pounds of ordinary mail.
4. **Percent of Performance;** Round trip Washington-New York consists of four legs, each leg valued at 20% if completed by aeroplane and not by train before close of day.

PERFORMANCE OF AVIATORS DURING THE MONTH OF OCTOBER. 1918.

Total possible number of flights	108
Total possible mileage	11,772
Total perfect (uninterrupted) flights made	105
Total interrupted flights made	2
Total flights defaulted on account of weather	0

Pilot	Perfect Flights		Forced Landings		Total Flights	
	No.	Miles	Interrupted Flights	Uncompleted Flights	No.	Miles

5,000 H. P. Planes May Carry Mail Across Atlantic Ocean

By Frederick M. Kerby
N. E. A. Staff Correspondent

New York.

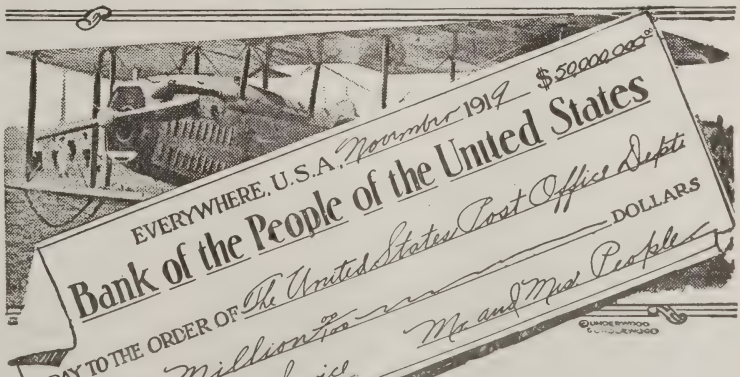
Fifty million dollars' worth of aerial mail and 25,000,000 worth of parcel post business is awaiting the time when the plans already made by the Postoffice Department are fully carried out and the aeroplanes and pilots that the war is producing are at the disposal of the postal authorities for mail-carrying.

However startling such an estimate may seem, this is actually a conservative business calculation.

Henry Woodhouse, a governor of the Aero Club of America, has made a study of the possibilities of mail-carrying by aeroplane.

"Aircraft capable of lifting fifteen tons, with a speed of 100 miles an hour, are now in actual production," he said. "The first of the American-built Caproni planes, equipped with four Liberty motors and developing 1,750 horsepower, has just been successfully tested. This giant plane has a total lifting capacity of 40,000 pounds, or 20 tons. The super-Handley-Page or the Caproni could easily carry fifty bags, or more than a ton of mail. This means 100,000 letters. Judging the future development of aircraft by what has taken place in the last two years, we may look for the building of a 5,000 horsepower aeroplane, possibly within a year.

Four Hundred Miles a Day by Postplane



"If the people of the various cities along the eight great airways already proposed insist on it, at least a dozen additional aerial mail lines can be established within twelve months," Woodhouse continued. "This can be done by utilizing only machines not needed by the army or navy. That means it will be possible to send by postplane at least 50,000,000 of the 100,000,000 day and night letters, and at least 25,000,000 of the 50,000,000 special delivery letters that are sent each year in the United States.

Postoffice officials estimate that the average cost of telegraphic day and night letters now going over the wires is close to $1 each. Special delivery letters average about 13 cents apiece.

"This makes a total of more than fifty million dollars' worth of potential aerial mail business that is simply waiting for the establishment of aerial mail routes which can easily be established within the next twelve months.

"Four hundred miles is the distance over which postplane day mail is most effective. Aerial mail letters are effective over any distance, since, with proper stations, light signals and guides for night postplane flying, the air mail can be carried more than 1,000 miles between the hours of 6 P. M. and 8 A. M.

A check which, in line with modern development, should be honored this year

THE WORKING PROCESS OF INTERNAL COMBUSTION ENGINES

By E. H. SHERBONDY

DURING the past fifteen years the commercial development of the internal combustion engine has come forward from a place of questionable utility to a necessity of the first rank in the public mind, and has undergone a process of remarkable improvement from a mechanical viewpoint. Perhaps no other invention has brought the meaning of the word "efficiency" into so much prominence, in this industrial era, than has the internal combustion engine.

Through the forty years prior to the commercial development of the internal combustion engine, inventors devised many new fundamental schemes for heat engines, only a few of which were destined, however, to an important commercial development. A brief historical review allows us to compare the important inventions in this field and permits us to show how the efficiency of the internal combustion engine has been increased in the sixty years past.

In spite of the remarkable mechanical development shown in the construction of gas and oil motors and particularly those for use in the propulsion of *vehicles where specific output* is a matter of greatest concern investigation of the physical and thermo-dynamic problems encountered have been few. Aeroplanes, motor cars, motor boats, in which the horsepower per pound of weight required is of prime importance as well as is the fuel consumption efficiency.

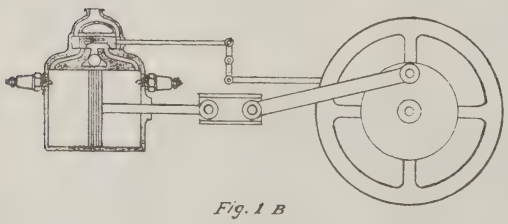
The future development in this field, however, calls for an increasing amount of technical information concerning the working process (*heat-work conversion process*) of internal combustion motors.

Lenoir Engine First

Fig. 1 shows the Lenoir engine to have been the first double acting two-stroke engine. Lenoir failed to realize success with his engine owing to its low efficiency as contrasted with the steam engine of that day. The actual working efficiency was 4% of the heat energy supplied, and this low efficiency is attributable to the small expansion ratio (no compression, small expansion), and also because the amount of heat transmitted to the walls was relatively large, due to the long time the cylinder walls were exposed to the burning and expanding gas and the enormous superficial area of the combustion chamber.

THE LENOIR ENGINE
DOUBLE ACTING TWO STROKE.

Fig. 1 A



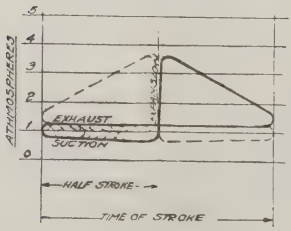


Fig. 1 B

In 1873 Julius Hock of Vienna produced the first petrol (gasoline) engine operating on the Lenoir cycle.

About the time of the appearance of the Lenoir gas engine M. Beau de Rochas patented a gas engine based on the following postulates:

1st. The largest volume of gas with the smallest possible enclosing surface.

2nd. The highest possible speed of the working piston.

3rd. The greatest possible expansion ratio.

4th. The maximum pressure at the beginning of the working stroke.

It was not, however, until 1876 that the Beau de Rochas cycle was approximated in a working engine by Dr. N. A. Otto, of Cologne, Germany, who founded The Gasmotorenfabrik Deutz, Cologne, and it was to Otto's inventive and practical work that we owe the remarkable development of the internal combustion engine as we have it today, since all the cycles of operation in use utilize at least the essentials of Otto's 1876 gas engine.

We will now proceed to a discussion of Otto's gas engine. In Fig. II the piston strokes and theoretical corresponding gas pressure are indicated graphically by the lines and curves AB, BC, CDE and EF. In the first piston stroke from A to B we have a horizontal line practically, representing admission at atmospheric pressure; from B to C the pressure rises from 1 atmosphere to 5, 6, 7, 8 or 9 atmosphere, as the case may be, which pressure is said to be the compression pressure. At the end of this second stroke ignition is applied to the combustible mixture and the pressure rises rapidly, almost instantaneously from C to D, all of the mixture having burned, expansion follows during third stroke from D to E. At E the exhaust is opened and scavenging of the burned gases continues to F during fourth stroke at substantially atmospheric pressure.

In Fig. III we unite the curves of gas pressure to form the theoretical indicator diagram. Fig. IV also shows the indicator plotted above the corresponding piston motion diagram.

In designating the theoretical diagrams shown in Figs. II, III, and IV we have assumed that:

1st. Admission of the change takes place at atmospheric pressure and scavenging (exhaust) takes place without back pressure.

2nd. Combustion is instantaneous, at constant volume and no heat is lost during the process of ignition.

3rd. Combustion is complete and perfect.

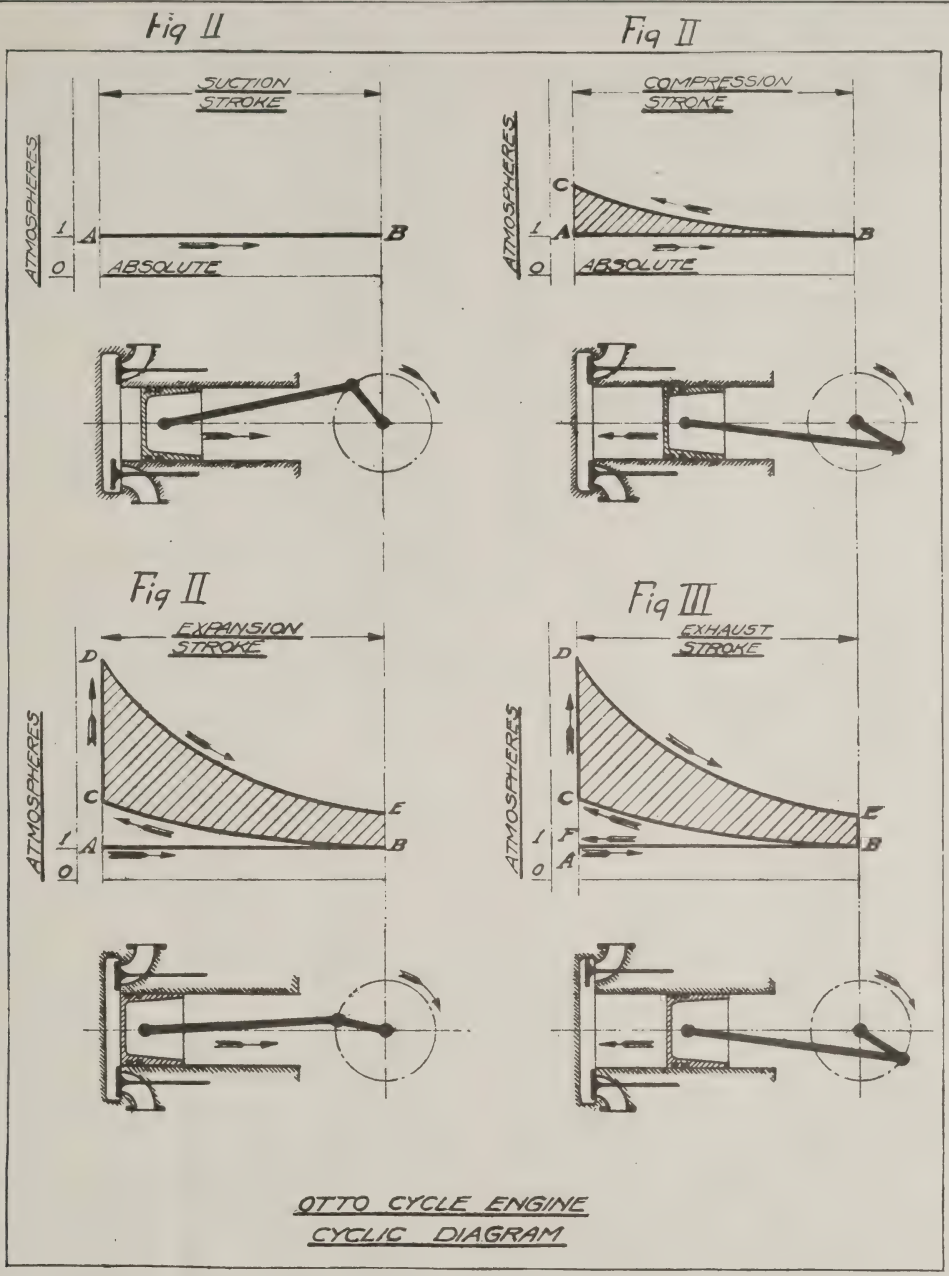
4th. Expansion is complete and adiabatic.

In reality each of these hypothesis are without foundation and the discussion to this point is only an approximation of the natural process undergone during the cycle of operation.

1st. Admission and exhaust involve back pressure, caused by the frictional resistance to the movement of gases through the port and valves, and further important heat interchanges take place between the combustion chamber, cylinder walls and the gaseous contents.

2nd. Ignition of the combustible mixture does not take place instantaneously, but in certain period of time, varying from 1/10 of a second to 1/300 second, during which period the piston is in motion and the volume varying. Also heat is lost to the walls of the combustion chamber (which are at low temperature).

3rd. Combustion is not completed ordinarily during the rise of pressure following ignition, and continues during a portion of the expansion.



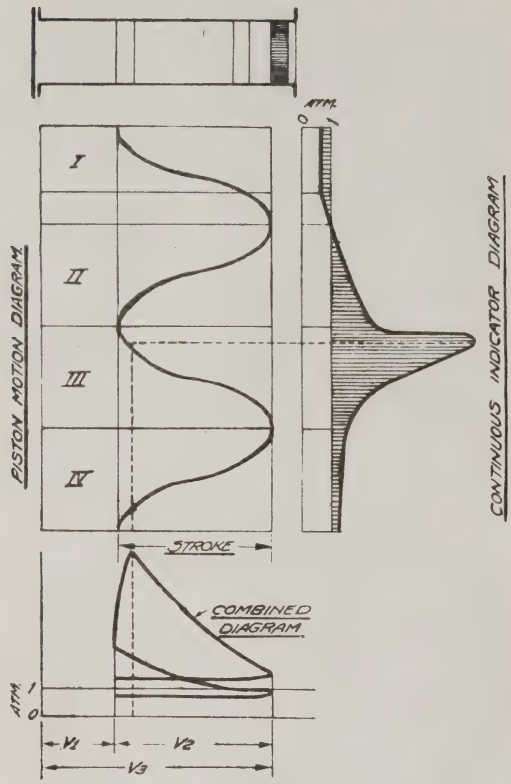
4th. Expansion is incomplete and can not be adiabatic since heat is lost to the cylinder walls.

As has been seen the working cycle of Otto's engine is distributed over four portions of time and has been called half acting, or is said to be of the four stroke cycle type.

It may be remarked that Otto's engine is a compression pump during the first and second phases, it sucks in and compresses the mixture; it is only during the third and fourth phases that it is a driving engine and conducts a real working process. The two processes can be separated suction and compression undertaken in a special cylinder, a compression pump, and during the compression the mixture can be forced into the second cylinder (power cylinder) in which combustion, expansion and scavenging occur.

This latter method of operation was developed by Clerk, Körting, Witting and Hüs, von Occhelhaüser and Junkers and is known as the two-stroke cycle. Of this method of functioning Gülchner says, "It is certain that the two-stroke cycle of work must serve as the basis for future progress in internal combustion motors, and to the exclusion of all other cycles."

This view at first championed by only a few engineers and constructors is rapidly finding favor among gas and oil engine builders, where the problems of size, weight, and first cost make it imperative that material be put to its best use.



Daimler and Fernand Forest

Together with Otto and Langen, Gottlieb Daimler, founded the Gasmotorenfabrik Deutz at Cologne, Germany, in 1872. Ten years later he separated from the Deutz Company, retiring to Cannstadt, Germany, where he conceived and developed motors operating at the then considered frightful speeds of 500-800 r.p.m. First conceived of for use in small boats, Daimler's motor was later applied to two-wheeled vehicles in 1886, later on tricars, and finally four-wheeled carriages. Daimler was first to see and take advantge of the possibilities of high crank shaft speeds, and his brilliant and indefatigable efforts resulted in the foundation of the motor vehicle industry. Daimler's remarkable mechanical improvements resulted in improved functioning and increased specific output, however, his work was of mechanical rather than thermodynamic character.

Fernand Forest

Working independently and with prodigious energy, Fernand Forest, Paris, France, designed and built a great many motors of the four-stroke cycle type. Commencing in 1881 with a single cylinder gas engine, he proceeded to the development of gasoline engines with opposed pistons in 1885, a four-cylinder vertical block motor in 1889, two six-cylinder motors between 1889-1891 and a four-cylinder vertical motor, utilizing mechanically operated poppet valves, enclosed crank chamber, copper water jackets, magneto ignition. In each of these featural developments Forest appears to have been first, his work, however, was almost unknown and he died without attaining financial success, although his motors were the prototype of our modern vehicle motors. Recognition for Forest's inventive genius was secured in 1910, by the combined efforts

Fig. IV

of Marquis De Dion, Arch Deacon Georges Gallice, Paul Faure, H. Dunnod and Chas. Faroux, all of Paris, France.

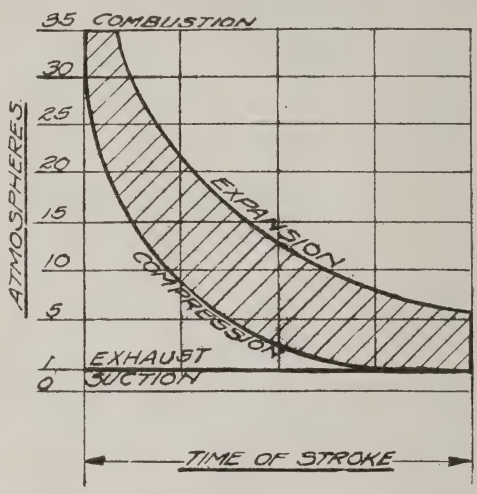
Diesel's Heat Motor

In 1893 Rudolph Diesel, Berlin, edited an article, "The Theory and Construction of a Rational Heat Motor," in which as a result of special thermodynamic inquiry he developed a mode of working and construction which later received the highest consideration in technical quarters and while his actual working engine developed between 1897-1900 did not realize all of his proposals, it did mark an important step in the development of heat engines, so that today upward of 200 manufacturing companies are building engines operating on the Diesel cycle.

The working process may be carried out in the two-stroke or four-stroke cycle and is as follows:

(a) During the admission stroke atmospheric air only is admitted to the working cylinder, and is then compressed (in actual working engines) to from 30 to 50 atmospheres. The compression space now contains pure atmospheric air of high pressure and temperature which has been produced in a purely mechanical way (compression). Into this space, fuel under great excess of pressure is introduced and Diesel from the first thought of utilizing solid fuel (coal dust), liquid fuel (petroleum, naptha, alcohol), or gaseous fuel (compressed illuminating gas).

(b) Ignition of the fuel is insured by the high temperature of the air at the end of compression. The temperature of ignition has a particular value for each fuel under given conditions, and is lower, the higher the pressure at which the fuel is introduced. Petroleum behaves particularly well in the Diesel Motor and small quantities may be used to start the ignition of heavy tar residues, etc.



(c) Combustion begins immediately after ignition, *the temperature of combustion* is a consequence of the chemical occurrences connected with combustion and depends on the quantity of air present, which *Dicsel uses in great excess* in opposition to the hitherto customary view that in ordinary combustion, the air supply should be but a little more than is just needed for combustion.

(d) The blowing of the fuel into the compression space, already filled with dense air of high temperature occurs during the first portion of the outstroke of the piston, and the rate of fuel supply is regulated so as to maintain constant pressure (approximate) during the period of injection at the close of combustion expansion occurs and was assumed to be adiabatic (which, however, is not the case). Scavenging in the same manner as the gas engine now completes the cycle of operation.

In the first operative Diesel engine tested by Schröter an indicated thermal efficiency of 26% was secured and a brake thermal efficiency (effective work efficiency) of 20%. These efficiencies were far superior to any others attained in heat motors (1897) but have since been very markedly improved (1918).

Fig. V shows the indicaator diagram of Diesel's motor as contrasted with the gas or gasoline engine. Diagrams 1 and

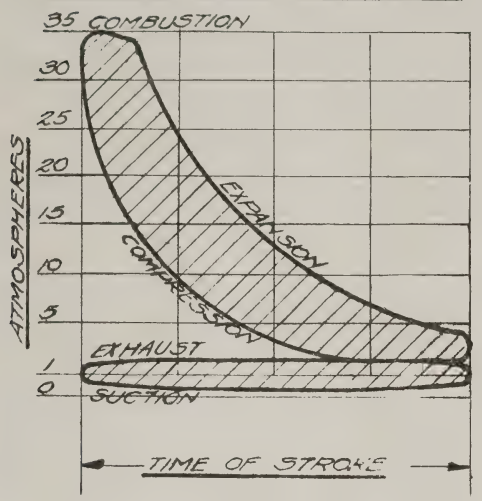
Fig. V A
THEORETICAL DIESEL ENGINE

2 are the theoretical and actual indicators respectively for the Diesel constant pressure engine. Diagrams 3 and 4 are the theoretical and actual indicators of Otto's constant volume gas engine.

While the historical development of the internal combustion engine has been frequently discussed, it is, however, not without interest to review the development following Schlöttler's comparison (*See Die Gas Machine* 1909). The diagram (6) clearly shows at a glance the increase in efficiencies recorded. The years are drawn as abscissae and the efficiencies, based on gas consumption per effective horsepower are drawn as ordinates.

The diagram begins with Lenoir's engine, having an effective work efficiency of 4%. In 1867 the free piston Otto engine was produced, the working indicator diagram of which is shown in Fig. 7. Admission of the combustible mixture take place during the first portion of the outstroke of the piston, ignition and combustion then take place as in Lenoir's engine. This corresponds to late ignition in the modern four-stroke cycle engine, and as is well known is very unfavorable from a point of heat efficiency (since the speed at this point is relatively high the mixture ignites slowly, tending to fail altogether), owing to incomplete combustion and the enormous superficial area of the mixture volume.

Riedler states in published tests that, owing to late ignition the indicated efficiency may drop 50%. The reason lies in the extremely complicated occurrences during combustion. These will be discussed later on in our studies.



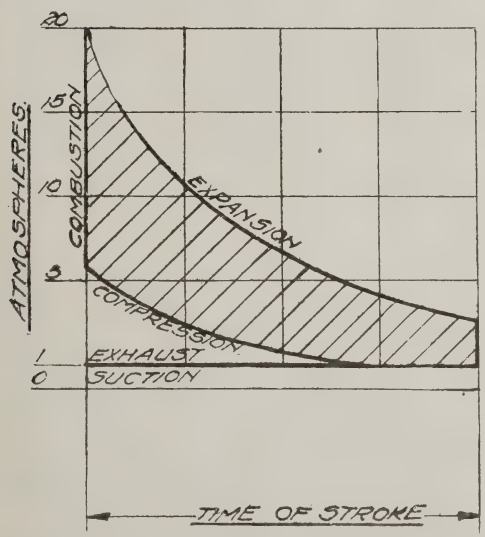
From this point of view the Otto free piston engine possesses no advantage thermo-dynamically, although the expansion ratio is greater, and continue to below atmosphere.

The expansion ratio is approximately equal to

$$E = \left(\frac{Pi}{P2}\right)^{\frac{1}{1.37}} = \text{about } 3.$$

Fig. V B

ACTUAL DIESEL ENGINE



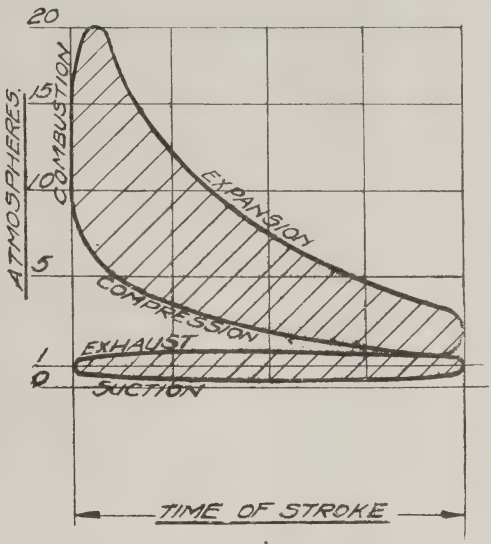
From the end of expansion the piston must impart to the exhaust gases exactly the same amount of energy which they give to the piston during expansion below atmospheric.

Otto's 1867 free piston engine attained about 15% efficiency following with his four-stroke cycle engine, 1876-1878, with about 12% effective.

The next step of importance was Diesel's heat engine of 1897, with 26% effective work efficiency.

Fig. 6 A

THEORETICAL GAS ENGINE (OTTO)

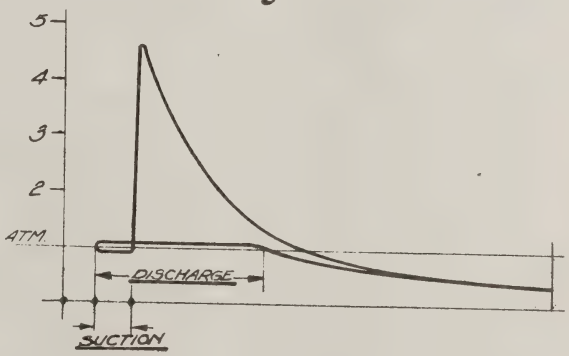


The four-stroke cycle gas engine has been increased in efficiency from 12% in 1878 to 15-19% in 1888 (London Exhibition), operating on illuminating gas. Between 1888-1905 the efficiency was raised to 20-24%. By 1916 we are able to record the extraordinary high efficiency of 34.16% of total heat supplied converted into useful work.

This last result was secured in test by Schröter, Meyer and Dr. Koobor a Gueldner gas engine.

As an interesting contrast it may be said that the *two*-stroke

Fig. 6 B



ACTUAL GAS ENGINE (OTTO)

cycle gas engine has shown equally good results as constructed by Von Occhelhauser and Junkers, with the added remarkable result of 3 times the specific power per unit piston displacement.

The Diesel engine has been constructed in increasing sizes each year, both two- and four-stroke cycle and its efficiency has been increased from 26% (1897) to 37-39% (1918) of total heat supply converted into useful work. At present the United States Government have under construction at Brook-

Fig. 8

OTTO DIAGRAM

FREE PISTON ENGINE

lyn Navy Yard two six-cylinder, two-stroke cycle Diesel engines of 2,500 b.h.p. each for use in submarine tenders.

It is a matter of interest in the comparison to determine the product of the area of the combustion chamber per horsepower, multiplied by the combined times of combustion and expansion. This figure gives an approximation of the amount of heat lost to the walls relative to the amount of heat supplied:

O = area of combustion chamber in M^2 or $(ft)^2$.

H. P. = Horsepower.

Taking the data of Lenoir's engine:

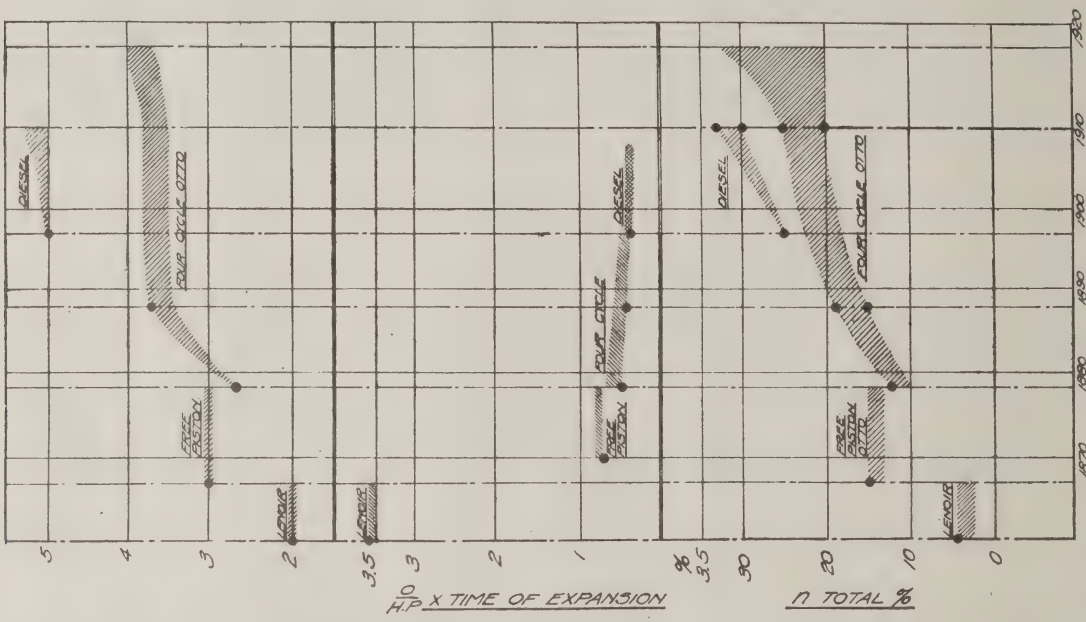
Diameter of cylinder = 160$^m/_m$ (6$^3/_{16}$ inches).
Stroke = 300$^m/_m$ (11$^4/_8$ inches).
B.h.p. = 1.
Speed = 81 r.p.m.
Displacement = 6 litres (366 cubic inches).

The area of the combustion space at the end of expansion 19.2 sq. m. and the ratio:

$$\frac{O}{H.P.} = 19.2 \text{ sq. in.}$$

The time of expansion was 0.185 sec.

$$\frac{O}{H.P.} \times t = 19.2 \times 0.185 = 3.55.$$



The expansion ratio was E = 2.

It is to be observed that increased efficiencies have accompanied increased compression pressures, greater expansion ratios and shorter times of expansion. Of extreme importance are the increases in piston speeds which have obtained during the last fifteen years, as by this means marked improvement in specific capacity, economy, etc., have been obtained. We shall discuss this important subject later on in the technical investigation of the working process of internal combustion engines.

The examination of the physical occurrences, now demands the study of the nature of the fuel utilized, the real process of combustion and of the experimental data on hand concerning it.

Because of the real interest in the Diesel heat motor we shall contrast its development as a constant pressure engine from time to time with the Otto or Clerk constant volume engines.

THE HUGHES AIRCRAFT REPORT

(*Continued from last week*)

FIFTH—SELECTION OF CONTRACTORS AND DISTRIBUTION OF WORK

Selection of Contractors

For engines to be used in training planes, there were orders (to June 30, 1918) for 7,950 OX-5s distributed among the Curtiss Aeroplane and Motor Corporation, the Willys-Morrow and Willys-Overland companies. Orders for the Hall-Scott engines (2,250) were placed with the Nordyke & Marmon Company and the Hall-Scott Motor Company. The General Vehicle Company received an order for 111 Gnome engines (100 H. P.), and the unfilled portio n of this order was taken over by the Aeronautical Engine Company, which also received certain additional orders for engines of the same type, when the latter corporation was organized to conduct operations at the plant of the General Vehicle Company after its purchase by the Government. The Union Switch & Signal Company had orders for 2,500 LeRhone engines (80 H. P.). The orders for the Hispano-Suiza engines placed with the Wright-Martin Aircraft Corporation have already been sufficiently detailed (*ante*, p. 96). In addition, orders for 450 of the Lawrence engine (28 H. P.) were placed with the Excelsior Motor Manufacturing Company, and an order for 2,000 Bugattis was given to the Duesenberg Motor Corporation.

In the Summer and Fall of 1917 contracts were entered into for the manufacture of 22,500 Liberty motors, as follows:

August 31, 1917, Lincoln Motor Company	6,000
September 4, 1917, Packard Motor Car Company	6,000
September 7, 1917, Nordyke & Marmon Company	3,000
September 11, 1917, Trego Motor Corporation	500
November 22, 1917, Ford Motor Company	5,000
December 11, 1917, General Motor Corporation	2,000
Total	22,500

The contract with the Trego Motor Corporation was subsequently cancelled,* only one engine being delivered.

* It is understood that it has been taken over by the Ordnance Department, for tanks. It is cancelled so far as its relation to aircraft is concerned.

For the production of elementary training planes of the type known as the JN4-D, reliance was placed chiefly upon the Curtiss Aeroplane and Motor Corporation which had already made planes for the British Government. Substantial orders were also given to the Springfield Aircraft Company and the Canadian Aeroplane Company, Limited (of Toronto). A number of small orders were placed from time to time with various concerns. The total orders to June 30, 1918, were for 3,975 of the JN4-D type.

The orders for the Standard-J training planes were distributed among the Dayton Wright Aeroplane Company, the Fisher Body Corporation and the Standard corporations (Standard Aero Corporation and Standard Aircraft Corporation). The total orders were for 1,600 of this type.

For advanced training planes, there were orders given to the Curtiss Aeroplane and Motor Corporation (to June 20, 1918), for 919 JN4-H and 479 JN6-H; to the Thomas Morse Aircraft Corporation (for 100

S4-B and 400 S4-C); and to the Breese Aircraft Corporation (for 300 Penguins).

With respect to both elementary and advanced training planes there were also various orders for spare parts.

In service planes, the production of the DeHaviland-4s was pivoted upon the work of the Dayton Wright Aeroplane Company in connection with the designing of the plane for American production, as hereafter explained. There were contracts for 8,500 of the DH-4s as follows:

Dayton Wright Aeroplane Company	4,000
Fisher Body Corporation	4,000
Standard Aircraft Corporation	500
Total	8,500

The contract for the Bristol Fighters (2,000) was given to the Curtiss Aeroplane and Motor Corporation.

In view of the exigency, it was inevitable that the responsible officials of the Signal Corps entrusted with the duty of aircraft production should exercise a broad authority, virtually unhampered by restrictions, in the selection of contractors. The Aircraft Board, in which the responsible Army officers sat as members, afforded a useful opportunity for the comparison of views, but not a legal, and only to a limited extent a practical, check. There have been numerous complaints from individuals and corporations who sought contracts unsuccessfully. The extent to which activities were centered at Dayton, the profitable contract promptly given to Colonel Deeds' former business associates, and the preference of a small group of manufacturers in the allotment of the large contracts, created a feeling of distrust which finds frequent expression in the record of this inquiry.

There could be no well founded objection to a well-directed effort to standardize products for production in large quantities under conditions favoring the most economical and efficient work. So far as orders for production of planes in small quantities and various spare parts are concerned, to give an adequate statement of the facts with respect to the companies who received, or which asked and were refused, contracts would require a great variety of detail which it is impracticable to set forth. It does not appear that in the award of these contracts there was adherence to any clearly-defined principle. It is sufficient to say that in many instances the parties complaining have no ground for their complaints, save that others in no better situation obtained what the complainants were denied. For while offers or requests of some manufacturers went unheeded because of alleged lack of proper facilities or of assured financial ability, in other cases contracts were made with parties equally destitute of adequate resources. Among those whose facilities were apparently adequate, some were taken and others were left.

But aside from any question of discrimination between manufacturers, it is obvious that the exigency demanded that important and needed sources of supply should not be neglected, and in this connection, without attempting to make a comprehensive statement of other available resources, the case of the Singer Manufacturing Company deserves special attention.

Singer Manufacturing Company

While this Company had no experience in the building of aeroplanes, it had perhaps the largest plant in the country for cabinet work, and one of the largest veneer plants, and its facilities available for the processes demanded in aircraft production were hardly excelled in the country. As Colonel Waldon testifies, "There was every reason why they should be successful in aeroplane manufacture." The officers of the Company were not seeking contracts but they offered its facilities to the Government and these were not utilized. As early as July 14, 1917, Mr. Waldon of the Aircraft Production Board requested an interview with the vice-president of the Singer Sewing Machine Company, and this was had. Later, representatives of the Singer Company visited the plants of the Curtiss Company, the Dayton Wright Company and the Canadian Aeroplanes, Ltd., of Toronto, and an interview was then had with Mr. Deeds and Mr. Waldon, on August 14. Up to that time, the manufacture by the Singer Company of 3,000 training planes had been under consideration, but it was then suggested that it should build 1,000 service planes of the DeH-4 type. Before undertaking this work, the representatives of the Singer Company desired to examine the sample DeH-4 at the plant of the Dayton Wright Aeroplane Co. The letter of introduction to that company, however, revealed the fact that the whole proposition was still very indefinite. The letter (August 15, 1917) stated:

"We are asking the Singer Sewing Machine Co. to conduct such investigations as is possible while we are making up our minds as to the part of our program they are to fulfill. When they were here yesterday we suggested that they should help in the DH-4 production. This is not definitely settled, and they may be given some other part of the program, but we would like to have them given the privilege of an opportunity to study the details of the DH-4, inasmuch as it represents the latest type of barge war machine from abroad."

On receiving this letter, the Vice-President of the Singer Company telegraphed Mr. Waldon that it was so indefinite that the trip would be postponed until it was decided whether it was desired that they should undertake the building of the DeH-4. To this Mr. Waldon replied, under date of August 16, as follows:

"We are promptly in receipt of your telegram about the indefiniteness of our letter of August 15th. Since your visit we have received a cablegram which indicates that there will be a very important change in our program, in all probability causing us to change the type of machine you would build. This was the reason I stated in my answer that it was not definitely settled that you would build the DH-4. It will be in your hands, however, whether you go to Dayton and look over the DH-4 as a sample of an up-to-date war machine. The one we have in mind now that we would ask your assistance upon would be quite a little larger than this."

On August 17, Mr. Waldon telegraphed "change in program will probably make it necessary to assign a type other than DH-4." On August 20, the Singer Company informed Mr. Waldon that they had decided to postpone their trip to Dayton "until it is more definitely settled what you wish us to do for you." In a postscript to this letter it was stated that the Singer Company had been requested by the British Government to duplicate their order from that Government for certain aeroplane parts (universal joints), and they asked whether there was any objection to their undertaking this additional work. An answer was received on August 23, that this was entirely satisfactory. This additional work for the British Government required the services of perhaps 100 persons, and left the Singer Company quite free to undertake the making of planes for the Government, but no further word was received and no order was given to the Singer Company. In the light of the correspondence, no explanation has been given of the failure to enlist its important resources for the purpose of aircraft production.

Engel Aircraft Company, of Niles, Ohio

In view of the former connection of Mr. Harry E. Baker, the brother of the Secretary of War, with the Engel Aircraft Company, the facts with respect to its organization and its contracts with the Government should be set forth.

The Company was organized about August, 1917, under the laws of Ohio. Mr. Harry E. Baker testifies that it was originally intended to have a capital stock of $3,000,000 (preferred $1,000,000 and common $2,000,000), but this was subsequently reduced to $1,500,000 (preferred $500,000 and common $1,000,000). Mr. Harry E. Baker, of Cleveland, was President and general manager. His associates in the organization of the Company were Mr. Engel, Vice-President and production manager, and Mr. Patterson, Secretary and Treasurer.

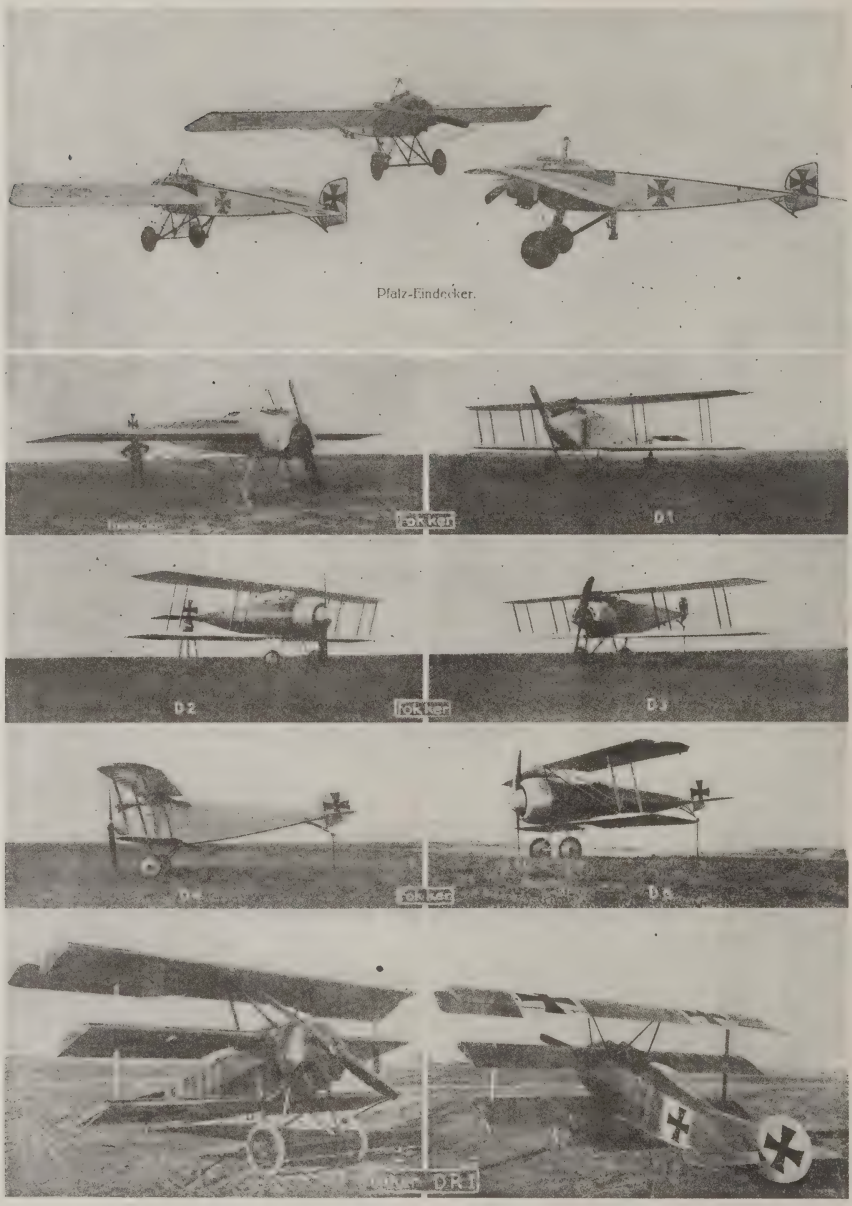
Mr. Baker had taken an option in the Spring of 1917 for the plant at Niles, Ohio, formerly owned by the Engel Aeroplane & Motor Co., and this was taken over by the new Company, which, in effect, issued its preferred stock therefor, at a cost of about $225,000. The remainder of the preferred stock was sold for cash. The preferred stock was entitled to seven per cent. cumulative dividends and, as Mr. Baker states, was to be retired at par before the common stock participated in earnings. The common stock was issued to Mr. Baker and his associates for services in promotion. As an officer of the company, Mr. Baker received a salary at the rate of $7,000 a year.

On October 9, 1917, the Aircraft Board recommended that an order be placed with the Engel Aircraft Company for spare parts for 100 JN4-D training planes, at the aggregate price of $80,827.80. At the meeting of the Aircraft Board on October 19, 1917 it was recited that the Equipment Division had recommended that a larger order be placed with the Engel Company, and the Board thereupon rescinded its resolution of October 9, and recommended that an order be placed with the Engel Company for spare parts for 700 JN4-D aeroplanes at a total cost of $585,077.50. Following this contract for 700 sets, Mr. Baker states that there were further orders from the Government during his connection with the Company for 200 sets of spares for JN4-Ds, 200 sets of spares for JN4-Hs, and another order of 100 sets of spares for JN4-Ds, the aggregate orders being for 1,200 sets of spares at a price of about $1,000,000. Mr. Baker testifies that he ceased his connection with the Engel Company on January 21, 1918.

The Secretary of War testifies that either before or after our entry into the War his brother (Harry E. Baker) asked him whether there was any reason why he should not go into the manufacture of a certain flying boat for the Navy, in association with one Engel. The Secretary told him that he knew of no reason why he should not. Later his brother informed the Secretary casually that they were going to make aeroplanes, and asked if the Secretary objected. The Secretary replied that he had no right to object, but did not wish to be consulted about it; that he had nothing to do with it. Later, the Secretary discovered that the Engel Aircraft Company, of which his brother was president, had a contract with the Government, which was not a competitive contract, but one which had been given upon an inspection of the facilities of the aircraft company. The Secretary sent for General Squier and asked for the facts. The Secretary regarded the situation as intolerable and directed that the contract should be cancelled. Thereupon it was immediately cancelled by telegraph and arrangements were made, through Mr. Eugene Meyer, Jr., (acting for the Secretary) for the separation of Mr. Harry E. Baker from the Company. The Secretary thought it was just that his brother should be paid on the basis of the value of any services he had rendered, but that his complete separation from the Company was necessary before a contract should be regarded as possible.

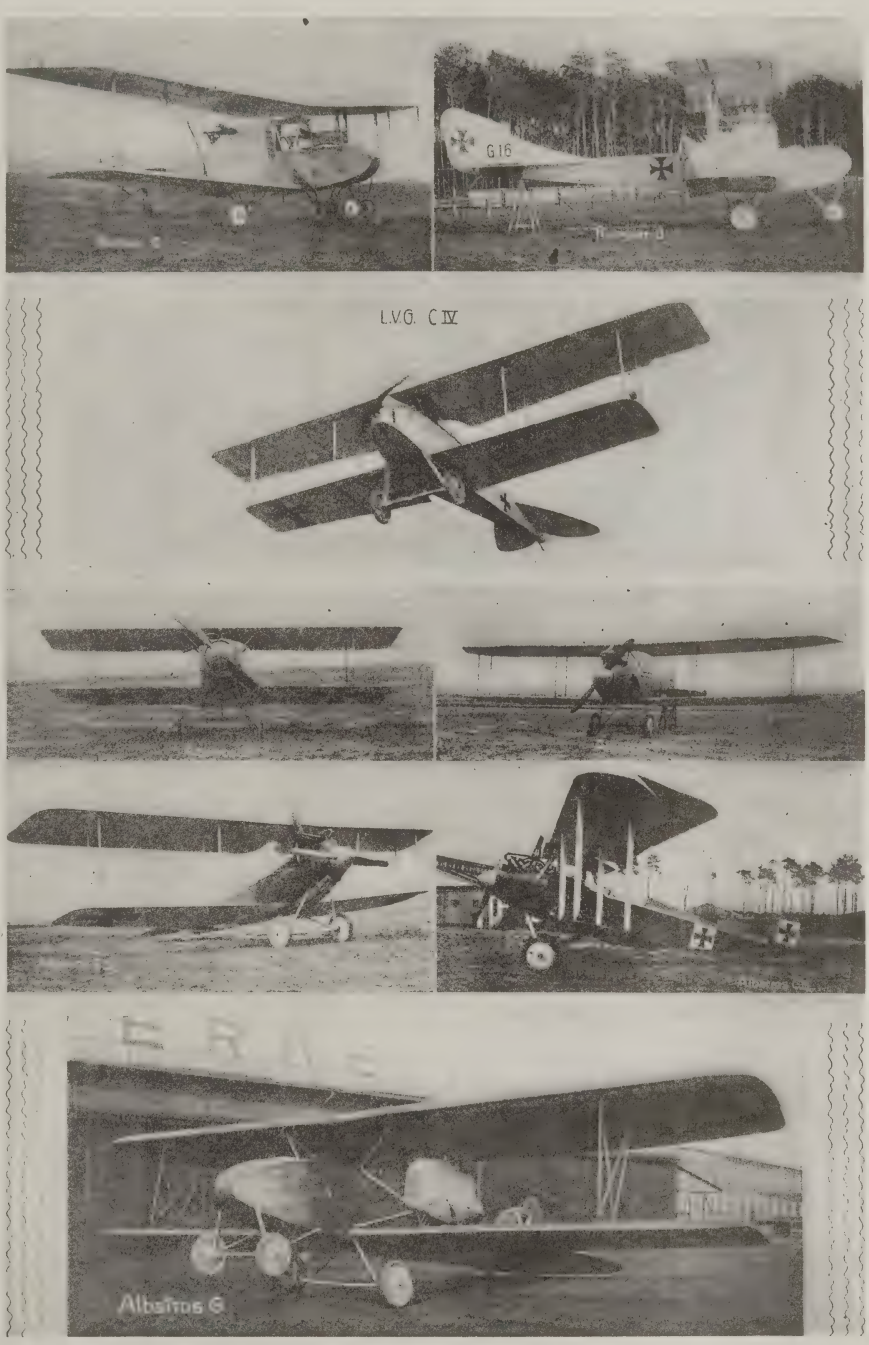
Mr. Harry E. Baker testifies that, in January last, he was informed by telephone that all of the contracts of the Engel Company had been cancelled: that he immediately went to Washington and had an interview with Assistant Secretary of War Crowell, who told him that his association with the aircraft business was embarrassing to the Secretary of War, and that he should retire from it. He said that he had no desire to furnish cause for embarrassment, and accordingly, after an interview with Mr. Meyer, he turned back to the Treasurer of the Company all of the stock that he had in his name and resigned as President and general manager. Mr. Baker testifies that the Company paid him nothing for his stock. In addition to the payments of salary which, according to his testimony, he had received for two months at the rate of $7,000 a year, Mr. Baker says that he was paid on his retirement the sum of $15,000 in consideration of the services that he had rendered.

Being assured that the separation of his brother from the Company had been effected, the Secretary notified General Squier that the capacity and merits of the Company were the only matters to be considered. All the contracts were immediately reinstated on the same terms. Subsequently an additional order was given to the Engel Company for 500 sets of spares for DeHaviland-4s, at an estimated cost of $2,275,000.



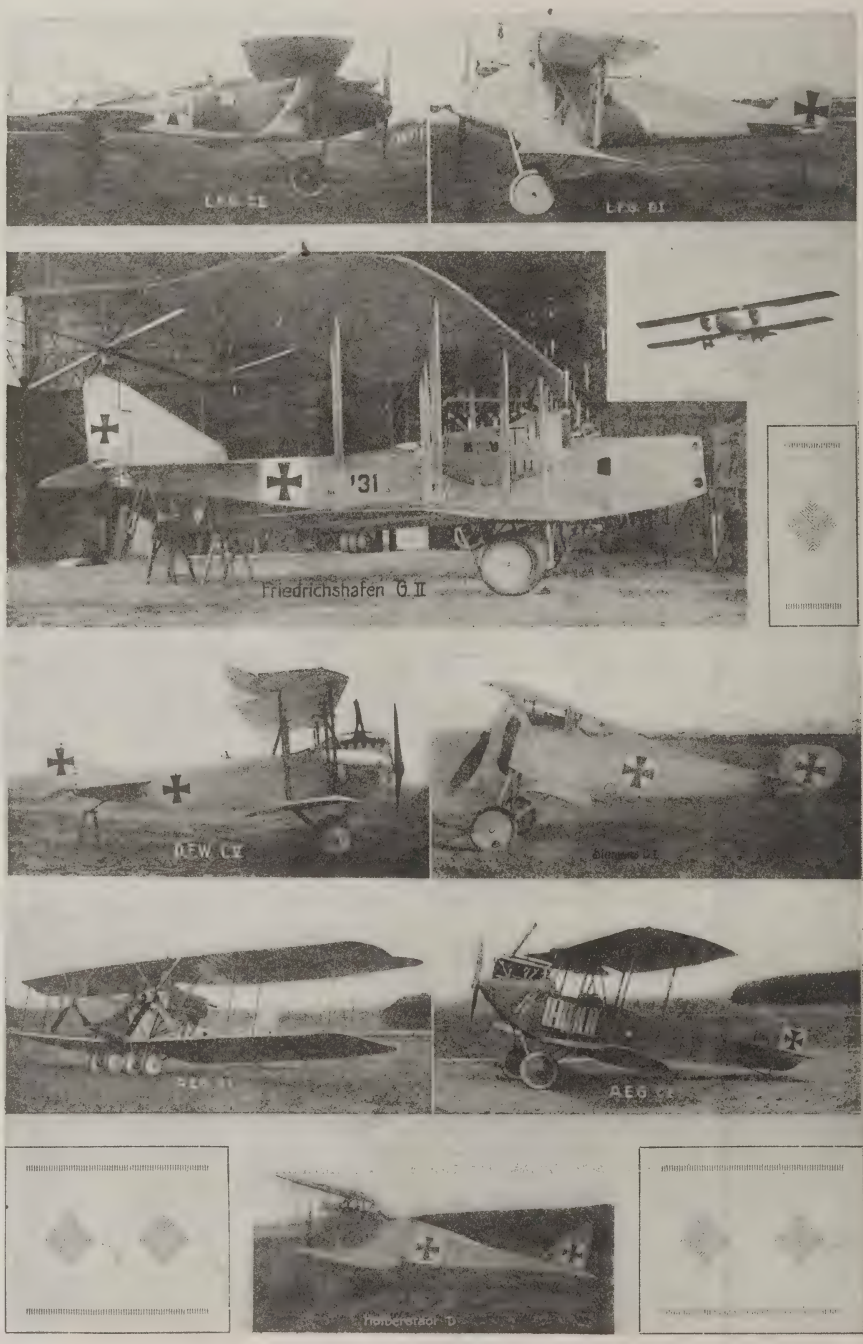
Distribution of Work

Quite as important as the selection of contractors and the development of adequate sources of supply, was the distribution of work so as to insure prompt and efficient production. Each type of plane requires special preparation and the demands of varied sorts of work may easily be mutually restrictive and demoralizing. A conspicuous instance of this is furnished in the case of the Standard Aircraft Corporation. This Company with its predecessor (the Standard Aero Corporation) had the unusual features of being a manufacturing corporation under the direction of two lawyers, Harry Bowers Mingle and Max J. Finklestein, of the firm of Mingle and Finklestein, of New York City. It is unnecessary to review the financial history of the two Standard corporations, with their plants at Elizabeth and Plainfield, New Jersey. It is sufficient for the present purpose to say that from the time of the organization of the Standard Aircraft Corporation in November, 1917, it has been the operating company, except that recently the Standard Aero Corporation has been availed of, and it has taken the plant at Plainfield for the purpose of handling fixed-price orders, the cost-plus contracts being in course of performance at the large plant at Elizabeth. Both these corporations are controlled by Mitsui & Company, a leading Japanese firm, which holds all the preferred stock and a majority of the common stock of each Company. The orders which have been given by our Government to one or the other of these Standard companies exhibit an extraordinary range of types embracing training planes of the Standard-J type, six machines and spares of the JR-1B type for the Post Office, advanced training planes of the M-Defense type, four Capronis, the assembly of Handley-Page planes, five hundred DeHaviland-4s, as well as flying boats for the Navy and various orders for small parts. The effect was to put in this plant almost every variety of aeroplane work, a proceeding which has no justification from a production standpoint. Mr. Charles H. Day, the chief engineer of the standard companies, whose ability is generally recognized, frankly admits the serious disadvantage of this multiplicity of orders. He says:

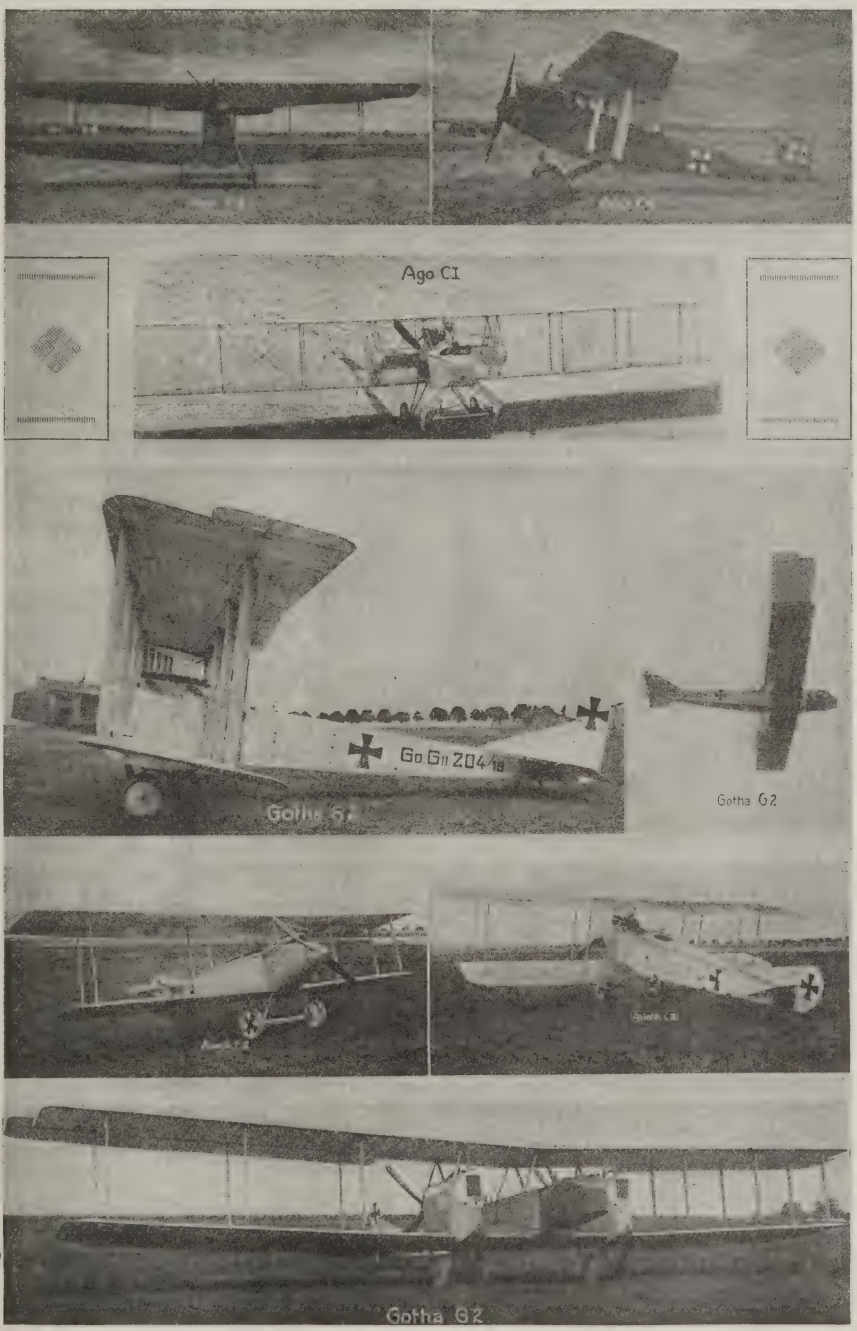


(*Continued on page 575*)

REVIEW OF GERMAN AEROPLANES, SHOWING EVIDENCE THAT THE GERMANS COPIED FRENCH AND BRITISH AEROPLANES THROUGHOUT THE PERIOD OF THE WAR



The Fokker monoplane was built on the Morane-Saulnier design; the Fokker biplanes were built on the Sopwith and Nieuport designs; the triplane on the Sopwith design. Aerial Age published the designs of most of the machines shown herewith and of the larger model.



These photos show the German Rumplers, the L. V. G. and the Albatros, single and double motors

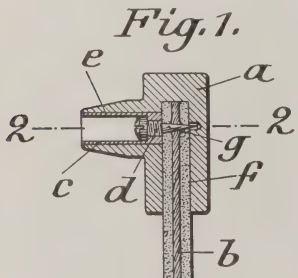
The L. F. G. were the only German machines with original features, but they stole the "wireless" features of later models from Curtiss

The Gothas, the Aviatiks and the Ago are shown herewith. The designs of the four-motor Zeppelin type German bomber were published in a recent number

SPLITDORF AND THE MAGNETO SITUATION

THE Federal Trade Commission having granted Splitdorf Electrical Company of Newark, N. J., a license under certain Bosch patents, various conflicting notices have appeared in the press concerning the matter.

With a view to obtaining a correct statement concerning the mater, C. W. Curtiss, General Manager of the Splitdorf Electrical Company, was interviewed and made the following statement:



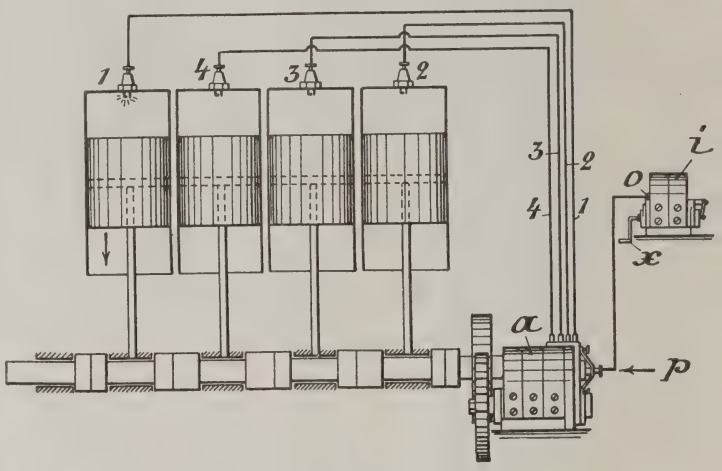
"It is true that Splitdorf Electrical Company has been granted a license by the Federal Trade Commission to use two United States patents owned by Robert Bosch of Stuttgart, Germany. I do not believe these patents have been used to any extent by the Bosch Magneto Company of Springfield, Mass.

"Splitdorf Electrical Company was ordered to make use of these patents by the Secretary of War at the direction of the President of the United States in connection with magnetos for war aeroplane purposes. The patents do not relate in the remotest degree to the principle of construction embodied in the Dixie magneto, which is made under numerous United States and foreign patents owned or operated under by the Splitdorf Electrical Company only.

"The Bosch patents in question relate merely to details, standard practice abroad, which the Government authorities wanted for the following reasons:

"Patent 1030817 relates to a binding post for connecting electric cables. This is a detail of construction commonly used abroad and with which European aviators and mechanics are familiar. Naturally by incorporating this detail in the Dixie magneto, cables on foreign magnetos would then readily interchange with the American product, and probably for this reason Splitdorf Electrical Company was instructed to use this patent. There are many other ways of attaching a cable to a magneto and some of them covered by Splitdorf patent applications pending may even be preferable to the one shown in the patent, but as this was already being used abroad, it was adopted as standard here. The accompanying figure taken from this patent shows the Bosch type of

Fig. 1.



binding post employing a pointed screw piercing the conductor and securing it in place in the insulated brush holder or distributor.

"Patent 1014824 relates to an ignition system, wherein a high tension starting magneto is connected to the main magneto in such a way that the starting magneto may be operated by hand in order to furnish a starting spark. The accompanying figure from patent 1014824 shows this arrangement.

"The main magneto 'A' is connected to

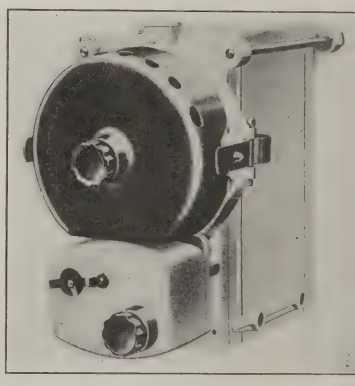


Fig. 1.

the spark plugs in the usual manner. From the distributor of the main magneto a cable 'P' is connected to the starting magneto 'I' and when the latter is rotated by means of the crank 'X' high tension current will flow into the distributor of the main magneto where it is distributed by means of an auxiliary brush located behind the usual moving brush of the distributor, thereby being connected to whatever cylinder is under compression, and in no way relating to or interfering with the functioning of the main magneto. As soon as the engine has started, the service magneto 'A' operates in the usual manner, the hand starting magneto 'I' being stopped. This arrangement of using a hand starting magneto is standard on many foreign aeroplane engines, and it was desired to have the American practice conform for the sake of uniformity. There are several other ways of accomplishing the same results, and this patent is not vitally essential to American needs, although its use is desirable for the reason stated.

"An improved method is shown in U. S. patent 1260995, property of the Splitdorf Electrical Company, by which method the high tension wiring to the starting magneto is eliminated and the arrangement simplified as compared to the Bosch patent. Splitdorf Electrical Company has manufactured several hundred thousand magnetos for the Allies since the beginning of the war, and its product is now 100% essential. The Dixie magneto has been standardized and is being produced in great quantities to meet the present emergency, the Splitdorf Electrical Company now being the largest manufacturer of magnetos in this country.

"In addition to furnishing magnetos direct from their own factory for war purposes, the Splitdorf Electrical Company has arranged to permit the Bosch Magneto Company of Springfield, Mass., and the Ericsson Manufacturing Company of Buffalo, N. Y., manufacturers of the Berling Magneto, to make for war purposes only, and only for the duration of the war, certain Dixie magnetos under the Splitdorf Dixie patents; therefore three sources of supply for the Dixie magneto are available. In addition the Splitdorf Company will furnish the necessary drawings and engineering information so that the product of all three factories will be standard, uniform and interchangeable.

"The standardized Dixie magneto enables one magneto to be used for 4, 6, 8, 12, and 16-cylinder engines, and 8 and 12, 45 degree cylinders, with a total of only 16 extra pieces to make up any one of the necessary assemblies. This arrangement, devised and developed under the direction of the Splitdorf Company's Engineer, Carl T. Mason, eliminates the necessity of having several types of magnetos and hundreds of repair parts therefore at the supply depots, and marks not only a distinct advance in the art, but is a notable example of an all American contribution to winning the war."

FRED S. DUESENBERG, PIONEER HIGH DUTY ENGINE BUILDER

SEVENTEEN years ago, in a tiny garage and repair shop in Rockford, Iowa, was born the idea which has reached maturity in the Duesenberg marine motor of today. Here it was that Fred S. Duesenberg built the first gasoline motor, a clumsy little motor-cycle engine which was exhibited at the first Chicago show. Even in these formative days the motor gave promise of a budding genius in design which has been fully realized.

Catching a glimpse of the tremendous future of the automobile industry, Fred S. Duesenberg organized the Mason Motor Co., of Des Moines, Iowa, and spent a few years bringing out what was in those days, a first class machine. But this kind of thing didn't keep Fred S busy enough, so in 1910 he branched out into the automobile racing game, as it seemed to offer the greatest field for the development of ideas and rapid and severe trial of their value. The first four-cylinder Duesenberg engine was built mostly in the basement of the Duesenberg home and took over a year to complete. However, it was a real motor and embodied improvements which have endured the rigors of many racing campaigns without a reason for any important change. This original motor was still propelling a car with a truck body on it at 50 miles an hour through the outlying districts of Chicago this summer. Fred Duesenberg entered his first car in Indianapolis Race of 1912 and was scoffed at for doing so, as his motor capacity was only 230 cubic inches as against the 450 cubic inches of the other cars. However, he got 78 m.p.h. out of the car in that race and eventually forced the abandonment of the 231 cubic inch class races.

The success of the Duesenberg racing motor since then has been so outstanding that practically everybody knows the principal details. It is probably safe to say that at least 70 per cent of all cars on the dirt and board tracks today in America are Duesenberg equipped.

Development of the gasoline motor for marine purposes has gone hand in hand with its perfecting in the automobile field and when a prominent Chicago sportsman determined to do a seemingly impossible thing—produce a sixty-mile boat—it was natural for him to turn to Fred Duesenberg to produce the power plant for him. The problem was a tough one, but five months from the day the motor was first put on paper the engines were turning over in Disturber IV, the fastest 40-foot hydroplane yet developed in this country.

Fred S. Duesenberg

That was the start of the Duesenberg marine engine. Soon after the successful results obtained in the Disturber the old Loew-Victor Engine Co., of Chicago, made a deal with Fred Duesenberg to become their chief engineer. He designed for them a six-cylinder and an eight-cylinder 6¾ inch by 7¾-inch marine engine. He also designed a four-cylinder aeroplane engine, a six-cylinder aeroplane engine and a series of automobile motors.

In January, 1917, the Duesenberg Motors Corporation was formed, taking over the old Loew-Victor Engine Company and in the fall of 1917 they moved into the big modern factory at Elizabeth, N. J. The Loew-Victor plant in Chicago and the temporary Duesenberg factory at Edgewater, N. J., were brought together in this new factory at Elizabeth, and subsequently, in order to obtain sufficient facilities to execute large Government contracts for aeroplane motors, the Duesenberg Motors Corporation purchased the plant of the F. I. A. T. Automobile Company, of Poughkeepsie, N. Y., which was also moved into the new factory at Elizabeth, which had been doubled in size by the construction of an additional unit.

In February, 1918, ground was broken for a separate factory unit solely for testing and laboratory purposes and in May this building was completed and is said to be the largest permanent gasoline engine test house in existence.

Thus from comparative obscurity Mr. Duesenberg through sheer mechanical ability has risen to be one of the leading figures in the automotive industry today.

(*Continued from page* 569)

"There is a natural amount of confusion in having a multiplicity of those parts. . . . The engineering personnel is limited by the number of different machines you have to produce, and the executive force is limited by the same amount. The physical layout of the factory itself is very seriously affected. . . . We have on the HS boat job, made entirely our own drawings. It was out of the question to work to the drawings which were supplied us and we therefore redrew the entire job. That occupied a great amount of time of the drafting room and the engineering departments of the Standard Aircraft. Then a great amount of drawing has been necessary on the DeHaviland-4, it being impossible to get VanDyke drawings from the Signal Corps, and we have attempted to draw up a great deal of that machine, and we have redrawn in its entirety the Handley Page machine. That involves the engineering department and the drafting department and the bill of materials department, sometimes known as the specification department, which is one of the most important we have, inasmuch as under the present regulations we are not allowed to purchase material except we bill the material. The approvals officer will not approve the materials except on the basis of a bill of materials supplied, and making the bills of materials and completing the drawings on all these different machines has been extremely difficult.

"Q. Have you had in your drawing department the HS boats for the Navy, that is the seaplane, the Handley-Page planes and the DeHaviland planes, all being worked out at the same time? A. Yes, sir."

On the same point, Mr. Day again testified:

"The order for the DeHaviland-4s is a very small order comparatively. . . . If we were to turn over our plant entirely into building the 500 DeHaviland-4s and had a go-ahead on 500 DeHaviland-4s, it would not last very long. We expected early in this year and were preparing to take over a large order for Capronis. That was before we had the DeHaviland machines, and it was supposedly to be a thousand Capronis. That was a fair sized order, and we expected we would have that alone and nothing else. But that was withdrawn, and the order for 700 sets of spare parts for the Bristol and 1,500 sets of spare parts for the DeHaviland-9 was given us, and that was a pretty fair sized order. That in itself would have been difficult for some length of time, but both of those orders were recalled. The interference, so far as spare parts of machines is concerned, would have been less than the interference caused by two orders for complete machines. It has been impossible for us to obtain a large enough continued order to actually know what we were going to do and to prepare for doing it."

Criticisms upon the management of the corporation do not excuse such a state of affairs. If a manufacturing corporation is to be entrusted with work, it is manifest that it should be given the work it can handle efficiently; and if its efficiency is distrusted, there is still less reason for embarrassing it with confusing orders. On the other hand, if it is deemed capable of successful production it should have a suitable opportunity to develop it. The effect of placing such an assortment of orders, coupled with the difficulties besetting production in this new industry, has not only interfered with production, but has promoted waste, made it exceedingly difficult to maintain proper cost accounts, and has confused responsibility for delays.

Other illustrations of a poor distribution of work might easily be given; the result of it is that one part of the Government's program has stood in the way of another.

MILITARY AEROSTATICS

HOW it feels to be in a run-away Caquot observation balloon, torn from its winch by a wind storm and blown 9,000 feet over the Cascade Mountains, is told by Lieutenant H. C. Hahlbeck, an observer attached to the Army Balloon School at Arcadia, California. The observer stuck to his balloon until hope of saving it was gone and then made a parachute jump to safety. While it was not necessary that there be a passenger in the basket, on the afternoon of his adventure he had ascended as additional ballast in the balloon for some experimental work and had not adjusted his parachute harness and carried only four bags of sand ballast.

In the official report of the incident Lieutenant Hahlbeck stated that when the cable broke he was riding 2,500 feet in the air, and while he noticed a storm brewing in the distant mountains, he did not report it to the crew at the winch below until gusts at 30 to 40 miles an hour were jerking the balloon and causing it to roll so that the basket at times was at an angle of 45 degrees or more from the perpendicular.

In his report Lieutenant Hahlbeck described what happened as follows:

"I telephoned down, describing the wind force, and directed that the balloon be hauled down. I also asked that as many men as could be found be assembled, as I figured there would be trouble in handling the balloon on the ground. The wind became rapidly worse on my descent. At 500 feet elevation the balloon was in the teeth of the gale. I saw by the pitching and rolling that I was in trouble and started to adjust my parachute harness immediately, but it was slow work on account of the behavior of the basket.

"The balloon in the meantime was being maneuvered by the crew below west, past the guard house over the main road past the K. of C. hall, north over the road past the rigging tent and then east past the rigging tent, the winch stopping on the main road in front of the balloon hangar on the west side of the road; wind blowing forty to fifty miles per hour in southwest direction. There the winch started to haul down, but the balloon pitched considerably, each time straightening up with a jerk and putting a severe strain on the winch cable. When about one hundred feet from the ground a severe gust of wind hit the nose of the balloon, causing it to pitch much heavier than previously and straightened up and snapping the cable just above the sheave wheel.

"The balloon, being free, ascended rapidly to about nine to ten thousand feet, according to my estimate of the height above the mountains north of the camp. The monometer tube bubbled over. I previously had grabbed the valve cord immediately on the balloon breaking away and kept the valve open almost continually on my ascent, as the balloon became as tight as a drum and I feared it would burst. I held on to the valve cord with both hands, finally fastening it to one of the basket toggles, and then hunted for the altometer, finding it on the bottom of the basket in between the sand bags, it having snapped off when the balloon broke away. I fastened it to the suspension bar and it was then registering about 7,000 feet and coming down rapidly. I then looked at the territory around me, could see far over the tops of the mountains north of the camp and got my position as above San Gabriel, rapidly going southwest toward the ocean. The ocean appeared a great deal nearer than it actually was, due to my height. Meantime I had closed the valve, as I noticed the fins and tail were hanging loosely at the rear of the basket, and seeing the balloon almost two-thirds empty, realized I had valved it too much. It was then coming down too fast for safety, descending four thousand feet in about two minutes time, and I decided to jump, leaving the sand bags in the basket, as I thought possibly the balloon might be carried over to the ocean. Then, to make doubly sure of the balloon hanging in a large field, which I was approaching, I again decided to rip the balloon, leaving sand bags in as ballast so that the balloon would descend in the field and not be lost. I knew it would be foolhardy to say in the basket and throw the sand bags out because of the small amount of gas in the balloon. I ripped he balloon and vauled over the side of the basket, taking care to adjust all the straps of my harness before ripping and looking to see which was the correct side to jump from.

"I landed safely in a tomato patch on the north side of the field I had in mind, landing backward on my heels, turning a complete somersault over onto my feet again, and then running to the parachute, holding the edges down before the wind could open it and drag me. I then unfastened the hooks on my harness and rolled up the parachute in time to give it to the ambua scratch or a bruise. The baloon was carried over the field I had in mind into a wash borderlance driver as he came out. I landed without ing the west side of it, landing on some barb wire."

A Caquot observation balloon ascending for observation of artillery fire

NAVAL and MILITARY AERONAUTICS

Key to Abbreviations

AAD—Assigned to active duty.
ABC—Report to Army Balloon School, Arcadia, Cal.
ABC—Report to Army Balloon School, Arcadia, Cal.
ADO—Report to Aviation Supply Depot, Dayton, Ohio.
ADT—Report to Aviation Supply Depot, Dallas, Texas.
AFO—Report to Aviation Supply Depot, Fairfield, O.
AGC—Report to Aviation Supply Depot, Garden City, L. I., N. Y.
AHT—Report to Aerial Gunnery School, Houston, Texas.
AIR—Transferred to the Air Service, National Army, without change in rank or date of commission.
ALF—Report to Camp Alfred Vail, Little Silver, N. J.
AMV—Report to Aviation General Supply Depot, Morrison, Va.
AOV—Report to School for Aerial Observers, Hampton, Va.
APR—Report to School of Aerial Photography, Rochester, N. Y.
ARV—Report to Aviation Supply Depot, Richmond, Va.
ASM—Report to Aviation Mechanics' Training School, St. Paul, Minn.
BFT—Report to Barron Field, Fort Worth, Texas.
BRN—Report to Bakers Field, Rochester, N. Y.
BST—Report to Brooks Field, San Antonio, Tex.
CAF—Report to Carlstrom Field, Arcadia, Fla.
CAP—Commissioned as Captain, Aviation Section, Signal Corps.
CDT—Report to Aviation Concentration Camp, Dallas, Texas.
CFT—Report to Carruthers Field, Fort Worth, Texas.
CGC—Report to Aviation Concentration Camp, Garden City, L. I., N. Y.
CGS—Report to Aviation Concentration Camp, Greenville, S. C.
CIT—Report to Radio School, Carnegie Institute of Technology, Pittsburgh, Pa.
CJS—Report to Camp Jackson, Columbia, S. C.
CJW—Report to Camp John Wise, San Antonio, Texas.
CLR—Commissioned as Colonel, Aviation Section, Signal Reserve Corps.
CMV—Report to Aviation Concentration Camp, Morrison, Va.
CPA—Commissioned as Captain Air Service, National Army.
CPR—Commissioned as Captain, Aviation Section, Signal Reserve Corps.
CRI—Report to Chanute Field, Rantoul, Ill.
CSO—Report to the Chief Signal Officer, Washington, D. C.
CUI—Report to School of Military Aeronautics, Cornell University, Ithaca, N. Y.
CWT—Report to Call Field, Wichita Falls, Texas
DAF—Report to Dorr Field, Arcadia, Fla.
DAP—Report to Director of Aircraft Production, Washington, D. C.
DIK—Report to Camp Dick, Dallas, Tex.
DIS—Honorably discharged from service.
DMA—Report to Director of MilitaryAeronautics, Washington, D. C.
ELA—Report to Eberts Field, Loanoke, Ark.
EOT—Report to Ellington Field, Olcott, Texas.
FLA—Commissioned as First Lieutenant Air Service, National Army.
FLR—Commissioned as First Lieutenant, Aviation Section, Signal Reserve Corps.
FLT—Commissioned as First Lieutenant, Aviation Section, Signal Corps.
FOB—Report to Fort Omaha Balloon School, Omaha, Neb.
FRF—On duty requiring regular and frequent aerial flights.
FSO—Report to Fort Sill School for Aerial Observers, Fort Sill, Okla.
GIT—Report to School of Military Aeronautics, Georgia Institute of Technology, Augusta, Ga.
GLC—Report to Gerstner Field, Lake Charles, La.
HHN—Report to Hazelhurst Field, Mineola, L. I., N. Y.
JMA—Rated as Junior Military Aviator.
JRC—Report to Jackson Field, Riverside, Cal.
KST—Report to Kelly Field, So. San Antonio, Tex. (When specified in the order, the number of the field is given in parentheses)
LDT—Report to Love Field, Dallas, Tex.
LHV—Report to Langley Field, Hampton, Va.
MAC—Report to March Field, Allesandro, Cal.
MAJ—Commissioned as Major, Aviation Section, Signal Corps.
MAT—Report to Mather Field, Sacramento, Cal.
MDO—Report to McCook Field, Dayton, Ohio.
MIA—Report to U. S. Naval Air Station, Miami, Fla.
MIT—Report to School of Military Aeronautics, Massachusetts Institute of Technology, Boston, Mass.
MJA—Commissioned as Major Air Service, National Army.
MJR—Commissioned as Major, Aviation Section, Signal Reserve Corps.
MSC—Report to Radio School, Maryland State Agricultural College, College Park, Md.
OBS—Attached to the Aeronautical Service as Observers.
OSU—Report to School of Military Aeronautics, Ohio State University, Columbus, Ohio.
PFO—Report to Post Field, Fort Sill, Okla.
PMT—Report to Park Field, Millington, Tenn.
PUP—Report to School of Military Aeronautics, Princeton University, Princeton, N. J.
PWM—Report to Payne Field, West Point, Miss.
REL—Relieved from present duty.
RSD—Report to Rockwell Field, San Diego, Cal.
RTR—Retransferred to organization attached to previous assignment to aviation duty.
RWT—Report to Rich Field, Waco, Tex.
SBI—Report to Scott Field, Belleville, Ill.
SAG—Report to Souther Field, Americus, Ga.
SGS—Report to Camp Sevier, Greenville, S. C.
SLA—Commissioned as Second Lieutenant Air Service, National Army.
SLR—Commissioned as Second Lieutenant, Aviation Section, Signal Reserve Corps.
SLT—Commissioned as Second Lieutenant, Aviation Section, Signal Corps.
SMA—Report to School of Military Aeronautics, Cambridge, Mass.
SMM—Report to Selfridge Field, Mount Clemens, Mich.
SRC—Report to Columbia School for Radio Officers, New York City.
TFT—Report to Taliaferro Field, Fort Worth, Texas. (When specified in the order, the number of the field is given in parentheses)
TMA—Report to Taylor Field, Montgomery, Ala.
UCB—Report to School of Military Aeronautics, University of California, Berkeley, Cal.
UIU—Report to School of Military Aeronautics, University of Illinois, Urbana, Ill.
UTA—Report to School of Military Aeronautics, University of Texas, Austin, Tex.
VBW—Report to Vancouver Barracks, Washington.
WAC—Report to Aviation Concentration Camp, Waco, Tex.
WCS—Wire to the Chief Signal Officer upon arrival.
WDM—Wire, Director of Military Aeronautics, upon arrival.
WFO—Report to Wilbur Wright Field, Fairfield, Ohio.

Notes

Note 1—Report to places mentioned in order named for temporary duty.
Note 2—Report to Dayton, Ohio District Accounts office. Wire DAP.
Note 3—Report to Dayton, Ohio, Chief Technical Section.

"L'Aiglon", one of the veteran Caudron machines, which is now a war trophy

FOREIGN NEWS

French Honors for Colonel Bishop, V.C.

It was announced on October 4th that Lieut.-Col. W. A. Bishop, V.C., D.S.O., M.C., D.F.C., has been made a Chevalier of the Legion of Honor, and been awarded the Croix de Guerre (with palms) for distinguished service in the zone of the French Armies.

Aircraft in the East

What the mastery of the air means in warlike operations is well illustrated in the reports which have come to hand relating to General Allenby's splendid victory over the Turks in Palestine. Thanks to the overwhelming nature of the British aerial equipment in this theatre of war, the enemy seems to have been entirely without warning of the blow which was in preparation. During the battle itself, but one solitary aerial scout made its appearance over the lines, and it was promptly driven off! The Turk was thus compelled to give battle blindly, believing that the impending blow was destined to fall in a direction totally different from that designed by the British commander.—*Flight.*

Germans Begin to Deliver Aeroplanes to Allies

With the American Army Near Verdun.—The first flocks of the 1,700 German aeroplanes which are to be turned over to the Allies by the terms of the armistice were winging across the lines to settle down peacably in our aerodromes when I walked down the road from Haumont toward the front on November 11, says Stephen Eyre in one of his cables to this side.

Turks Welcome British Fliers Led by Yale Man

Mudros, Island of Lemnos, Aegean Sea.—Nine British aeroplanes landed at Galatea, a suburb of Constantinople, two days after the signing of the Turkish armistice October 31. The first allied officer to reach European Turkish soil was Flight Commander Henry Wiser, a Canadian and a graduate of Yale in 1912.

The Turks gave the airmen an enthusiastic reception, declaring they were thankful that Turkey had been cleared of Germans, who had fled to the Rumanian and Russian ports in the Black Sea.

The Turks said they were eagerly awaiting the arrival of the allied fleet, which had been concentrated at Mudros.

An allied army and navy entry probably will be made simultaneously at the Dardanelles. No military occupation of Constantinople at present is probable unless disorder demands that such a course be taken.

A commission composed of British naval and military officers is now inspecting the forts of the Dardanelles, under escort of a son of Tewfik Pasha, Grand Vizier, with a view to occupation.

Aeroplanes Take Food to Reclaimed Italy

Washington.—Caproni aeroplanes are being used by the Italian supreme command to transport emergency rations to the famished citizens of the liberated cities of Italy and also of Pola and Fiume, said an official despatch from Rome.

Coppens's Thirty-First Victory

Belgian Official: On September 27 two enemy balloons were brought down in flames by our aviators. One of them was brought down by Flight-Lieutenant Coppens, who thus achieved his thirty-first victory.

64 Foe Planes Downed

London.—Sixty-four enemy planes were destroyed and 15 others driven down out of control on the western front November 1, says an official communication issued dealing with aerial operations.

French Aviation in the Battle

The following account of the work of French aviators in the recent battle has been communicated through the Press Bureau by the wireless stations of the French Government:—

On September 29th, during the day, misty weather and low clouds did not prevent the French aircraft from effecting a considerable amount of work. In the course of engagements in which they clearly maintained their ascendency over the enemy. French aviators destroyed or disabled 25 aeroplanes, and set fire to two captive balloons. In spite of poor visibility, French bombing machines successfully carried out several operations, flying over their objectives at low altitudes. Twenty-six tons of explosives were dropped on the enemy's convoys and bodies of troops in the battle area, especially at Challerange, Liry and Mont Saint Martin, and thousands of cartridges were fired on German troops in action. Besides this, the French aviators did extensive registering, and accomplished a great many reconnaissances far ahead of the hostile lines.

Allied Co-operation

The "Times" special correspondent on the Western Front writes on October 1st:

The co-operation of the Air Force, both Belgian and British, in the northern battle seems to have been most brilliant as soon as the weather permitted, and has continued throughout the advance. The Belgian flying men have always shown themselves most intrepid and gallant pilots.

The weather seems to have cleared, and the sun has shone nearly all day.

The A. F. C. in Palestine

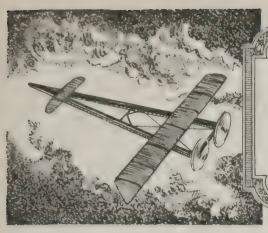
Mr. H. S. Gullett, war correspondent with the Australian Force in Palestine, writing on September 25th, says:—

A few Australian aviators have been engaged among our Arab Allies to the far east of the Jordan. At the last they lived with the Arabs and did much effective bombing and reconnaissance in places beyond the range of the Air Force on this side. One day they crashed two enemy planes among the Arabs, who were frantic with delight and excitement. They also drove down more than three others. This adventure had a profound effect on our Allies, and spurred them up to continue and increase their fine efforts. Their escapades include blowing up railways and raiding Turkish posts, and were of a very exceptional kind.

An Aeroplane as a Decoy

From the "Daily Chronicle" of October 5th:—

Two British aviators, at great personal risk, enabled a successful local raid to be made with hardly a single casualty to the attacking British.



It had become necessary to take a small salient in the line. The Germans were expecting an ordinary attack, with its preliminary bombardment. Early in the morning a British aeroplane passed very low over the front trenches, and purposely flew slowly parallel to the German line, but about five or six hundred yards behind it.

The Germans thought this a target not to be missed, and unsuspectingly fell into the trap set for them, by turning their backs to the British trenches, in order to fire on the machines. Whilst they were thus busily engaging the aeroplane, the British infantry leaped from their trenches, and captured in a few minutes a position to which considerable importance was attached by the British Staff, incidentally taking quite a number of prisoners.

The aeroplane reurned to its aerodrome, riddled with bullet holes, but fortunately, both the pilot and observer were unscathed.

Two British Sopwith Camels and a De Haviland in the air

ELEMENTARY AERONAUTICS *and* MODEL NOTES

By John F. McMahon

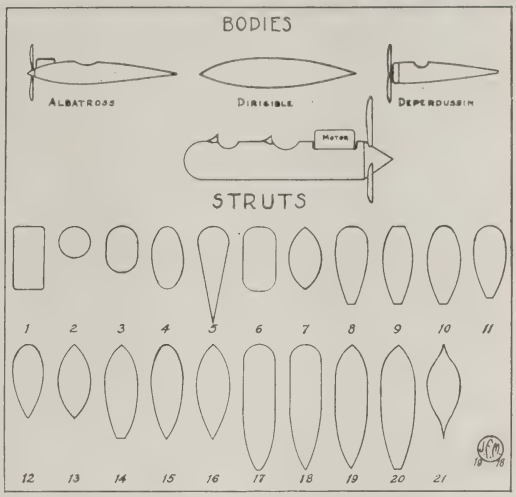
Model Aeroplane Building as a Step to Aeronautical Engineering

THE other method of determining the resistance of a body is to look up a table of "fineness ratios" of aeroplane bodies. The "fineness ratio" is determined from the ratio of the greatest depth to the length of the body; in other words, should the body measure 3 ft. through its greatest cross section and 21 feet long, the ratio would be 7, as 3 is contained into 21 seven times. The resistance of a body can never be found exactly, and must be tested in a wind tunnel for exact figures, because the resistance varies according to the conditions, such as shape of nose, number of openings for aviators, attachments of wings, and landing gear, whether the motor is partly exposed or entirely covered, and if radiator is set in front, attached to the sides or mounted on the top of the body.

Resistance for a body having a shape like that in use on the German Albatross scouts, which is almost a perfect streamline, figures out as approximately 15 lbs. at 60 M.P.H., the resistance of the radiator and that part of the engine which is exposed along with opening around the engine, opening of cockpit, etc., must be added to this, which would bring the total resistance of the body up to about 40 lbs. A perfect streamline body of "dirigible" form being 5¾ times as long as its greatest width, and whose greatest cross section figures out at 8 sq. ft. area has a resistance of only 7.4 lbs. at 60 M.P.H. That is, if no openings or other irregularities occur to disturb the wind when passing the body.

A body like the old Deperdussin racing monocoque, having a rotary motor partly enclosed in the nose and whose length is 5.6 times its greatest thickness figures out 15.6 pound resistance when the greatest cross section figures out at 8 sq. ft.

Pusher bodies have less resistance than tractor bodies, because the body is not in the slip stream of the propeller, but when you consider the uncovered outriggers in use on pusher machines the resistance is found to be much greater than for tractor machines.



The Continental Pusher Biplane, which was described in AERIAL AGE some time ago, is a good type for a pusher machine, because through the elimination of struts on the outriggers the resistance was cut considerable. The body of this machine, which was made of veneer, and of very good streamline shape, showed a resistance of only 10 lbs. at 60 M.P.H. See attached cut.

Resistance of Struts

The resistance of struts varies according to the shape, and from the table accompanying this article the reader can determine the weight and resistance per 100 ft. of strut. (This weight is for spruce struts.)

No.	Resistance in lbs. for 100 ft. of strut 1 in. wide at 60 M.P.H.	Weight per 100 feet of strut if made of spruce.
1	104.4	41.6
2	81.9	16.4
3	59.2	30.4
4	36.9	34.8
5	63.0	33.4
6	28.6	37.7
7	54.9	30.0
8	12.8	39.7
9	12.8	41.0
10	13.5	39.7
11	13.5	38.0
12	29.9	36.4
13	45.9	36.6
14	14.2	51.9
15	13.5	47.0
16	18.7	44.1
17	15.1	71.0
18	16.4	67.2
19	13.5	62.0
20	13.5	66.1
21	24.6	42.5

The designer would naturally select the strut that shows the least resistance and weight. This will be found to be strut No. 8. Again the designer may wish to use one single strut in place of two, in that case he would use a strut somewhat like No. 9, which has less weight than if two No. 8

struts were used, but the resistance is higher on account of the added skin friction.

To figure the total resistance of struts we simply find the number of feet of strut used on the machine. For instance, we will say that the gap between the planes is 5 feet, and we will use eight interplane struts on the outer section of the wings and four 2½ feet struts over the body, then we have (8 × 5) plus (4 × 2½), or 50 feet of strut. Upon consulting the table we find for the No. 8 strut 12.8 lbs. per 100 feet of strut; then for 50 ft. the resistance would be one-half this amount, or 6.4 at 60 M.P.H. The weight, if made of spruce, would be one-half 39.7 lbs., or 19.85 lbs. for the 50 feet.

Wires, Cables, and Fittings.

The resistance of wires, cables and fittings can only be approximated, and for the lack of any better method would be quite safe for us to consider the resistance of these parts as 10% of the total resistance. Stranded wire or cable has about 20% greater resistance than smooth wires. If, when double wiring is used, a fairing strip of streamline form is placed between the wires, the resistance is reduced considerable. Again, inclined wires or cables offer less resistance than vertical. For instance, the wires on a staggered plane, control wires running fore and aft, etc.

(To be continued)

A model of a Nieuport made by John Krawie of the Illinois Model Aero Club. This machine has a spread of 35 inches on the top wing and 17 inches on the lower wing. The weight complete is 4 ounces

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

Enthusiasm

Salute, oh Earth dwellers! with our motto of youth and joy, we greet ye, miserable mimes of the old mud ball!

As youth, we speak, for the call of the air echoes instinctively in the heart of youth, where there is blood of buccaneers clamoring for adventure, where grows a spirit of fearless enthusiasm, and where abides iron courage to rule the tense muscles; the keen eye, and the tingling nerves in the sport of all sports—the game of the young gods.

And Pan piped for a chorus!

For verily, every jaunt in ether is a joyride, the lever that guides us through the boundless space is a joystick, and in every way the life of lives in a reckless, wild, voluptious carnival of joy!

Enthusiastic, is it?

Yes, we are bubbling and gurgling with it! Moreover, gentle reader, take warning if you are one who chooses to sneer at children of enthusiasm, steer clear of these few lines, but, far more, dodge desperately all the wild young devils who are careering above space.

Our swank is simply boundless, and why not? Aren't we the Senior Service? The Infantry are mud dabblers, the Cavalry are stick-in-the-muds, the Artillery are camouflaged mud flounders; but who skims aloft, clear of the flotsam, shell-churned fields of Flanders, throwing mud at all others, but above muck, flying through clean pure wholesome fragrant air.

Why, us, of course.

Contempt for all the services. Long live swank in the R. A. F. Which reminds us that only a couple of months ago, we, of the R. F. C., hated to have wings on our machines because the R. N. A. S. had them, and none the less spurning were the Amphib aviators, who turned up snobbish noses at us and contemplated doing without engines because we had them.

But now all is one! Divided we stand, united in our contempt for all and sundry lubbers of the land, and above all for that fungus of the air, that sausage-shaped canteen of the atmosphere—the gasbag.

And where is the war to be won? In the air, of course, indubitably beyond cavil, and why ask silly questions with obvious answers.

Ah, yes, we are the handy kids when it comes to packing pestiferous wars away in our little air pockets.

There is really no dimension in Euclid that can circumscribe our accomplishments and our swank.

Who dropped 100,000 pounds of food into General Townshend's camp at Kut? Who, on shanksponies, or his trains, his liners, or his motor cars, has duplicated the feat of the Handley Page that flew from London to Constaninople?

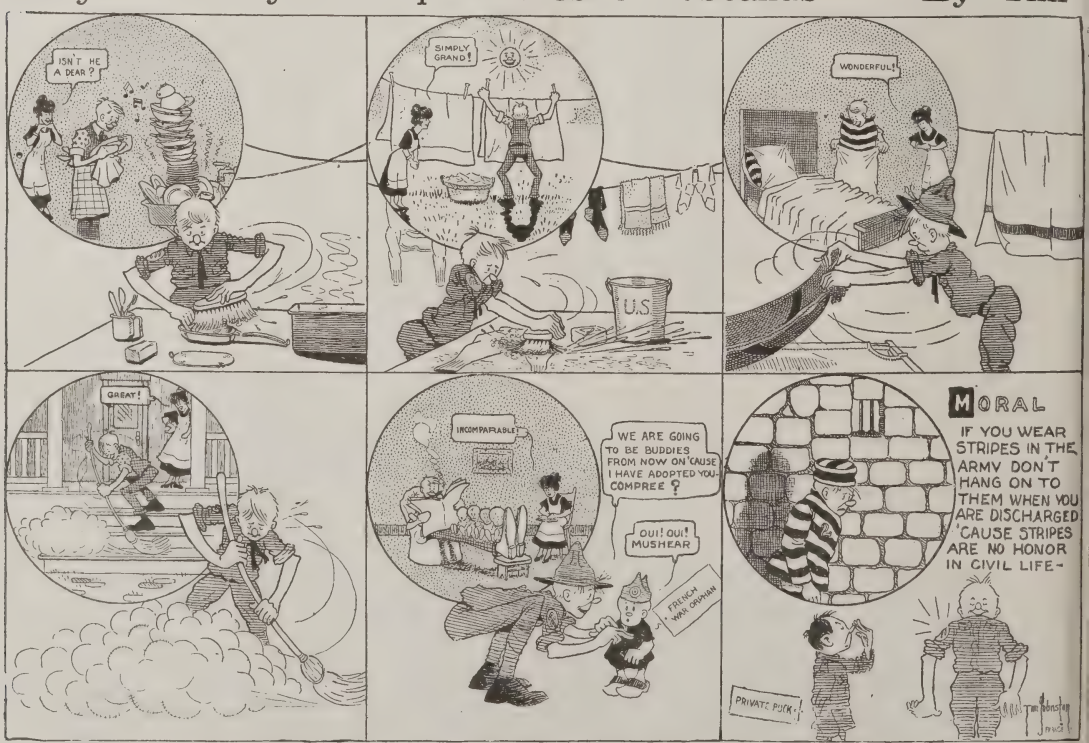
Who, on terra-firma, has taken twenty-one full grown people to a height of 7,000 feet? Why, gentle, and by now, I hope, completely squelched reader, the answer is Airgods, race whirlwinds, and us.

Listen ye to the words of a contemporary ravista, and keep awesome silence as the aeroplane speaks. Ah! Readers, smile not unbelievingly, as you smiled but a few years past.

There may be greater wonders yet. Consider that as the speed increases so does the momentum in the mass of the aeroplane become terrific. And bearing that in mind, remember that with altitude gravity decreases.

There may be literally other worlds to conquer. We now have Aero Mail. We may yet circle the earth in a day.

It's all helicopters and ornithopters to me what all this means, but from the general drift, I opine Shakespeare may yet have to prod his Puck if he doesn't wish him overtaken in the cloudlands.



Totally smothered and, I avow, completely silenced reader, do you mind my obliterating you utterly with one more quotation?. "In time to come it will be a world without distance and without time, a world inhabited throughout, a Lilliputian world that can hold no darkness, no uncivilization, and no surprise. That world lies entirely within the imagination and capabilities of the designers and constructors.

Down, down, most miserable reader, down and worship. Infantrymen, present your arms. Cavalry! out with your sabres and saluute, guns boom out the salvo of honor. All ye insignificant, grovelling earth-crawlers, down—with your backs flat and your faces in the dust—down and worship me!

I'm a ground pilot! and I expect my license by the first mail tomorrow!

Creation's Dream!

Why The Army Develops Domestic Husbands — By "Tim"

(Continued from page 563)

Parcel Post Can Be Speeded Up

"The cost of aerial mail night and day letters will be less than that of wire communication. The cost of an aerial mail letter is 16 cents for two ounces. For this price there can be sent a message that would cost $5 to send by telegraph.

"The estimate of $50,000,000 of potential postplane business takes no account of the possibilities of transporting parcel post aerial mail. One of the Caproni 2,100-horsepower machines now in operation could easily transport 2,500 pounds of mail. At least $25,000,000 worth of parcel post could be sent by aeroplane.

"Enthusiasts who look forward to the transatlantic transportation of aerial mail as certain to come within the next twelvemonth assert that there is another twenty-five million dollars' worth of transatlantic mail waiting for an aerial mail service. They point out that Uncle Sam now pays 80 cents a pound to American steamships to carry transatlantic mail and that a charge of $1 per letter across the Atlantic would be a paying proposition."

Aero Mail Pilot Eats Lunch En Route

William Dishler Warner, the inventor of the Warner Knee Control, has received an immensely interesting letter from Pilot Robert F. Shanle, of the New York-Philadelphia-Washington aero mail service. It follows:

"Mr. Chas. King, Chief Mechanic of this field, has equipped the planes I fly in the New York-Philadelphia-Washington air mail service with the 'Warner Knee Control.'

"The Warner control allows me the free use of both hands, and as schedule leaving time is twelve noon every day, I now take my lunch with me and eat it while en route.

"I consider the knee control a great advantage to cross-country fliers."

American-Made Aeroplane Cotton Fabric Now Produced for All U. S. Amy Needs

The War Department authorizes the following:

The production of American cotton aeroplane fabric is now averaging about 1,200,000 yards monthly, sufficient for all requirements, and capable of being largely increased if necessary. No more linen fabric is being imported from abroad for this purpose, and after the imported stock now on hand is exhausted, cotton fabric will be used exclusively in covering American aeroplane wings.

At the outbreak of the war in 1914 linen was the only material which had proved entirely satisfactory for covering aeroplane wings, the essential physical properties required being lightness in weight, proper absorption of dope, and strength and resistance to tear.

Pre-War Production

The chief countries before the war producing flax for fine grades of linen were Belgium, Russia, and Ireland. The Belgian supply was cut off from the Allies in 1914. The Russian flax was difficult to obtain and was later cut off entirely. In the meantime the consumption of linen for war purposes had increased enormously. By the spring of 1917, when the United States entered the war, the linen situation was very serious, and it was obvious that some substitute would have to be found.

In developing a cotton aeroplane fabric which would have the necessary qualities of the linen the United States Government received the greatest assistance from the various cotton mills.

Samples were made from cotton of many constructions and numbers of yarn, varying from No. 40 two-ply to No. 100 four-ply, the cloth having from 50 to 90 threads per inch. Yarns were in some cases mercerized under tension and various twists were tried. Several cotton mills co-operated in this work.

Testing of Samples

When the new fabrics were secured samples were put on aeroplanes, "doped" and varnished, according to regulation practice, and tested in actual use at Langley Field and Pensacola. Flying tests were also made with several other varieties of fabric. The tests were for three months of service, averaging 10 hours per day. Members of the United States Air Service, members of the foreign flying corps, and other experts assisted in the experiments. They reported that the cotton fabrics developed in the United States appeared to serve most favorably. Other very favorable reports have recently been received from tests made in Great Britain on American cloth sent over there.

After many experiments had been made the first contracts for 10,000 yards each of cotton aeroplane fabric were placed in the middle of September, 1917. The results obtained with the first cotton fabric produced were satisfactory and it was decided to place further contracts for cotton aeroplane fabric.

Adopted Last November

Two fabrics were adopted, the specifications calling for a strength of not less than 80 pounds per inch in both warp and filling. The cotton used in the manufacture of the cotton aeroplane fabric had to be of a very long staple, and in November, 1917, the Air Service purchased 15,000 bales of long-staple Sea Island cotton.

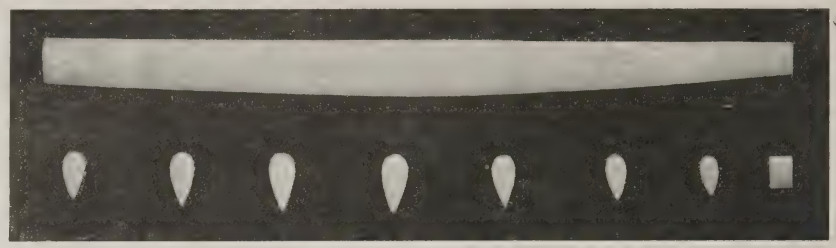
The first quantity orders for cotton aeroplane fabric were placed in October and November, 1917, and were for 1,280,000 yards of grade A and 200,000 yards of grade B cotton aeroplane fabric. Deliveries of cotton aeroplane fabric started in January with the production of 173,000 yards. Production has gradually increased until at the present time 1,200,000 yards are being produced monthly.

Subsequent Contracts Let

Subsequent contracts have been let for cotton aeroplane fabric amounting to 11,513,084 yards. All of these later contracts, however, have been for grade A cotton fabric, as it now seems clear that this cloth is superior to the other.

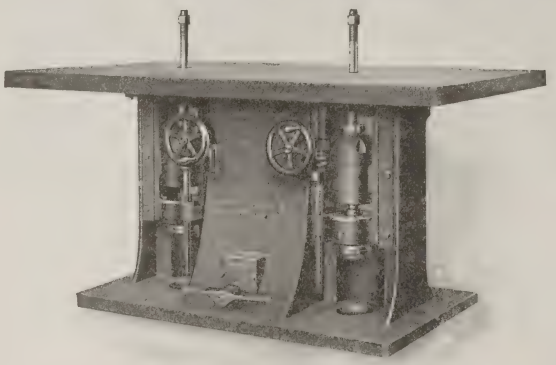
While the cotton aeroplane fabric was at first only used for training planes, and the grade A standard linen fabric, which was imported from Great Britain, was used for combat planes, it was decided in April, 1918, that the grade A cotton fabric could be used for all types of planes.

War Trade Board Interprets Ruling as to Balsa Wood



The War Trade Board announces in a new ruling (W. T. B. R. No. 318) that they will not construe balsa wood as included in the restriction announced in W. T. B. R. 284, issued October 21, 1918, covering all wood as specified in or classified under paragraph 647 of the tariff act of 1913, except cedar. W. T. B. R. 284 has therefore been amended to read:

"The War Trade Board have, by a new ruling, extended the restriction upon the importation of wood. All outstanding licenses for the importation of wood as specified in or classified under paragraph 647 of the tariff act of 1913, except cedar and balsa wood, have been revoked as to ocean shipment after October 25, 1918. Hereafter no licenses will be issued for the importation of wood as specified in or classified under paragraph 647 of the tariff act of 1913, except cedar and balsa wood, other than to cover the following:



"1. Shipments from Mexico or Canada by other than ocean transportation, when such commodities originated in such countries.

"2. Shipments from Europe or Mediterranean Africa when coming as return cargo from convenient ports where loading can be done without delay."

The War Trade Board regulation affecting the importation of balsa wood will be found in W. T. B. R. 273, issued October 17, 1918.

The Gift Your Aviator Wants

Non-Shatterable
RESISTAL EYETECTS

He can always use a pair of these non-shatterable goggles recommended by U. S. Army and standardized by U. S. Navy. Write for Booklet of aviators' experiences. Go to the Store where EYETECTS are sold, or—send $12 and his address for the goggle he wants. We guarantee delivery and satisfaction. Money back if you want it. Order now for timely Christmas delivery.

For Army and Navy Flyers

Manufactured only by STRAUSS & BUEGELEISEN 438 Broadway New York City

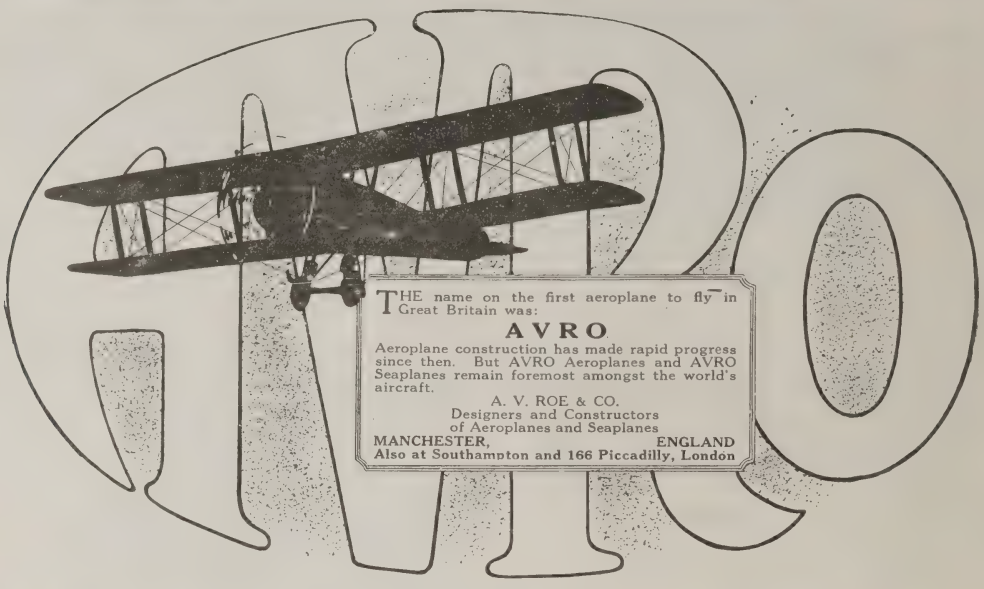
thrills by dashing down and spinning their landing wheels on the surface of the Brazos River.

Pathe News' Movie Man was on hand for the occasion to film the events of the day and he obtained some excellent pictures of aeroplanes in formation and stunt flying which will be soon released to the public.

Major Whitesides, Commanding Officer of Rich Field, is in receipt of a congratulatory telegram upon the success of the flight from Major-General William L. Kenly, Director Department Military Aeronautics.

Aside from the spectacular display, this remarkable formation of one hundred and forty-nine ships is looked upon as indication of the progress being made by the flying schools of the United States. With so many ships in line, representing eight of the country's different flying fields, this Rich Field Formation will go down in Air Service history with the credit it deserves.

Long Flight in Bomb Plane



Washington.—A big Handley-Page bombing aeroplane arrived at Bolling Field here at 2:55 o'clock on November 13 from Hazelhurst Field, Mineola, L. I., having made the trip of 230 miles in three hours and one minute actual flying time. The machine was forced to stop at Alfred Vail Field, Little Silver, N. J., because of a broken oil connection.

The plane left Hazelhurst at 9:25 o'clock and was piloted by Capt. Weller of the British Royal Air Forces, with Lieut. Ludick of the United States Army Air Service as guide. Four passengers were carried. The flight was made at an average of 4,000 feet. A sleet storm was encountered while passing over New Jersey.

Most Wounded of Fliers Sent Home

Major Malcolm McB. Bell-Irving, Vancouver, the first Canadian aviator to win the Distinguished Service Order, landed at an Atlantic port on November 11, bearing more wounds than any other member of the Royal Air Force and forced out of the service against his will.

The Major has an artificial leg, a badly scarred face and a gold plate over a great gap in his skull. His final injuries were not received in battle, but in a flying stunt, as instructor at Gosport, England, in the spring. He crashed to earth and was picked up unconscious, his left leg smashed and otherwise hurt. They told him recently, after he was well enough to walk, to go home.

Aeroplanes and Parts

Report from Pershing a Record of Victory

Washington.—General Pershing has cabled the following report for the operation of November 8:

"Despite adverse weather conditions our aviators, flying at a height of 100 metres, carried out a number of reconnaissance missions. They bombed and machine gunned concentrations of enemy troops in Baalon and Remoiville and blew up an ammunition dump at Gibercy. Four enemy balloons were destroyed and three enemy aeroplanes were shot down during the day. One of our planes is missing."

Those Who Went "Over the Edge"

A memorandum for the Commander of the Army Balloons, First Army, contains the following list of observers who have made parachute jumps on the line under fire with a slight history of each case.

1st Lieut. Paul N. A. Rooney, 4th Company, A. S., U. S. A. Two jumps; July 22, 1918, Lt. Rooney and Lt. Ferrenbach performed a mission in balloon opposite Seicheprey. The balloon was attacked and burned; both observers jumped. They ascended four hours later in another balloon and continued the work. September 26, 1918, during the advance northwest of Verdun, Lt. P. N. A. Rooney and Lt. E. S. Montgomery, both 4th Co., were forced to jump when attacked by three enemy planes.

2d Lt. E. S. Montgomery, 4th Company, A. S., U. S. A. One jump given above with Lieut. Rooney.

1st Lt. Winfred C. MacBrayne, 102 F. A. (4th Company). One jump; September 2, 1918, Lt. MacBrayne and Sgt., 1st Class, Normal Brunnel, performing a mission during the advance near the Vesle River, were forced to jump when an enemy plane dove and fired upon the balloon.

Sgt., 1st Class, Norman Brunnel, Student Observer, 4th Co. One jump given above with Lt. MacBrayne.

1st Lt. S. V. Clarke, 9th Co., A. S., U. S. A. Two jumps; August 28, 1918, Lt. S. V. Clarke was forced to jump from balloon when attacked by an enemy plane. The balloon was burned. He ascended a few hours later in another balloon. September 26, 1918, Lt. S. V. Clarke and Lt. S. E. White were observing in balloon when attacked by an enemy plane. The balloon was burned. Both observers showed coolness in jumping, one waiting for the other's parachute to open before going over.

2d Lt. S. E. White, 9th Co., A. S., U. S. A. History of this jump given above with Lieut. Clarke.

1st Lt. James A. McDevitt, 11th Co., A. S., U. S. A. Four jumps. September 17, 1918, at Mamey, Lt. McDevitt jumped when attacked by enemy plane. October 5, 1918, Lt. McDevitt jumped during the advance northwest of Verdum. There were eight holes in the balloon and four in the basket from the enemy's bullets. October 6, 1918, Lt. McDevitt while observing in a balloon was atacked by two enemy planes and forced to jump. Eighteen minutes later he ascended and continued his work. October 6, 1918, Lt. McDevitt was attacked the second time an hour and eight minutes later. He jumped. The balloon was burned.

2d Lt. George D. Armstron, 11th Company, A. S., U. S. A. Three jumps. September 26, 1918 Lt. Armstrong, while in a balloon at Germanville, during the drive Northwest of Verdun, was attacked by enemy planes and forced to jump. October 6, 1918, Lt. Armstrong was forced to jump when his balloon was attacked by an enemy aeroplane. October 6, 1918, Lt. Armstrong was attacked by two enemy aeroplanes, Fokkers, and forced to jump. He reascended immediately but was forced to jump again thirteen minutes later. There was one bullet hole in the basket.

1st Lt. Birge M. Clark, 3d Company, A. S., U. S. A. One Jump: August 30, 1918, 1st Lt. B. M. Clark and 1st Lt. Ralph L. Dold were forced to jump when attacked by a German Pfalz plane. This jump occurred at Brouville, Meurthe et Moselle while under the jurisdiction of the 6th Corps of the 8th French Army. The balloon was not burned. Eight holes were found in the fabric.

1st Lt. Ralph S. Dold, F. A., U. S. A., attached to 3d Company. One jump as above.

1st Lt. Harlou P. Neibling, F. A., U. S. A., attached to 3d Company. Two jumps: September 2, 1918, near Brouville, Meurthe et Moselle, France, while under the jurisdiction of the 6th Corps of the 8th French Army, 1st Lts. Harlou P. Neibling and George C. Carroll were attacked by two enemy aeroplanes and forced to jump. The balloon was burned. September 26, 1918, 1st Lt. Harlou P. Neibling and George C. Carroll were forced to jump during the advance Northwest of Verdun when attacked by two enemy planes. The balloon was burned.

1st Lt. George C. Carroll, 3d Company, A. S., U. S. A. Two jumps as above.

151 Loops Made in Aeroplane

Dallas, Tex.—What is said to be the world's record for consecutive loops in an aeroplane was made at Love Field on Nov. 12 by Lieut. W. T. Campbell, who made 151 loops. The old record, 143 loops, was made recently at San Antonio by Lieut. Edward Stinson.

Iowa Aviator Escapes from Austrian Prison

Trieste—Aviator C. O. Young of Des Moines Ia., who was supposed to have been killed, has arrived here with a number of Allied prisoners who succeeded in escaping from Austrian concentration camps owing to local riots. With him was Paul G. Ratliff of Drew, Miss.

Drop Fliers' Death List

With the American Army in France—In a recent night raid upon Toul by German aviators the Germans not only dropped bombs, but a flaring parachute containing a list of American fliers who are dead within the German lines or are prisoners.

The list, which was headed "Americanische Flirgerkorps," contained thirty-five names, sixteen of them given as dead and the others as prisoners, some of them wounded. The list was signed by Lieutenant A. B. Kraft.

(*Continued from page 562*)

When 50 per cent has been recovered in the receiver the thermometer shall not read more than 203 degrees Fahr.

When 90 per cent has been recovered in the receiver the thermometer shall not read more than 235 degrees Fahr.

When 96 per cent has been recovered in the receiver the thermometer shall not read more than 257 degrees Fahr. and the end point shall not exceed this temperature by more than 27 degrees Fahr.

At least 96 per cent must be recovered in the receiver from the distillation.

The distillation loss shall not exceed 2 per cent when the residue in the flask is cooled and added to the distillate in the receiver.

The United States War Department requires the Fighting Grade to be colored Red after inspection and acceptance.

Volatility and Distillation Range—Domestic Grade

When 5 per cent of the sample has been recovered in the graduated receiver the thermometer shall not read more than 167 degrees Fahr. or less than 122 degrees Fahr.

When 50 per cent has been recovered in the receiver the thermometer shall not read more than 221 degres Fahr.

When 90 per cent has been recovered in the receiver the thermometer shall not read more than 311 degrees Fahr.

When 96 per cent has been recovered in the receiver the thermometer shall not read more than 347 degrees Fahr.

At least 96 per cent must be recovered in the receiver from the distillation.

The distillation loss shall not exceed 2 per cent when the residue in the flask is cooled and added to the distillate in the receiver.

DETROIT, MICH.

"SERVICE"

"NORMA" PRECISION BALL BEARINGS

(PATENTED)

Estimate the serviceability of a machine by the staying power of its weakest part—that it is which sets the limit of service. Analyze it for the essentials. Follow the factors in serviceability through every detail, to the small parts which—while seemingly insignificant—yet determine the capacity of the machine as a whole for maintaining its performance.

The bearings of the electrical accessories of airplane, car, truck, tractor, or power boat determine the service capacity of these machines. Which explains why "NORMA" Precision Bearings are the standard bearings in the ignition apparatus and lighting generators always preferred where maximum service is sought.

Be SURE. See that your electrical apparatus is "NORMA" equipped.

AERO MAIL SERVICE PLANS FIFTY NEW LINES

THE immediate establishment of fifty new air mail lines is contemplated by the Post Office Department and will be effected almost at once through the use of army aeroplanes, equipment and trained personnel if the War Department can be induced to turn over its surplus planes and fliers. Necessity for rapid action has arisen, according to the Aero Club of America, through the fact that hundreds of army aviators have been notified that they must resign within a few days or identify themselves with the regular army.

According to Captain B. B. Lipsner, Superintendent of the Aerial Mail Service, who came to New York to consult with aircraft men whose aid in extending the service he desires to enlist, ample authority already exists for the army to turn over to the Post Office Department all the essentials of a nation-wide air service. He declared the last general army appropriation bill provided that such disposition should be made by the army of all superfluous material which it did not require for actual combat and training purposes. Captain Lipsner said that Secretary Baker is in cordial sympathy with the expansive program of the aero service.

Development of aero mail service to a point where rapid transmission of millions of letters from New England to the far South and from coast to coast will be but a matter of weeks or months may already be on the verge of accomplishment, according to Henry Woodhouse and other leaders here, as they said it was possible favorable action already had been taken by the War Department on the request of the Aerial Mail Service for its fliers, planes, and general equipment. They pointed out that the recent resignation of John D. Ryan, Assistant Secretary of War and Director of Aircraft Production, and with him of a number of minor chiefs of the army aero service, had possibly obscured for the moment favorable action already taken by the War Department. If this is not so, Mr. Woodhouse added, their going would delay such action only momentarily, for the army could not use a fraction of its men and planes. Alan R. Hawley, of the Aero Club of America, last night sent this telegram to Secretary Baker:

"Hundreds of army aviators who have been notified that they must decide in a few days whether to resign their commissions or join the regular army have applied to the Aero Club of America for positions. Most of them are anxious to join the Aerial Mail Service; therefore, we urge that the time in which they must place their resignations with the army be delayed long enough to permit them to connect themselves with the Post Office for aerial mail service.

Country Wants Aero Service

"Second Assistant Postmaster General Praeger and Captain B. B. Lipsner, the Superintendent of the Aerial Mail Service, have been preparing for exactly such an emergency, and they are ready to establish fifty aerial mail lines throughout the United States and employ 1,000 military aviators to carry mail. You can hasten the establishing of these aerial mail lines and employing of these aviators by turning over to the postal authorities 500 of the aeroplanes which the army cannot use at present, and which will deteriorate and be wasted unless they are turned over to the Post Office.

"We know from the hundreds of requests received from the Chambers of Commerce throughout the United States that the country as a whole wants the extension of the aerial mail service, because it has been run at 100 per cent. efficiency for six months and promises to solve some of the most difficult problems of mail transportation and distribution."

Captain Lipsner said that the 100-per-cent. success already scored by the aero mail service, without the loss of a man or a machine, amply justified its ambitious program, and that the millions of letters already transported afforded indisputable evidence that the business public is eager for extension of the service. He said that already many highly trained fliers and mechanics are returning from the battlefields of Europe and are eager to turn their training to good account.

In defining the army equipment which would be most valuable to the postal men, Captain Lipsner mentioned the vast accumulation of instruments of all sorts, as well as hundreds of Handley Paige planes which can carry one and one-half tons of mail at the rate of 100 miles an hour, more hundreds of De Havilands, each of which can transport 1,000 pounds of mail at the rate of 140 miles an hour, and numerous other twin-motor types of aeroplanes readily adaptable to the mail service.

Transcontinental Airways

Rear Admiral Robert E. Peary, President of the Aerial League of America, Chairman of the National Aerial Coast Patrol Commission and of the Committee on Aeronautic Landing Places of the Aero Club of America, recently has completed a survey of the logical transcontinental airways in the United States. His conclusions, which are expected to be of material value in the development of the aero mail service, are to be published soon by the Century Company in the first American Aero Blue Book, edited by Henry Woodhouse. Admiral Peary says:

"Among the things being done to so assist the Government in its plans for aerial development is the plan of the Aero Club of America to establish eight great American airways and a number of air routes, which plan is being developed by the Committee on Aeronautic Maps and Landing Places of the Aero Club of America, with the co-operation of the thirty affiliated aero clubs, the Aerial League of America, and as many co-operating organizations. The term airways is used for transcontinental airways; air routes for interconnecting routes. The five transcontinental airways and the three coastal airways will be as follows:

"1. The Woodrow Wilson Airway, which is an almost straight line from New York to San Francisco, touching Cleveland, Toledo, Chicago, and other important cities on the way to San Francisco. The straight line has been generally approved because it presents the best principle of air travel, which can be done in a straight line, as the aviators can make their own route, flying over all obstructions.

"2. The Wright Brothers' Airway.—Starting from Washington, Fort Myer, where the Wrights made their first public flights, and through North Carolina, the State where the Wrights made the historic first flight, through Georgia, Alabama, Mississippi, Louisiana, Texas—with a station at San Antonio, where an aeroplane, a Wright machine, was used for the first time in history under conditions approximating warfare, then through New Mexico, Arizona, ending at San Diego, Cal.

"3. The Langley Airway.—Named after Professor Samuel Pierrepont Langley, the pioneer experimenter in aeronautics. It will start from Philadelphia, pass through Pittsburgh, Columbus, Dayton, Indianapolis, Rantoul, St. Louis, Kansas City—and then on to Santa Barbara, Cal.

"4. The Chanute and Bell Airway.—Named after the American experimenters in aviation, Octave Chanute, who encouraged and assisted the Wright brothers, and Alexander Graham Bell and Mrs. Bell, who paid for the early experiments of Glenn H. Curtiss. It will extend from Boston, Mass., to Seattle, and Portland, Ore., touching Albany, New York, Syracuse, Rochester, Erie, Buffalo, Detroit, Grand Rapids, Mich.; Minneapolis, Minn.; Bismarck, N. D.; Great Falls, Mont., and other cities along the route.

"5. The Rodgers Airway.—Named in honor of Calbraith Perry Rodges, the American aviator who was the first to make a transcontinental flight, in 1911. It will extend from Newport News and Norfolk, Va., to Los Angeles, Cal., touching the important cities and towns on the way.

"6. The Atlantic Airway will extend from Bangor, Me., to Key West, Fla., and will touch every city on the Atlantic seaboard.

"7. The Gulf Airway will extend from Key West to the mouth of the Rio Grande, following the coast and touching every city on the Gulf seaboard.

"8. The Pacific Airway will extend from San Diego to Puget Sound, following the coast line, touching every city on the Pacific seaboard."

John D. Ryan Says Hundreds of New Planes Are Available for Mail Service

Under the plans for the demobilization of the army circular orders have been issued by General March for the discharge from the military service of all officers not members of the regular army as rapidly as their services can be dispensed with. A conference was held last week between Otto Praeger, Second Assistant Postmaster General, and John D. Ryan, then Director of the Army Aircraft Service, relative to the use of army aeroplanes. In this conference types of army planes were considered with a view to ascertaining the extent to which they might be utilized in peace work.

Mr. Ryan said tonight that the number of aeroplanes already built which the army would be able to spare, as well as planes in course of production, would run into the hundreds, and that he had told Mr. Praeger the army would be glad to sell to the postal service those which were available for its purposes. Mr. Ryan also said that thousands of aviators would be released from the army at the close of the war, and that any army aviator not discharged who wished to enter the aero mail service, instead of asking for a transfer, might apply for his discharge from the army with a view to entering the new service.

War Department officials wish to encourage the development of the aero mail service as much as possible because they recognize that the latter will absorb many of the most promising of the young men from civil life who entered the army and became expert fliers, and that the use of aircraft by the mail service will contribute largely to the development of the aircraft industry in the United States.

MEETING DEMAND FOR LANDING PLACES FOR SPORT AND PLEASURE

THE Committee on Landing Places of the Aero Club of America, of which Rear Admiral Robert E. Peary, is Chairman, and Henry Woodhouse, Vice-Chairman, reported to the Executive Committee of the Club today that the committee has received a large enough number of offers from organizations and people who are ready to establish landing places for land aeroplanes and flying boats, to have a landing place on land or water at practically every mile from the center of New York to 100 miles away in every direction of the compass.

"The interest in aeronautics is tremendous," said Mr. Alan R. Hawley, the President of the Aero Club of America, today. "Older people are just as enthusiastic about the prospects of using aeroplanes for travel, sport and pleasure as the young men who have learned to fly for military purposes, and who are now ready to use aeroplanes for every purpose and are planning to use aeroplanes as they use automobiles, fast motor boats and yachts.

"The Army and Navy have trained about 20,000 college men to pilot aeroplanes and a large number of these men are well to do and find that they can use aeroplanes for travel and sport, and a number of them have already expressed their intention to purchase aeroplanes as soon as peace is declared.

"From the statements made to Aero Club of America officials it seems that a great many of the yacht owners within a radius of 100 miles of New York will have flying boats ranging from two passengers to twenty passengers in capacity. The Sound and Bay offer splendid places for air boating and it is expected that a great many of the business men who live on the Long Island, New Jersey and Connecticut shores will use flying boats and air yachts to fly to business instead of using the speed boats and yachts as they did before the war.

"By using flying boats and air yachts it will make it possible to save between two hours and three hours every day in going to and from New York. There will also be a number of people who will use land aeroplanes, the number depending on how near a landing place can be established for aeroplanes in New York City."

The report of the Committee on Landing Places of the Club states that the offer of the Automobile Club of America to establish a landing place for flying boats and air yachts at the foot of East 72nd Street can now be accepted. This landing place will be especially convenient to aeroplane owners because the Automobile Club garage is located at the foot of East 72nd Street and people arriving or leaving can put up or take out their cars at the garage.

The New York Yacht Club, the Columbia Yacht Club and Atlantic Yacht Club landings will also afford excellent landing places for air yachts. A number of landing places for air boats and air yachts have been offered to the Aero Club of America covering different points between the Battery and Spuyten Duyvil on both the North and East Rivers.

On Long Island Sound the landing places available are sufficient to accommodate thousands of aircraft, both on the water and on land.

The facilities for housing flying boats and land aeroplanes in New York are under consideration.

The most ambitious project for an aeronautic center is the plan of a group of prominent men of New York, Baltimore, Chicago and San Francisco to establish an aviation center at Lloyd's Neck, Long Island. Mr. Reginald C. Vanderbilt is President of this newly incorporated Lloyd's Neck Club, and Mr. Alan R. Hawley, the President of the Aero Club of America, is one of the directors. The Vice Presidents are Harry Payne Whitney, and Lawrence Lewis Gillespie. Their associates on the Board of Governors are C. Oliver Iselin, Edwin D. Morgan, Frederick N. Watriss, Elbert H. Gary, General T. Coleman du Point, Cornelius K. G. Billings, Leroy W. Baldwin, Frank C. Henderson, William Russell Grace, A. Kingsley Macomber, Arthur V. Davis, Roy A. Rainey, Nicholas F. Brady, William R. Coe and William Godby Loew. Mr. Watriss and Charles K. Beckman have worked out the necessary legal details of this club for national service.

The Lloyd's Neck Club property consists of 260 acres facing Long Island Sound a few miles from Oyster Bay and Huntington. It is about thirty-nine miles from the Queensboro Bridge, with fine roads for motoring leading to the point. On the property is a fresh water lake covering ten acres. The location for schooling and post-graduate work and hydro-aeroplaning is therefore ideal. A farmhouse on the property, together with portable barracks, will furnish comfortable accommodations for aviators.

The Committee on Landing Places at the Aero Club of America also submitted a list of offers of landing places in different cities throughout the United States, which includes the offer of a landing place at Jackyl Island, Georgia, made by Edwin Gould, and of an island near Portland, Maine, by Rear Admiral Peary.

THE NEWS OF THE WEEK

Ryan and Potter Resign

John D. Ryan has resigned his position as Second Assistant Secretary of War and Director of Aircraft Production. Correspondence made public by Secretary Baker shows that Mr. Ryan feels that his usefulness to the Government passed with the signing of the armistice, and that his duty lies in his former work in connection with the production and distribution of copper.

Mr. Ryan is President of the Anaconda Copper Company, the United Metals Selling Company, and the Montana Power Company. He was Director of many industrial enterprises and banks and of the Chicago, Milwaukee & St. Paul Railway when he entered upon war work in Washington.

In April of this year, when the aircraft activities of the army were reorganized, Mr. Ryan was made Director of Aircraft Production, and later he was made Second Assistant Secretary of War and Director of the Army Air Service.

Mr. Ryan's letter of resignation was as follows:

"DEAR MR. SECRETARY:

"With the signing of the armistice and the consequent reduction in the program of aircraft production, I believe my work here has become relatively unimportant. I have not taken over the actual direction of military aeronautics and my connection with it has not made any real change in its operations.

"I feel strongly that now the war is over my duty lies in the line of my former work. Labor and industry of the country must be quickly adjusted from a war to a peace basis, and the copper production is one of the most vital to the country's welfare. I believe I can do much in helping to bring about stable conditions, and that I should take up the work immediately. I therefore resign as Second Assistant Secretary of War and Director of Air Service, to take effect as soon as convenient to you.

"I desire to express to you my sincere gratitude for the opportunity given me to serve in the war. I have had at your hands the greatest assistance and encouragement in all the work I have had to do. I shall always prize the association with you and with the War Department.

"Sincerely yours,

"JOHN D. RYAN."

Secretary Baker's letter of acceptance follows:

November 22, 1918.

"MY DEAR MR. RYAN:

"I have just received your letter of November 21. Realizing the very great importance of the production and distribution of copper in the re-establishment of our national civilian industry, and your own antimation relative to this great business, I reluctantly acquiesce in your desire to return to it and to terminate your relations as Second Assistant Secretary of War and Director of Air Service.

"Your unfailing courtesy has been a source of great personal happiness to me, and your services to the country as Director of Air Service have been conspicuous; the sense of sureness and executive efficiency which your advent contributed to the air service made from the first a marked improvement in the entire prospect. The armistice, of course, has interrupted the constructive development of that great program. It had, however, advanced beyond the experimental stages, and even in so new an art as the air service America's contribution within a year and a half was substantial and would, in a short time, have been determinative.

"I shall set your own judgment as to the most appropriate time for the termination of your office, expressing only the hope that you will continue until the plans for contract cancellation and demobilization as sufficiently matured to allow those who are to carry them out to have definite and fixed principles for their guidance.

"Cordially yours,

"NEWTON D. BAKER.

"Secretary of War."

William C. Potter, Mr. Ryan's chief assistant, who has also resigned, is a banker, mining engineer, a railroad man, and was formerly General Manager of the American Smelting and Refining Company. He, too, is anxious to return to his private occupation.

Walter S. Gifford Resigns

Washington.—Brig.-Gen. Walter S. Gifford, Director of the Council of National Defense, has resigned to return to the American Telephone and Telegraph Company as comptroller of that organization, his services having been loaned the Government throughout the war period.

U. S. Fliers Destroy 926 Planes in War

When hostilities were suspended American aviators had destroyed 661 more German planes and 35 more German balloons than the Americans had lost. The total number of enemy planes destroyed by the Americans was 926, and the total number of balloons 73.

Two hundred and sixty-five American planes and thirty-eight balloons were destroyed by the enemy.

These statistics of the American air activities have been officially revealed to the Associated Press for the first time. The authorities now feel that the deeds of the American aviators should be made known, together with other information on this branch of the subject.

On November 11, the day of the signing of the armistice, there were actually engaged on the front 740 American planes, 744 pilots, 457 observers and 23 aerial gunners. Of the total number of planes, 329 were of the pursuit type, 296 were for observation and 115 were bombers. In addition, several hundred planes of various types were being used at the instruction camps when the war ended.

Between September 12 and November 11, the air forces operating with the First Army alone dropped 108,984 kilograms (about 120 tons) of high explosives on the enemy lines and supply depots and railroads behind his lines. It is not yet known what was accomplished on other portions of the front.

Wilson Tests Radio Phone

Washington.—Through a radio telephone installed on the south portico of the White House, President Wilson on November 22 directed the manoeuvres of half a dozen army aeroplanes flying over the Potomac River, several miles away. Mrs. Wilson and George Creel, Chairman of the Committee on Public Information, were the spectators, with a group of army officers, who conducted the installation of the aerial connected with a small field switchboard at which the President stood.

The planes in formation nose-dived several times and swung around a circle 1,500 to 2,000 feet above the ground. They were scarcely visible.

Several telephone receivers were connected to the switchboard and Mrs. Wilson and other members of the party were enabled to listen to the command as well as watch the execution. A single plane carrying a flight commander rose in the air first and flew up and down, dived and looped in accordance with the order telephoned from the ground. Then following directions the flight commander flew back to Bolling Field and in response to orders called upon his squadron to manoeuvre.

The telephone as used was adjusted for three to five or six miles. It is similar to the instruments used by American aviators in France, the secret of which was disclosed after the armistice was signed.

Plane Built to Bomb Berlin Carries Forty Passengers Over London

London—The Handlay-Page aeroplane set up a record in its flight when it took up no fewer than forty passengers for a trip over London. The previous record was twenty.

This giant machine is the first of a series that had been specially constructed to bomb Berlin, but it was not completed until three days after the signing of the armistice.

Takes 14 Passengers Mile in Air

Paris—Mr. Lorgnat, who inaugurated the London-Paris Aerial Postal Service in June, made an attempt for an altitude record to-day. With fourteen passengers in his machine he ascended 1,425 metres (about 5,300 feet), when the attempt had to be abandoned because of a rainstorm. The flight consumed an hour and fifteen minutes.

To Find After-War Work for Aeroplanes

Paris—The French Government is studying a proposition for about twenty aerial lines connecting Paris with the chief towns of France and the great foreign centers.

Open Club for Air Service Officers in Paris

Paris.—The latest link in the chain of relief work in Paris is the Aviation Officers' Club, which has been provided with a home by Louis Beaumond, who has granted his Pavilion de Lysee. This has been equipped for the use of American aviation officers.

The foreign service committee of the Aero Club of America, composed of Ambassador William Graves Sharp, honorary chairman; Laurence V. Benet, John Weare, Robert Woods, Bliss Williams, H. S. Weit, Major E. L. Gross, Major William Thaw, Dr. A. L. Hipwell, Raymond Price, and G. F. Campbell, is placed in control of the club. M. Beaumond will also be an active member of this board of control.

The club will be open to aviation officers visiting Paris, and will be a social center for the men in the air service and their allied colleagues for fraternal reunions. It will be open from 8 A. M. till 11 P. M. There will be no dues or initiation fees. The building is well equipped for use as a clubhouse.

Marries Army Aviator

Boston.—Announcement is made of the marriage of Miss Katherine Register to Geraldyn L. Redmond, air service, U. S. A., at the home of Mrs. E. P. Simmons, the bride's grandmother. Mr. and Mrs. Albert L. Register, parents of the bride, live in Philadelphia.

President Wilson, with Mrs. Wilson, General Peyton C. March, and Mr. John D. Ryan, interested in some of America's aeroplanes in a park in Washington

Danish Prince Is Here on Aeronautic Mission

With a party of prominent Danish aeronautical experts Captain-Commander in the Danish Navy, Prince Axel of Denmark, is at present the guest of the U. S. Navy and is touring the country inspecting the U. S. war industries, in particular the aircraft industries.

Prince Axel, who is cousin to the King of Denmark, became an aviator so early as in 1912 and obtained in February, 1913, the international certificate granted by the Aero Club of Denmark as No. 10.

Over here the Prince is accompanied by Captain-Commander J. Corbing, Director of Construction of the Royal Danish Shipyard; Lieutenant-Commander W. Laub, Chief Pilot of the Danish Naval Air Service, and Lieutenant-Commander A. Thiele, Naval Aviator.

In the homeland of Prince Axel—as in the other Scandinavian countries, Sweden and Norway,—aviation has, in spite of the war, been developed on a peace time basis quite extensively.

On April 26th and 27th this year an Inter-Scandinavian Conference on aviation was held in Stockholm, presided by the Swedish Crown Prince. Here delegates from the aero clubs of the three countries planned lines for aerial transportation and discussed judicial problems regarding aviation.

In May an Inter-Scandinavian Aeroplane and Motor Exposition was held in Christiania and Swedish, Danish, and Norwegian aeroplane manufacturers exhibited here more than a dozen of different types of full equipped flying machines.

In each of the three countries large corporations for aerial transportation has been established and mail and passenger between the capital cities will start operation next summer.

Unquestionably therefore the observation of the capacity and the achievements of the U. S. aircraft industries must be valuable and inspiring to the Danish visitors and to the aviation in their homeland.

Roosevelt Touched by French Sympathy

Paris—Henri Rouselle, Vice-President of the Municipal Council of Paris, has made public the following message received from Col. Theodore Roosevelt replying to a cablegram of condolence on the death of Lieut. Quentin Roosevelt:

"I am profoundly touched by the cablegram you sent me in the name of the Municipal Council of Paris. I thank you for your sympathy. The death of our son is a bitter affliction, but this affliction would have been more bitter if our boy had not had an ardent desire to face death for such a noble cause. You will not forget that he was given the name of a French ancestor who left France 225 years ago."

Two Aviators Liberated

When the Americans entered Longwy they found in a hospital there two American aviators, Vernon Remington and Arthur C. Dineen, who were captured in October.

Remington was a member of a second pursuit group, and Dineen, whose home is in Huntington, Ind., belonged to the 91st Squadron. The aviators were brought down within the enemy lines in the week of October 22. Their fate was not known and they were reported by their organizations as missing.

Plane Flies with 35

Paris.—A huge aeroplane, carrying thirty-five passengers, flew over Paris yesterday.

The machine started from Combes la Ville, forty miles from the capital, and returned without a hitch.

British Had "Flying Tanks"

London—"Flying tanks" are war's newest implement. They are armor-plated scout planes. Invulnerable against ordinary ground fire, capable of climbing quickly and of developing remarkable speed, and designed almost entirely for the most demoralizing of any kind of warfare—ground-strafing.

These machines can accomplish the maximum amount of damage with the minimum amount of danger to both pilot and plane. They caused great havoc among the retreating German forces in France.

Detroit S. A. E. to Hear Wardrop

Detroit.—The Detroit Section, Society of Automotive Engineers, will hold its regular meeting at the Hotel Pontchartrain convention hall November 29. A government film, "Process of Manufacture of the Liberty Engine," will be shown, after which G. Douglas Wardrop, managing editor of AERIAL AGE WEEKLY, who has just returned from France, will deliver a lecture on "The War in the Air."

Student Aviators Can Quit or Stay

Washington.—All cadet aviators now in training in the United States will get the option of immediate discharge without commissions or of completing their training. Instructions to this effect were sent to all aviation fields and camps by Major Gen. Kenly, Chief of the Division of Military Aeronautics.

Cadets who elect to complete their training will be discharged when they finish the course with commissions as Second Lieutenants in the Officers' Reserve Corps. Candidates for commissions at balloon schools also will get a similar opportunity to complete their training.

Orders have been issued for the closing of Selfridge Field, Mount Clemens, Mich.; Chanute Field, Rantoul, Ill., and Scott Field, Belleville, Ill., and for the abandonment of the Air Service Mechanics' School at St. Paul.

Demobilization of the army air service presents a separate problem, on which War Department officials now are at work. Secretary Baker is known to regard the air service as the field of military enterprise in which the greatest developments are to be expected, and the army programme to be laid before Congress probably will recommend large allowances for it.

Provision also will be made for retaining officers and men who have displayed marked ability in the aircraft field.

Outstanding contracts for military planes of various types are understood to total between 25,000 and 30,000.

It is to new types that chief attention will be given by the Government. In addition to the manufacturing monopoly, which includes assembling of scientific data of the utmost value on the whole question of air flight, the Government has complete monopoly over the training facilities for flyers. Home aviation schools are fitted to turn out 2,000 men a month, rated as reserve military aviators, while there now are more than 12,000 men who either have passed through that school system or are nearing completion of their training.

In the opinion of many officials, the future of air navigation in the United States rests largely with these men trained to fly by the Government. Having had a taste of air work, it is believed the majority will wish to continue flying. For the time being, however, the Army and Navy services, supplemented by the aerial postal service, will be the only outlet for the product of such an industry.

Prince Axel, of Denmark, on a visit to the Curtiss Aeroplane & Motors Co., Buffalo. From left to right: Mayor Buck, Prince Axel, Mr. Kepperley, Captain Andrews, Lieut.-Comm. W. Laub, Captain-Comm. Corbing, Lieut.-Comm. Thiele, Buffalo City Officials and Curtiss Engineers

Liberty Motor Tests

The following statement is authorized by William C. Porter, Acting Director of Aircraft Production:

The British Air Mission have handed me a cable from London, dated September 26, from the British Air Ministry, reading as follows: After 100 hours flying, one engine (Liberty) was stripped and found to be in very good condition. Tests have been made in the DeHaviland 9-a and DeHaviland 10 machines. Engines have performed uniformly satisfactory in these tests.

Information expressed officially four months ago to effect that engine would prove satisfactory in service fully confirmed.

Dayton Aero Club Will Reorganize

Steps will be taken shortly to rejuvenate the Aero Club of Dayton, increase the membership roster and take on a more active existence. Club officers are of the opinion that the government will continue considerable aeronautical activity in Dayton and that this city should maintain a large and active aero club to foster aeronautical activities and perpetuate the memory of the Wright brothers. Dr. L. E. Custor is president of the organization which is affiliated with the Aero Club of America.

Airmen Decorated

First Lieutenant Frank Baer, as S. R. C. Pilot, 103d Aero Pursuit Squadron—"For the following repeated acts of extraordinary heroism in action five, April 12 and 23, May 8 and 21, 1918, Lieutenant Baer is awarded a bronze oak leaf to be worn on the distinguished service cross awarded him April 12, 1918. Lieutenant Baer brought down enemy planes on April 5, April 12, and on April 23, 1918. On May, 1918, he destroyed two German machines, and on May 21 he destroyed his eighth enemy plane."

Next of kin: Mrs. Emma B. Dyer, mother, 1304 Maud Street, Fort Wayne, Ind.

First Lieutenant Wallace Coleman, pilot, Observation Group, Fourth Corps. "For extraordinary heroism in action near Jaulny, France, September 12-13, 1918. On September 12 Lieutenant Coleman, with Second Lieutenant William Belzer, observer, while on an artillery surveillance mission, was attacked by an enemy plane. They waited until the enemy was at close range, fired fifty rounds directly into the vital parts of the machine, when the machine was seen to disappear out of control. The next day Lieutenants Belzer and Coleman while on a reconnaissance mission were attacked by seven enemy aircraft. They unhesitatingly opened fire, but owing to their guns being jammed, were forced to withdraw to our lines, where, clearing the jam, they returned to finish the mission. Their guns again jammed, and they were driven back by a large patrol of enemy planes. After skillful manœuvring they succeeded in putting one gun into use and returned a third time, only to be driven back. Undaunted, they returned the fourth time and accomplished their mission, transmitting valuable information to the infantry headquarters."

Home address, R. B. Coleman, father, 1625 Boyd avenue, Racine, Wis.

Second Lieutenant William Belzer, observer, Observation Group, Fourth Corps. "For extraordinary heroism in action near Jaulny, France, Sept. 12-13, 1918. He accompanied and aided Lieutenant Coleman as told above."

Home address, Frank B. Belzer, Glasgow, Mont.

First Lieutenant William Duckstein, pilot, First Aero Squadron. "For extraordinary heroism in action between Montrebeau and Exermont, France, Sept. 29, 1918. While on a special command reconnaissance to ascertain whether or not there was any concentration of enemy troops between Montrebeau and Exermont, which might indicate a possible counter-attack, this officer obtained information of the very greatest value. Flying over the enemy's line at an altitude of less than 200 metres, in spite of most unfavorable atmospheric conditions, in the presence of numerous enemy aircraft, and under continuous heavy rifle and machine gun fire from the ground, Lieutenant Duckstein spotted enemy troops massed for counter-attack, and although severely wounded by a machine gun bullet from the ground, continued his mission until he had clearly and accurately located the position. He then returned, and though suffering from the pain of his wound, succeeded in writing out and dropping a clear and complete message. The counter-attack launched shortly afterward by a fresh enemy division we crushed, and the accurate and timely information brought back by Lieutenant Duckstein after a very gallant flight under highly adverse conditions, was of the greatest importance in this success."

Home address: Mrs. A. W. Duckstein, wife, Wardman Courts, West, Washington, D. C.

First Lieutenant Alan Nutt (deceased), pilot, Ninety-fourth Aero Squadron. "For extraordinary heroism in action near Forges, France, Sept. 26, 1918. While on a patrol Lieutenant Nutt encountered and unhesitatingly attacked eight Fokker planes. After a few minutes of severe fighting, during which he displayed indomitable courage and determination, this officer shot down one of the enmey planes. Totally surrounded, outnumbered, and without a thought of escape, he

continued the attack until he was shot down in flames near Drillancourt."

Next of kin: Robert H. Nutt, Cliffside, N. J.

Second Lieutenant Percival G. Hart, 135th Aero Squadron.—"For extraordinary heroism in action during the battle of the St. Mihiel salient, Sept. 12-13, 1918. On Sept. 12 he made three infantry liaison patrols and obtained valuable information of the location of our advancing line, which information he conveyed to organization commanders. Bad weather conditions necessitated flying at a very low altitude, but, in spite of this and repeated attacks by superior numbers of enemy aircraft, he drove them off by his accurate fire and accomplished his mission. On Sept. 13 he unhesitatingly went to the assistance of three allied planes which were being attacked by a large patrol of the enemy and by his steady fire drove off the enemy patrol and enabled the three allied planes to return."

Home address: D. M. Hart, father, Chicago, Ill.

Citation for Bravery

Col. (Brig.-Gen.) William Mitchell, Chief of Air Service, First Army.—For repeated acts of extraordinary heroism in action at Noyon, France, March 26, 1918; near the Marne River, France, during July, 1918, and in the St. Mihiel salient, France, September 12-16, 1918. For displaying bravery far beyond that required by his position as Chief of Air Service, First Army, American Expeditionary Forces, setting a personal example to the United States aviation by piloting his aeroplane over the battle lines since the entry of the United States into the war, some instances being a flight in a monoplane over the battle of Noyon on March 26, 1918, and the back areas, seeing and reporting upon the action of both air and ground troops, which led to a change in our aviation's tactical methods; a flight in a monoplane over the bridges which the Germans had laid across the Marne during July, 1918, which led to the first definite reports of the location of these bridges and the subsequent attack upon the German troops by our air forces; daily reconnaissances over the lines during the battle of St. Mihiel salient September 12 to 16, securing valuable information of the enemy troops in the air and on the ground, which led to the excellent combined action by the allied air services and ground troops, particularly in this battle.

La Guardia Resigns Army Commission

Washington.—Major F. H. La Guardia, who commanded the American air forces in Italy, has resigned his commission in the army to resume his Congressional duties.

Witness Flies To Court

The first witness to fly to court in an aeroplane dropped out of the sky at Mineola, L. I. Lieut. John Kelly winged over from Brindley Field, Commack, L. I., to testify before Justice Scudder in the Supreme Court in the divorce action brought by Mrs. Laura Kelly, violinist, against Lou Kelly, vaudeville actor. Lieutenant Kelly landed in front of the court house and, after testifying, took the air again and returned to Commack.

Decision Concerning Inducted Men

The following order to chiefs of all staff corps and departments has been issued by the Adjutant General of the Army:

1. The Secretary of War directs that you immediately take necessary steps to cause the honorable discharge for the convenience of the government, quoting this letter as authority, of all men whom you have caused to be inducted into the service with a view to being commissioned. Travel to the original points of entrainment is directed as necessary in the military service. In all cases where recommendations for appointment of such men have been forwarded by you, you will request by special messenger return of papers from the Personnel Branch, General Staff, Room 597.

If doubt exists as to whether or not appointment has been made in any case, request for papers will precede any other action by you.

Upon receipt of notification of discharge in each case you will send complete papers to The Adjutant General, Room 463, for file.

To Chart Air Lanes

The War Department authorizes the following:

Beginning Friday, November 22d, Army planes from flying fields in various parts of the United States will start a series of cross-country flights to cities in their sectors to chart air lanes, make air maps and gather valuable air statistics. Incidentally they will locate sites for landing fields and airdromes: the landing fields to become part of a great chain that soon will "air link" every important community in the country from coast o coast; the airdromes in addition to offering shelter to visiting flyers, to be made available if needed in helping to house the equipment the Air Service will bring back from overseas. This reconnaissance work will be gradually extended as fast as arrangements can be made.

An important part of this work by the Air Service is bringing up to date the records started years ago by the cavalry, which by cross-country rides made extensive maps for future emergencies, showing all avilable shelter, battery locations, good roads, bad roads, fords, safe bridges, poor and plentiful sources of water and food supplies.

Then the cavalry was the eyes of the Army. Today the airplane takes the cavalry's place, and to operate successfully in the air, squadron commanders must know their sky routes as cavalry leaders knew the turnpikes and highways. As the horsemen needed water and forage, so the air pilots use gas, oil and landing fields. Without landing fields under him and without charted lands through the sky, the flyer today is just as much up against it as the pathfinder of colonial times blazing a trail through a trackless forest.

The flyers who start this air map making campaign Friday are combat pilots trained in the United States for fighting overseas and whose battle training has, by the armistice, been turned to account in preparing for the times of peace.

Major General Kenly, Director of Military Aeronautics, has placed in charge of this immense reconnaisance work Colonel M. F. Davis, head of the Training Section and an army officer who saw his first field service on the plains with the First and Fourth Cavalry, and who has ridden horseback all three historic trails across the continent—the Lewis and Clark, Oregon and Santa Fe.

On a War Basis

The gasoline-less Sunday order didn't worry Glenn L. Martin, the aviator and head of the Glenn L. Martin Company, of Cleveland. Mr. Martin, remembering some of the devices used in Europe to save gasoline in the running of motor cars, had the Goodyear Tire & Rubber Company make up for him a huge gas bag, which he installed on the top of his brougham.

This he filled with regular fuel gas and then ran his machine about the streets of Cleveland and elsewhere quite unconcernedly, serene in the knowledge that he was not violating the Government's gasoline order and happy in the further belief that he was making a suggestion that might well be followed by car owners generally for the conservation of gasoline.

In a letter to Goodyear Mr. Martin says: "The gas did its work well. It was installed on a Saturday afternoon, and Sunday I drove down through the streets of Cleveland, going about my work in general and filling the bag three times during the day.

"We have had dozens of inquiries from men wanting more information about the use of gas for automobiles and from any numbers of inventors who have methods for improvements of mileage and convenience with gas and coal oil and many other substitutes, which would indicate that the American populace is patriotic enough to want to do most anything if the Fuel Administrator is still of the opinion that there should be a decided saving of gasoline."

Goodyear's experience in building airships, observation and spherical balloons, covering a number of years, brings the company a great many requests for experimental devices. It may be said of Mr. Martin's request that it worked finely, taught a patriotic lesson and has caused much activity among the inventors.

Colonel Archie Miller Flies to Washington

Colonel Archie Miller, the popular commander of the numerous aviation fields on Long Island, on November 1 flew to Washington, covering the distance in 2 hours and 40 minutes. Lieutenant J. J. Redfield piloted the plane.

Aeroplane Uses After the War

London.—The more obvious uses of the aeroplane after the war, as carrier of passengers and mails, are likely to be supplemented by several others, which may appeal more than the ordinary routine to many British pilots who will like to use their skill in the spread of the civilization they are now fighting to preserve.

For such men Canada, Africa, Australia, India, South America—any country of great and sparsely populated areas—will be the future field of operations. Forest and bush fires, for instance, cause vast destruction before they are detected, and an immense waste of natural wealth is caused which could be minimized, if not entirely prevented, by setting up aeroplane patrols, with headquarters in townships to which pilots could report by wireless the outbreak of fire as soon as it occurs in the region under patrol.

The world can afford no waste of its resources, and the aeroplane which saves a forest from destruction is serving civilization in the most practically effective way.

Aeroplanes can carry first aid to famine or disease smitten districts, conveying doctors and light hospital requisites; and in the case of pests to crops information can be disseminated of the means of destruction. Loss through ignorance can be avoided.

The observer who from the skies can detect the presence of a submarine under water and follow its course can spot a shoal of fish and the direction taken by the shoal, and can report by wireless to harbor or to the fishing fleet at sea. The harvest of the sea can be very greatly increased by the use of the aeroplane.

The aeroplane will serve railway construction. It may some day supplant the railway, but meantime, in the important matter of railway survey in difficult country, aerial photography will replace the hardy pioneer who hewed his way through trackless forest, only too often to discover that a railway was impracticable. There will be no such costly mistakes after a survey by aerial photography.

Rubber can be "spotted" from the air; and nobody supposes that the known areas of wild rubber exhaust the world's natural supply, and so with other valuable trees, like mahogany.

The prime fact about the aeroplane is that it annihilates remoteness, and from that springs an infinite variety of ways in which the air can be exploited in the service of humanity.

A Blimp maneuvring around the Woolworth Building in New York City

The AIRCRAFT TRADE REVIEW

Government to Retain Control of Steel Prices

Washington.—In accordance with the expressed wishes of steel producers at the first Reconstruction Conference of the War Industries Board held November 12, the Government will continue for the time being the regulation of the sale and distribution of steel.

It was felt that this course was desirable in order to insure against the possibility of disturbance to the steel industry or to other industries in which steel plays an important part. An informal statement was issued jointly after the meeting of the chairmen of the War Industries Board and of the American Iron and Steel Institute. This was to the effect that the general discussion had the main purpose of preserving industrial stability, and that it was characterized by a spirit of co-operation and that further data and information would be collected for the use of further conferences.

Liberty Engine Builders Form Association

Indianapolis.—The men and women building Liberty aeroplane engines have formed an association in which they pledge themselves to use every effort to keep production at its topmost point. Following the unveiling of a 10,000th motor at Detroit three weeks ago, the United States Liberty Motor League was formed. It now has a membership of over 25,000 workers, in some 600 plants, making Liberty engines and Liberty engine parts, and every day finds thousands more applications.

To Discuss Problems of Reconstruction

Washington.—Preliminary plans for the War Emergency and Reconstruction Conference of War Service Committees to be held at Atlantic City, December 4, 5 and 6, are announced by the Chamber of Commerce of the United States.

Reconstruction will be given a prominent place on the program, as it is recognized this subject must be taken up by business men to the end that there may be placed at the command of the Government all available sources of information. The work of reconstruction suggests the creation of a federation of all war service committees that whatever study and planning is carried on may be on behalf of all business. War industries and non-war industries are concerned equally in the determination of reconstruction problems. All European countries already are under way with reconstruction plans.

The Atlantic City conference, a call for which was sent out last week by the War Service Executive Committee of the Chamber of Commerce of the United States, will include four general sessions and numerous group and committee meetings. Into the final session will be brought for final action all the proceedings of the meetings.

There will be four general sessions participated in by all the delegates. On December 4 there will be both morning and afternoon sessions, and on the 5th and 6th morning sessions. The chamber is engaged now in obtaining the best speakers available to discuss among others the following suggestions: Reconstruction, industrial relations, raw materials and their control, price control, economic legislation affecting combinations, export and import operations, finance, etc.

The conference will be divided into groups at three sessions, the first to be held on the evening of December 4, the second on the afternoon of December 5, and the third on the evening of the same day.

On the evening of December 4 each war service committee will meet with its chairman to consider the problems of reconstruction as they affect that particular industry, as well as to take up other problems which the war has demonstrated are vital to industry.

On the afternoon of December 5 the war service committees will meet in groups which are related as to their use of basic materials and as to their distribution problems, etc.

With these groups will meet the commodity or section chiefs of the War Industries Board. Related groups will form themselves into ten major groups on the evening of December 5 to take up the question of raw materials, price control and subjects arising from related group meetings.

After the general meetings of the committees of the related groups and of the major groups it is hoped there will be presented definite recommendations covering the reconstruction period, with the possibility of creating an executive committee empowered to gather data and to function with industries to meet the many problems that the nation's industries will be called upon to solve with the end of the war.

$75,000,000 Worth of Aeroplane Contracts Cancelled

New York.—Government contracts for training and fighting planes amounting to approximately $75,000,000 and held by the Curtiss Aeroplane & Motor Corporation, Buffalo, have been cancelled. Late last week the company discharged 6,000 of its men. The cancelled contracts cover almost entirely orders for JN-4 training planes, an order for SE-5 fighting planes, which is understood originally to have been for 1,000 and is now cut to 250 or approximately the number for which the company has parts on hand; the USB, the De Haviland 9 for the army, the HS-1 and the F-5 for the navy.

About the only government contracts which remain include orders for 144 training planes, 60 large flying boats and about 75 smaller boats. It seems likely in view of these cancellations that it may be necessary for a large part of the Buffalo plant to be shut down. Rumor has it that the Churchill plant may be used for the production of the new $500 Overland car. Nothing official, however, has been given out.

S. A. E. Winter Meeting Jan. 12-14

New York.—The Society of Automotive Engineers' winter meeting has been definitely placed on the calendar for January 12-14, and is to be held in the auditorium of the Engineering Societies Building, New York. The "Carry Through Meeting" will be brought to a close with a "Victory Dinner" which is to be held at the Hotel Astor.

The meeting will be almost entirely devoted to war and post-war matters, and it is expected that the program of speakers will be of unparalleled interest because of the great events which have been taking place and because a number of men usually diffident about appearing in public have consented to address the sessions.

The views of many men who have been engaged abroad with our Army or that of our Allies will be given. There has never been a time when members of the S. A. E. were more actively engaged in professional work in so many lines of national importance to the world and to the automotive industry. The time is at hand to acquire broader views and entirely new conceptions of engineering subjects.

A number of matters relating intimately to the automotive industries which it is planned to cover include fuel, thermo-dynamics of the internal combustion engine, carburetion, including the use of heavy fuels and apparatus designed to compensate for variations in atmospheric density, etc. Tanks, types of post-war automobiles, radial-type aeronautic engines, relation in plane design of performance to weight, power and location of engine, and farm and road tractors will be discussed.

The recent intensive work in aircraft engines will be discussed and the lessons to be learned therefrom in automobile practice considered. The development of motor patrol boats will be covered as well as important features of stationary and farm engines and motorcycles for delivery and messenger service.

Victor Company Makes Plane

The first scouting hydro-aeroplane made from parts manufactured by the Victor Talking Machine Co., of New Jersey, has had a successful tryout. The test showed the machine is capable of turning in a remarkably small area.—*On the Wing.*

The Service Flag now flying over the Standard Aircraft plant in Elizabeth contains 286 stars, while the flag over the Plainfield plant of the Company shows 64 service stars.

At a meeting of a Reorganization Committee of the Standard Aircraft Club at the plant of the Standard Aircraft Corporation, in Elizabeth, New Jersey, the following nominations for office were unanimously made:

President—Mr. Charles Lindblum.

First Vice President—Mr. Albert Johnson.

Second Vice President—Mr. Clifford Hamblin.

Recording Secretary—Peter Hoffman.

Treasurer—Mr. Thomas Killea.

Trustees—Mr. G. M. Anderson, Mr. Wm. Knaus, Mr. Alex. Milne.

Chairman of House Committee—Mr. Wm. Tynan.

The Standard Aircraft's new Club will shortly be finished and the following Committees were appointed to take charge of the opening event:

Chairman Reception Committee—Mr. E. E. Pennewill.

Chairman Arrangements Committee—Mr. G. M. Anderson.

Chairman Music Committee—Mr. Kettley.

Chairman Decoration Committee—Mr. Wm. Dornan.

Officers and engineering staff of the Standard Aircraft Corporation at a factory get-together luncheon

Navy Starts New Aero Mail Service

An aerial mail route between the battleship fleet stationed at Hampton Roads and the Navy Department was inaugurated November 16th by one of the "flying fish" in the naval service. The air route was designed for the transmission of the official mail.

The plane, piloted by Lieutenant Jacobs and Ensign Devidson, flew the 200 miles in one hour and fifty-two minutes. Within eight minutes after the plane landed on the river at the naval air station, the mail was in the hands of Secretary Daniels, delivery from the air station being made by a fast motor boat and automobile.

A return trip to Hampton Roads was made at 1 o'clock today, and at the same time a second plane was scheduled to leave Hampton Roads with mail for Washington. Daily mail service in both directions will be maintained.

The planes used in this service are the standard machines of the navy service. They are eighty-six feet across, from wing tip to wing tip, and are powered with a 400-horsepower Liberty motor. Fuel tanks with a capacity of 200 gallons furnish gasoline for a five-hour flight. These ships are not equipped for ground landings, consequently all flights follow water courses, so that forced landings can be made without damage to the plane. The mail planes follow the Potomac River to Washington.

Allen Adams Not Aerial Mail Aviator

Allen Adams, the aviator who was killed recently while flying an L. W. F. machine, was *not* an aerial mail aviator, as was reported in the press.

He was flying an L. W. F. to demonstrate it to the postal authorities, and was killed during the flight, before arriving to Belmont Park.

Seek $1,500,000 for Air and Motor Truck Mail

Washington—The Post Office Department is planning to ask Congress soon for at least $1,500,000 to be used in expanding the aeroplane and motor truck mail service into every section of the United States. This will provide a future for the trained aviators and motor truck operators now in the army service and prevent the loss of millions of dollars invested in aeroplanes and army trucks, besides giving more rapid mail communication between remote sections of the country. In addition it is desired that the funds appropriated by Congress be in the nature of revolving funds, with 50 per cent. of the profits to go toward making better roads and the other 50 per cent. to go toward maintenance of the service.

With $1,000,000 it is planned, according to semi-official reports, to employ as soon as the army can release them in the neighborhood of 20,000 motor trucks to be operated annually.

Another $500,000 will be devoted to 500 to 1,000 single motor aeroplanes—probably many more—for establishment of air lines. Eventually it will be possible to send mail direct by air from New York via Chicago and Denver to San Francisco; from New York to Atlanta, Ga., Jacksonville, Fla., and New Orleans, La.; from New Orleans to San Francisco, Washington to Detroit and Washington to St. Louis, until the entire country is linked up by air.

Aerial Mails from Australia

Cable messages from Sydney state that a local company has been formed with the object of arranging the preliminaries for an aerial mail service between Australia and England. At a meeting in Sydney, on October 2, of representative business men, it was stated that the flight would take 150 hours, and sufficient capital was guaranteed for the purpose, provided that permission was obtainable.

Peace Will Boom Aero Mail Service

Washington.—The Post Office is going to take up the aircraft program where the army and navy drop it. Plans have been worked out by which every aircraft that can be spared from military service may be put to work carrying mails instead of bombs. If these plans carry, practically the entire first class mail of the nation will travel through the air.

The Washington-New York aerial mail, which many regarded as a mere spectacular by-product of the war, has been successful. Not only will the carrying of letter mail be expedited, but the aero service will be a paying department of the Post Office, statstics show.

They also show that mail from New York can be landed in Chicago in nine hours against the twenty-three it takes by the fast trains, and against the four days it takes to get a letter from the Atlantic to the Pacific the aero mail will give a delivery in less than forty-eight hours.

It is expected that the aero letter service will almost entirely supersede the night-letter telegraph between cities within a radius of 500 miles. It will be cheaper; there will be no limitation on the number of words and the danger of errors of transmission will be done away with.

It is understood the extent of the new system will be limited only by the demand for its use. This means that hundreds and perhaps thousands of planes will be in constant service, and likewise that landing places must be provided and repair stations be established in or near every big city.

The Post Office program also answers the question "What is to become of the flying men when the war has released them?" There are 7,000 young men who have received more or less training. If the program goes through, there will be use for all the men the military branches can spare.

Spain-U. S. A. Aerial Mail Service

It is reported from Madrid that Captain Herraro, chief of the Spanish Air Service, has had several interviews with King Alfonso on the subject of aerial services between Spain and America. The scheme is also said to have been discussed at Cabinet meetings, and a shipping company are willing to finance it. The plan, it is understood, is to use large machines capable of carrying 40 passengers besides mails, and the fare suggested is $400 and a rate of 25 cents an ounce for letters.

Max Miller, left, and Edward V. Gardner, right, two of the pioneer Aerial Mail Pilots

THE BREGUET BIPLANE

IN a German technical journal, the automobile and aerotechnical paper "Der Motorwagen," an extensive description of the Bréguet 14 B2 biplane, with 300 h.p. Renault engine, is to be found in the issues of July 30th and Aug. 10th.

The Wings

This biplane, characterized by two sets of struts, is produced almost exclusively of aluminium, and is intended for bombing purposes. The upper planes have a backwards stagger of 0.21 m. and a span of 14.4 m., and are mounted on a cabane frame, while the lower planes have a span of 13.77 m.

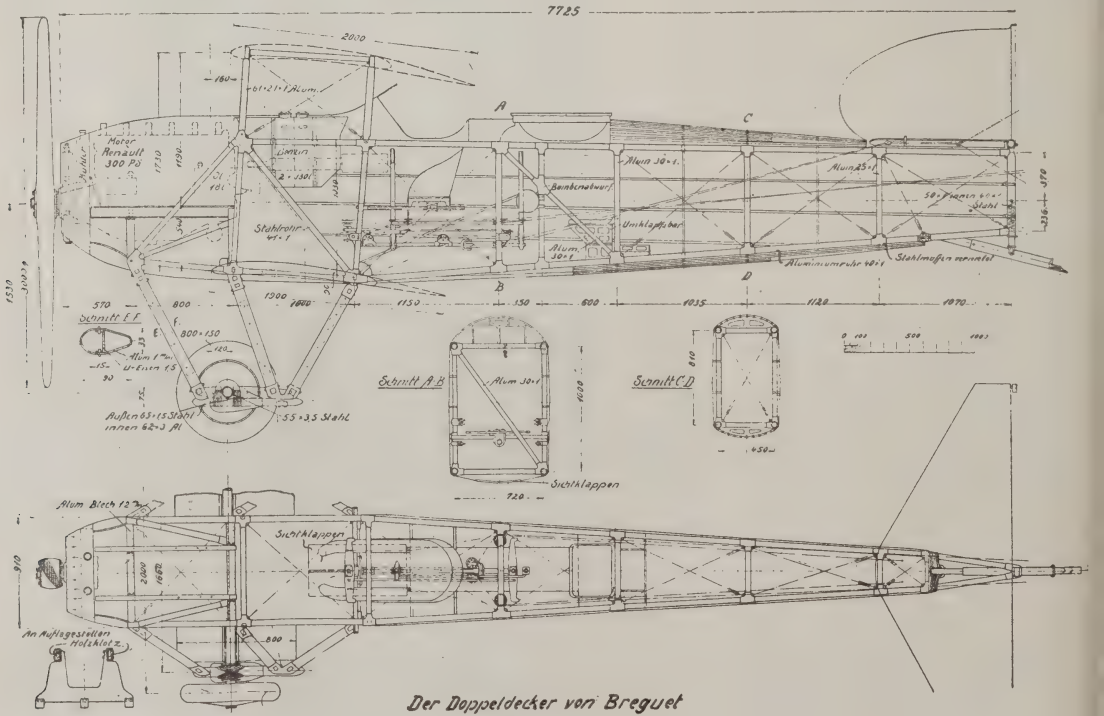
Both upper and lower planes have large cuttings at the fuselage and their arrow shape amounts to 175 deg. The angle of incidence of the upper planes is 4.5 deg. in the middle and 2.5 deg. at the ends, that of the lower ones decreasing from 3 deg. to 2 deg.

The spars of both planes are drawn aluminium tubes of rectangular section 65.6 x 34.6 mm. The thickness of the walls of these tubes amounts in the inner section of the upper plane to 2.6 mm., elsewhere to 1.6 mm. The rear spar grows thinner towards the wing tips till the thickness of the edge, where auxiliary spars with ash bands of 6 mm. thickness and 3 mm. three plywood glued to both sides are provided. At the points of juncture and at the ends of the stampings the spars are strengthened by ash pieces, in some instances of I shape. A socket of 20 cm. length, made of welded sheet steel of a thickness of 1.5 mm., is provided at the strut ends of the upper planes and at the strut bases. These sockets and the wooden linings are held in position by iron tube-rivets.

The main spar of the upper plane is strengthened in the interior section of a pine support of a thickness of 10 mm. being fixed to one side of the spar by means of small brass screws. The spars of the upper planes are equipped with compression supports at the joints of the two sets of struts and the lower planes for the outer strut set, the support being an aluminium tube of the diameters 30 and 27 mm. exterior and interior. Further there are two aluminium ribs of a width of 40 mm., one at the beginning of the ailerons and one by the bomb store in the lower plane. The interior wiring consists of single wire.

The ribs are very strong. They have a depth of 2 mm. above, of 1.9 below. A web provided with weight diminishing holes in glued between the longtitudinals of three-ply wood, 3 mm. thick. On both sides of the spars as well as at five points between them the flange is strengthened by glued and nailed birch laths and wrapped bands. The ribs are arranged loosely on the spars. The ribs lie parallel to the axis of longitude, forming in relation to the spars an angle corresponding with the arrow shape. They are connected with each other by means of the veneer planking, reaching on the upper side from the leading edge to the main spar, as well as by the leading and trailing edges. Further they are connected by two bands, lying behind each other and alternately wound from above and below the ribs. The distance between them amounts to 40 mm. Forward and in front of the rear spar more 4 mm. thick auxiliary ribs of plywood are arranged. To reinforce the aerofoil, thin birch ribs reaching to the trailing edge are screwed to the rear of the ribs on the underside.

The yellow-white colored fabric is sewed to the ribs and secured with thin nailed strips where exposed to the airscrew draught. The provisions of hooks and eyes on the under side of the planes behind the leading edge and in front of the trailing edge is to permit the draining off of moisture.



ailerons, attached direct to the rear spar.

The part of the lower plane lying behind the rear spar is hinged along its total length and is pulled downwards by means of 12 rubber cords fixed on the under side of the ribs, the tension of these can be adjusted by means of screws, an automatic change of the aerofoil corresponding with the load and speed thus results with an easier control of the aeroplane with and without a load of bombs. The stampings for the hinges of the ailerons and the flexible lower plane pieces embrace the spars and are connected with them by means of bolts passing right through. The spare have no linings at these points.

The construction of the stampings of the spars is very simple. Several sheet steel pieces with corresponding angle pieces are fixed to the spars with two screws penetrating them.

The interplane struts are made of streamlined aluminium tubes with aluminium sockets in both ends. The inner struts are further strengthened by the insertion of riveted U irons. The aluminium employed has a strength of 40 kg. per sq. mm. with a stretching of 18 per cent. The bending figure is 1—2.

The 4.5 mm. thick load-carrying cables are double, the space between them being filled by a wooden lath. In the same manner the landing wires as well as those crossing from the upper planes forward

Der Doppeldecker von Breguet
Typ 14. B. 2.

Factory assembly of Breguet Biplanes

and backwards of the fuselage are arranged, being wires of a thickness of 2½ mm. that are connected with the stampings and the turnbuckles in a primitive way by means of eyes and spiral wire pushed over. To give a better support to the lower planes, being much stressed by the bomb store, the load-carrying cables are in the inner section led to the stamping on the main ribs arranged by the bomb store, and thence downwards to the landing gear. The rear spar of the upper planes is also provided with a cable to the fuselage between the cabane and strut.

The stampings for the fixing of the wiring is constructed very simply. A bent sheet metal of U form and with drilled holes for the bolts carries the nipples of the eyebolts.

The Fuselage

The canvas-covered body consists almost exclusively of aluminium tubes that are riveted with welded steel tube sleeves and spanned with wire. Only at specially stressed points in the front part have steel tubes been employed. The upper and lower sides of the fuselage are rounded by the employment of fairings.

The engine rests on aluminium U bearers that are supported by riveted aluminium struts. Two pairs of large view traps are provided below the seats of the pilot and observer, and are operated by cable by the observer.

The Undercarriage

The very strong landing gear has three pairs of struts of aluminium streamline tubes, strengthened by U irons riveted in, and resting below on horizontal steel tubes. The wheel shaft rests in an auxiliary one of steel sheet in U shape welded on. The back root points of the struts are connected by means of a second steel tube auxiliary shaft, welded on, and by a tension band lying behind. A diagonal wiring is further provided horizontally in the auxiliary shaft level. The streamlining of the shafts is cut out in the middle behind the front auxiliary shaft to improve the sight downwards. There is only a diagonal wiring to the fuselage in the level of the middle struts.

The ash tail skid hangs in rubber springs from the fuselage and is strengthened in the rear end by a covering of a rectangular aluminium tube. Its wire stay is supported in the rear stem by a spiral spring. Leaf springs are further fixed to the end of the skid.

Tail plane, rudder and elevator are of welded thin steel tubes.

The aeroplane is equipped with complete dual control. The control in the observer's cockpit can be removed.

The ailerons are interconnected. The twin control cables run behind the rear spar of the lower planes to two direction changing rollers resting on a shaft. Here they part and are led as separate wires of thickness of 2 mm. to the underside of the aileron. In the upper planes the ailerons are connected by control cables, governing two levers in each side. The ailerons are balanced and welded to a common shart.

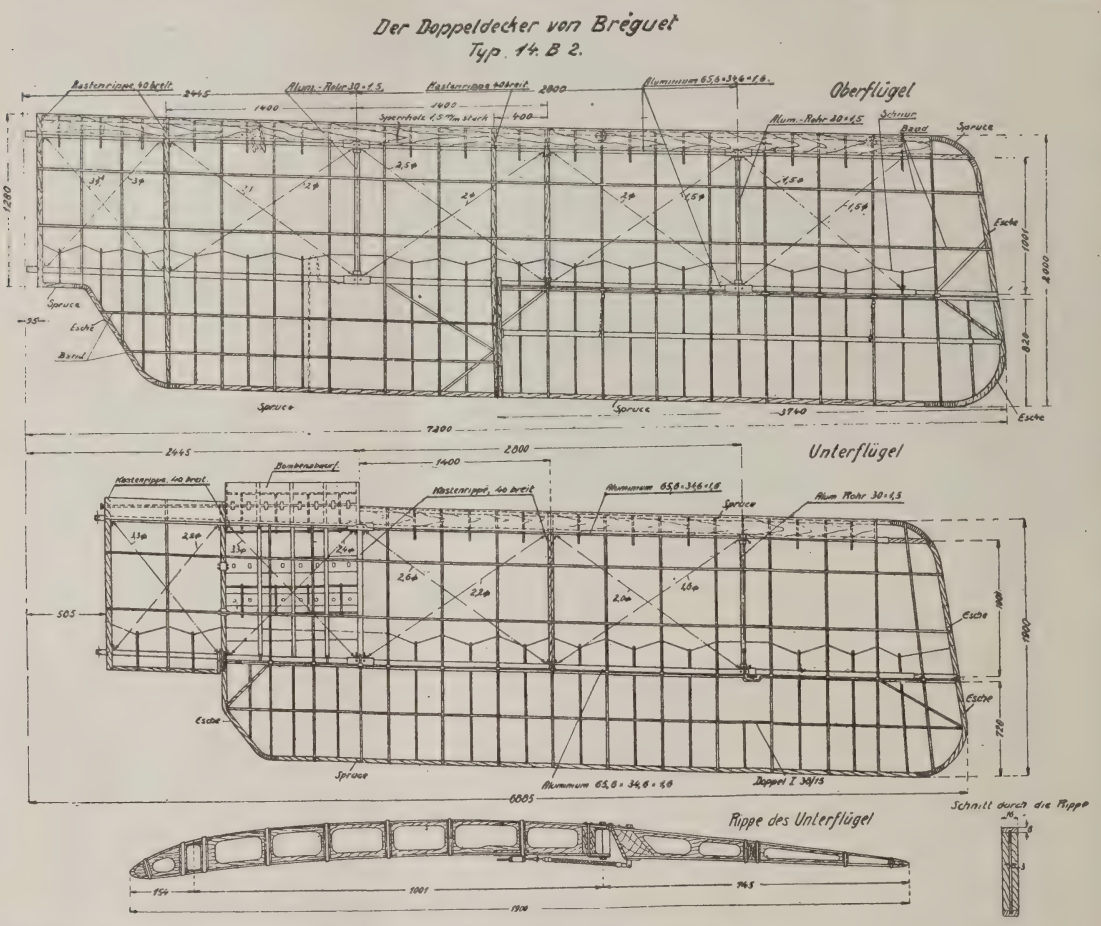
According to a label on the aeroplane the performance of the 12-cylinder Renault engine of V type is 300 h.p. at 1500-1600 normal r.p.m. The engine is the same as the 260 h.p. model, the increase in horse-power being the result of the employment of aluminium pistons and a greater number of revolutions. The engine drives the two-bladed airscrew direct. The exhaust going inwards is led above the upper planes by a collector.

The aluminium radiator forms the front part of the fuselage, and is divided in the middle, each row of cylinders having thus its own cooling system with a separate water-pump.

The Petrol System

Two gravity tanks of 130 litres capacity each are positioned behind the motor. As their underside lies only a little above the carburetors an auxiliary tank of 5.6 litres capacity is provided in front of each carburetor behind the engine, the petrol being led on to the tank from the carburetor. These tanks fill themselves by gravity in horizontal or descending flight from the main tanks. Whereas, if the main tank may be unable to supply any more petrol in climbing, the auxiliary ones then feed the carburetor. Check non-return vales are mounted in the piping to prevent the petrol from running back into the main tanks.

As there is by this arrangement a petrol quantity of 11.2 litres in front of the carburetors without any possibility of being cut off, grave accidents may occur by carburetor fires.



The petrol level in the main tanks is indicated electrically by pressing a contact. A hard rubber tube is mounted in each tank inside a tube and wound with a resistance wire of 0.4 m. thickness, above which a cork float with contacts moves. An oil tank of 18 litres' capacity is mounted on the right side of the engine. The fuel suffices for a height of about 2½ hours' duration under ground conditions.

The Instruments

On the instrument board, protected by a large Triplex safety glass, in aluminium framing, is mounted a tachometer, a watch, altimeter, two cooling water thermometers, the pressure buttons and the indicator arrangement of the petrol height with the dry cell battery lying behind, and the compass. To right of the

A view in the French Breguet factory

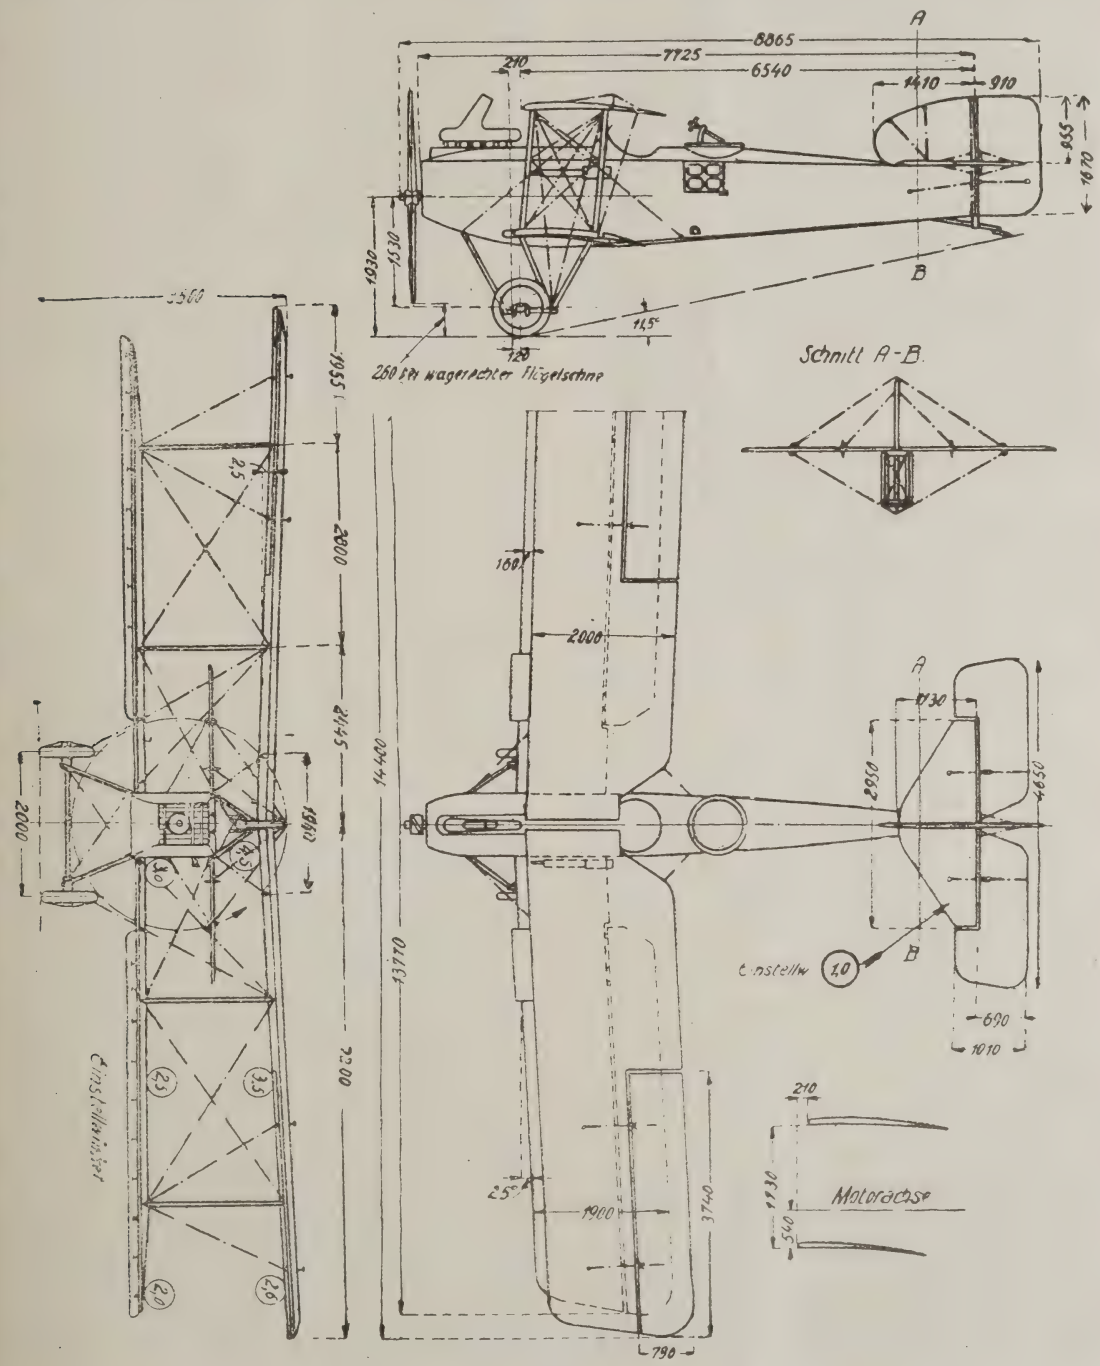
A Breguet Biplane ready for flight test

pilot is to be found the manipulation of the radiator-binding arrangement, the starting magneto, the petrol start spray pump, oil and petrol stop-cocks, as well as the connections for the illumination for night flying and for wireless. To left are the levers for the gas throttle, the spark-timing, the regulation of extra air suply, the magneto switch, as well a a petrol stop-cock.

The observer's cockpit is arranged in the middle of the turning and raising machine-gun ring mounted on the top of the body. The seat is hinged so that the observer may sit either high or low on the bottom of the fuselage. The mounting of Cellon windows in both sides gives him an outside view. The bottom is of steel tube girder work, the sight being thus unhindered downwards when the sight-trap is opened by means of the cables arranged to right of the seat. On the right fuselage wall the bomb dropping mechanism is mounted; to left levers connected with the gas lever and magneto switch in the pilot's cockpit. To both sides are connections for wireless.

The aeroplane is equipped with illumination for night flying and with position lights on the outer struts. Under the root points of the front struts hanging provision for the mounting of searchlights is further to be found. The current for the light and the wireless is produced by a dynamo, which is mounted on

a seat below the fuselage and driven by a propeller.



To left on the outside of the body a fixed machine-gun for the pilot is mounted, being operated from the camshaft of the left row of cylinders.

The observer is armed with two machine-guns clutched together and mounted on a raising and turning ring. As the ring is mounted high, the firing range forward is good.

The bomb store is mounted in the inner section of the power planes with a capacity of 16 small bombs, arranged hanging in two rows of eight. In the dropping operation the two bombs, lying behind each other, are released, at the same time, by a camshaft lying in front of the main spar. The camshafts are connected by chain drive with a shaft in cross position in the fuselage with a grooved pulley mounted, driven by a strong rubber cable.

Another chain drive connects this shaft with a gear wheel mounted to right of the seat of the observer, on the shaft of which a locking quadrant as well as a transmission gear for the stretching of the rubber cord is keyed on. To load the bomb store the chain wheel is first by means of the crank-handle in the observer's cockpit turned till the locking engages again after revolution. When

(*Continued on page* 634)

THE HUGHES AIRCRAFT REPORT

(*Continued from last week*)

SIXTH—THE COURSE OF PRODUCTION; DELAYS; MISLEADING PUBLIC STATEMENTS

It is not deemed to be necessary to review in detail in this report such delays as occurred in the delivery of training planes and engines therefor. As early as February 16, 1918, 1,733 had been delivered of the JN4-D and 683 of the SJ-1 elementary training planes. As already stated, 2,972 of the JN4-D had been delivered by June 30 and the total order for the SJ-1 (1,660) was completed by May 11, 1918. By February 16, 1918, there had been delivered 1,438 of the OX-5 engines and 1,083 of the A-7a engines and deliveries continued from week to week.

The elementary training planes of the JN-4D type seem to have been satisfactory. In connection with this phase of the execution of the aircraft program it should be said that the general average of accidents in training for all the camps in the United States, is one accident for every 3,200 to 3,600 hours of actual flying. The worst school, in this respect, is one accident for every 1,900 hours of flying and the best school shows one accident for every 4,800 hours of flying. While it is somewhat difficult to obtain comparative statistics with respect to accidents in French and British training camps, it is believed from reports from our officers serving in the English and French schools that we have about twice as much flying per accident as either of the other nations.

The condemnation of the SJ-1 plane as dangerous, because of the Hall-Scott engine, has already been mentioned. It is to be noted that as early as February 12, 1918, the Joint Army and Navy Technical Aircraft Board passed a resolution reciting the opinion of the Board "that the Standard aeroplane as completed with the Hall-Scott engine is not a satisfactory training machine" and recommending "that if it is necessary to make further purchases from the Standard Company of types that have been developed by them, that such machines be of the type designed for the installation of the Hispano-Suiza engine and the 150 Hispano-Suiza engines be purchased for these machines". The Standard J training plane with the Hall-Scott engine continued to be used until it was condemned in June, 1918, on General Kenly's return from overseas and after his careful examination of its operation. The order of General Kenly, under date of June 6, 1918, is as follows:

"1. Due to the shortage of training aeroplanes in the past it was necessary to use a certain number of Standard J-1 aeroplanes for training as filler-in until there were sufficient JN-4 machines manufactured for all schools.

"2. At the present time there are sufficient JN-4 machines in storage to entirely replace all Standard machines in use. The Director of Military Aeronautics therefore desires that no more Standard aeroplanes be used in flying training and that steps be taken at once to entirely replace the Standard J-1 machines now in use by JN-4 aeroplanes. The Standard machines can be utilized in Mechanics' Training Schools, Ground Schools and any other schools where it is not necessary that they be taken into the air."

With respect to advanced training planes, it may be said that by February 16, 1918, 60 had been received of the S4-B and 105 of the JN4-H. The delivery of Penguins did not begin until the middle of April, and of S4-Cs until May. There had been delivered by February 16, 1918, 121 of the Gnome (100 H. P.) and 444 of the Hispano (150 H. P.) engines. Deliveries of the Lawrence (28 H. P.) began in March and of the LeRhone (80 H. P.) in May, 1918.

Service Planes

As already stated, the program during the period under consideration and until recently has been practically limited to the DeHaviland 4s and the Bristol Fighters.

The DeHavilands

The contracts for these planes, after the substitution of DeH-4s for DeH-9s, called for 8,500 DeH-4s, viz: Dayton Wright Aeroplane Company, 4,000; Fisher Body Corporation, 4,000; Standard Aircraft Corporation, 500.

Under the first contract with the Dayton Wright Aeroplane Company (dated September 7, 1917), deliveries of the DeH-9s then provided for were to begin in November, and the entire 2,000 were to be delivered by the end of June, 1918. Under the modified contract (January 17, 1918, for 1,000 DeH-4s and 3,000 DeH-9s, deliveries were to begin in January and to be completed by the of July, 1918. Under the final contract (April 1, 1918), substituting 4,000 DeH-4s, the latter were divided into two lots of 2,000 each, the first lot for immediate production to be delivered by August 1, 1918, and the remainder to be delivered as ordered.

The first DeH-4 was shipped from the plant of the Dayton Wright Aeroplane Company on February 5, 1918. It was intended for the American Expeditionary Forces in France, but it was not completely equipped; it did not have any bomb gear that would work. On February 14, 1918, the following telegram was addressed by Mr. Talbott to Colonel Deeds:

"Wire received reference Secretary Redfield and Dr. Stratton. Major Shepler advises first one hundred DeHavilands to remain in this country. If so, will you recall plane shipped for foreign shipment, allowing us to substitute plane completely equipped. Progress here encouraging."

However, the plane already shipped, was not recalled. The transport containing it sailed on March 22nd and, on account of engine trouble in the Azores, it did not reach Europe until May 4th.

Nine additional DeH-4s were shipped by the Dayton Wright Aeroplane Company in February for the use of various fields; two on the 15th, one on the 16th and two on the 17th, intended for Gerstner Field in Louisiana; one on the 21st for McCook Field (which was sent to South Field); one on the 22nd for the Fisher Body Corporation; one on the 23rd for the Standard Aircraft Corporation, and one on the 25th for McCook Field. Four were shipped in March; two for Gerstner Field on the 9th and 12, one for McCook Field on the 10th, and one on the 21st was delivered to the Property Officer at the Dayton Wright Aeroplane Company.

There were no shipments for the American Expeditionary Forces between February 5th and April 3, 1918, when four were shipped; four more were shipped on April 14th and four on April 22nd, and there were no more shipped for use abroad until May 2, 1918. That is to say, up to May 2nd there had been thirteen DeH-4s shipped for our forces abroad. It was in May, 1918, that what may properly be called quantity production of DeH-4s began. By the end of that month 193 DeH-4s, and by the end of June, 529 DeH-4s had been delivered by the Dayton Wright Aeroplane Company. Of these 529, it appears 381 had gone to ports of embarkation, 116 to the Navy and 32 to various destinations in this country, including training fields.

On June 25, advices were received that there were serious defects in the planes which had been received abroad. At the meeting of the Aircraft Board on July 31, Colonel Arnold stated that all planes shipped to Europe by the Army which were found on arrival to have weaknesses were rebuilt at the aircraft production centers. At the same meeting, Mr. Potter stated that the DeHaviland planes for the Navy which had been shipped from the factory but were not yet floated should be sent back to the Dayton Wright Company to be rebuilt.

From June 30th to October 11, 1918 the Dayton Wright Aeroplane Company delivered 1,320 DeH-4s, making 1,849 in all to the latter date.

In the contract with the Fisher Body Corporation (November 6, 1917) provision was originally made for 3,000 DeH-9s, the deliveries to be completed before July 1, 1918. For these there were subsequently substituted 4,000 DeH-4s, of which 2,000 were to be delivered by September 1, 1918—afterwards extended to November 1, 1918—and 2,000 more at dates to be fixed. Up to June 30, 1918 no deliveries of DeH-4s had been made by the Fisher Body Corporation. This company got into quantity production in August and had delivered 452 up to October 11, 1918.

For the order of 500 DeH-9s placed with the Standard Aircraft Corporation (January 26, 1918) there were eventually substituted 500 DeH-4s by the contract of March 28, 1918. No deliveries had been made up to June 30, 1918, and only 49 had been delivered up to October 11, 1918.

The total deliveries of DeH-4s, to October 11, 1918, amounted to 2,350. Of these, 1,617 had been floated, 388 were at ports or in transit, 177 had been shipped to camps and training fields, and 168 are described as being for "manufacturers and miscellaneous."

Bristol Fighters

The contract with the Curtiss Aeroplane and Motor Corporation called for 2,000 Bristols to be delivered by August 31,1918.

There was no definite release for production until February and then only to the extent of 25 machines. 400 were released for production in the latter part of March and 400 more on April 24th. As already stated, only 27 were delivered in all, and the order was cancelled in July.

Liberty Engines

The deliveries were to be completed as follows:

	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.
Lincoln Motor Co.	5	80	160	275	700	1400	1900	1480					
Packard Motor Car Co.	50	200	500	800	1000	1200	1200	1050					
Nordyke & Marmon Co.			25	125	550	700	800	800					
Ford Motor Co.						200	800	1000	1000	1000	1000		
General Motors Co.							25	125	250	300	400	500	400

These were the actual deliveries:*

	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept. to Oct. 11	Total
Lincoln Motor Co.				7	24	134	106	309	484	701	1022	2787
Packard Motor Car Co.	1	25	43	98	153	314	439	556	724	543	970	3864
Nordyke & Marmon Co.								0	16	24	117	157
Ford Motor Co.								53	197	459	1212	1868
General Motors Co.								130	244	398	371	1013
												9689

The total deliveries of Liberty motors (US-12s) to October 11, 1918 amounted to 9,689, of which 6,895 were for the Army and 2,794 for the Navy. Of those for the Army, 3,555 had been floated, 456 were at ports or in transit; and there had been delivered 990 to Allied Governments, 260 to flying fields, 1,429 to manufacturers, etc., the remainder, or 205, being turned over to the Navy.

Contracts have recently been made for the production of the Liberty 8 (US-8), but no deliveries had been made to October 11, 1918.

Misleading Public Statements

In the face of the delays in production a series of misleading public statements were made with official authority. While these statements were authorized by the Secretary of War, he states that they were issued in reliance upon information furnished by the Chief Signal Officer, General Squier, and by Colonel Deeds, who were acquainted with the actual conditions. It is unnecessary to review the delusive predictions and exaggerations contained in these utterances.

But particular attention should be directed to the official statement released for publication in the papers of February 21, 1918, which contained the following:

"The first American built battle planes are today en route to the front in France. This first shipment, though in itself not large marked the final overcoming of many difficulties met in building up this new and intricate industry."

This statement had its origin in a conversation between Colonel Deeds and a representative of the Committee on Public Information a week or two before the completed statement was issued. A draft was first prepared and submitted to Colonel Deeds, who examined it and made some corrections. The statement contained in the paragraph above quoted was not only left unchanged but was the subject of special inquiry. Colonel Deeds was asked what was meant by the "first shipment", and he replied, "They are on the water now, on the way to France." He was then asked, "How many?" and he answered, "I do not know, but I do not think more than ten." The statement in its final form was then presented to the Secretary of War, who permitted it to be issued upon the understanding that it had been verified by General Squier and Colonel Deeds.

At the time this statement was issued (February 20th) only one plane had been delivered for shipment to the American Expeditionary Forces, and while this had been shipped from the factory on February 5th it did not leave the United States until March 22nd. The only other service planes which had been delivered were five DeH-4s, which had been shipped for use at Gerstner Field, Louisiana. No additional shipments of aeroplanes for the use of our forces abroad were made until April 3rd. Actual production in quantity did not really begin until May.

* There are slight discrepancies between the factory records and the Government reports, and the latter apparently based on actual receipts are used in this tabulation.

Colonel Deeds admits that this statement was brought to him before its publication, and that he went through it. He examined it minutely enough to correct with his own hand one of the paragraphs following that above quoted, which gave the number of men required on the ground for every plane in the air, his correction making it 46 instead of 45. Colonel Deeds denies, however, that he said in response to the inquiry upon the point that the battle planes were "on the water now, on the way to France." That he did make this statement is testified to directly and unequivocally by John W. McConaughy and Marlen E. Pew, representing the Committee on Public Information.

When Colonel Deeds was examined as a witness before the Committee on Military Affairs of the Senate, on April 2, 1918, he was asked this question and gave this answer:

"Senator Wadsworth. Did you see, or do you know whether any other responsible officers in your Aviation Section of the Signal Corps saw the statement given out by Secretary Baker on February 21st before it was published?

"Colonel Deeds. No, sir, I did not see it. I do not know of anybody seeing it."

Colonel Deeds admits giving this testimony. He testified that he did not then recall the paper in question.

Colonel Deeds further testifies, in explanation that when the paper was before him, his information was that "four planes were on the cars en route to France", and that it later developed that only one was sent and the others were diverted to Lake Charles, that is, to Gerstner Field, for tests on radiators. The shipments to Gerstner Field, however, had been made directly from the Dayton Wright Aeroplane Company on February 15th, 16th and 17th, and these planes had not been shipped from the factory for the American Expeditionary Forces. There is evidence, also, (*ante*, p. 113) that on February 14th Mr. Talbott had telegraphed to Colonel Deeds that Major Shepler advised that first one hundred DeHavilands should remain in this country and asking on this assumption for the recall of the one plane "shipped for foreign shipment," so that another could be substituted "completely equipped."

There is no question but that this grossly misleading statement was published on the authority of Colonel Deeds and that the Secretary of War relied upon the fact that it had Colonel Deeds' approval in giving it his official sanction. While this conduct of Colonel Deeds does not come within the scope of the Criminal Code, it deserves the prompt attention of the military authorities.

General Squier testifies that he had nothing to do with the statement that was issued for publication on February 21st and that he did not know of it before it was published. He testifies that when it was brought to his attention, he did not regard it as a proper statement to have been sent out, but that he did not institute an inquiry to ascertain who was responsible for it. It is evident that the matter called for immediate investigation and for suitable disciplinary measures, but no steps were taken either for correction or punishment.

The Secretary of War states that the responsibility for the statement clearly rested with General Squier and Colonel Deeds, and that he did not learn of the inaccruacies of the statement until his return from Europe in the latter of April.

There were earlier statements of a delusive character as to the progress of aircraft production, but the particular statement to which attention has been called was inaccurate in its specific statement of facts, and its misleading character was obvious to anyone having knowledge of the actual conditions.

SEVENTH. CAUSES OF DELAY IN PRODUCTION

First: Lack of Knowledge and Experience

This was a fundamental difficulty affecting production in all its stages. The industry was new, and there was a lack of engineers and skilled workmen. Novel problems were encountered at every step, and lack of knowledge bred indecision and confusion. Experience in other manufacturing enterprises gave no assurance of facility in this untried field. In addition, it was necessary to develop new sources of supply of needed materials, and the difficulties of the main contractors had their counterparts in the plants of sub-contractors by which various sorts of material or fabricated parts were supplied.

Second: Defective Organization in the Signal Corps

The duty of providing an adequate organization for Aircraft Production was left to the Signal Corps. It is quite clear that this undertaking was beyond the competency of the Chief Signal Officer, who had neither training nor experience for such a large industrial enterprise, and those who were brought to the task in his department failed to produce an organization which was adapted to meet the exigency.

The contracts were for production, and presupposed that the manufacturers should have an established design. The contractors agreed to produce the described machines in accordance with drawings and specifications to be furnished by the Government. In order to secure production of types of planes unknown to our manufacturers it was necessary that the Government should create an engineering department which should settle the design and furnish adequate and accurate drawings and specifications. But this esential condition of achievement was not met.

Undoubtedly the lack of aeroplane engineers was a serious obstacle. Still, there were a few in the country who had devoted themselves sedulously for a considerable time to the study of aviation problems, and it does not appear that there was a suitable effort to draw to the Government's service such talent as was available. Whether or not much assistance could have been obtained in this way is a question which cannot be answered in the absence of an appropriate test. It was, however, entirely obvious that the exigency called for the most efficient organization and that to add to inexperience the lack of a suitable organization and the confusion of a divided responsibility would inevitably lead to serious delays and threaten the entire program.

There was an Engine Design Section established about July 1, 1917, in charge of Mr. Vincent, who had been engineer of the Packard Motor Car Company, but had no experience in the designing of aeroplanes. And this department did not have anything to do with the designing of aeroplanes as distinguished from aeroplane engines.

Captain (afterwards Lt.-Col.) Virginius E. Clark, who had had perhaps as much aeronautical experience as anyone in the Army, had been in charge of aeroplane designing, but he was absent in Europe with the Aeronautical Commission from June until about the first of September, 1917. On his return he resumed the work of aeroplane designing, and the Aeroplane Experimental Department was organized about October 1, 1917, in charge of Lt.-Col. Clark, who was put in command at McCook Field, Dayton. This organization continued until February 6, 1918. Lt.-Col. Vincent testifies that he had been arguing for an "engineering department" with the idea that it would take entire charge of engineering as it pertained to engines and planes and "definitely straighten out" what he thought to be "an unsettled condition." By this he meant that "an attempt was being made to put planes into production in his country without having complete drawings or a complete understanding as to just what equipment such planes were to carry." But for the purpose of settling designs of aeroplanes and furnishing drawings to the manufacturers the Aeroplane Experimental Department proved to be hopelessly inadequate, and the result was that it was largely left to the manufacturers themselves to work out the designs of service planes, an undertaking for which they were ill-equipped.

When the Aeroplane Experimental Department failed to give satisfaction, instead of strengthening it and making it adequate to the engineering work which had to be done, an additional department was created (about January 1, 1918) which was called the Production Engineering Department. This Department was also located at Dayton, because the Dayton Wright Aeroplane Company was at that place, and there the Department remained until the middle of April. It was said to be its function to supply manufacturers with engineering information, drawings, specifications, etc., from which they could produce in quantity what they were to manufacture; to specify materials, to decide upon details of design, etc. It was not, however, established merely as an aid to the manufacturer in producing according to a settled design, that is to enable the manufacturer to cope with the difficulties which were sure to arise in the course of production, but this Department was largely placed in control of the aeroplane design itself, which the Aeroplane Experimental Department had failed to establish satisfactorily. The new Department was never informed or equipped so that it could perform its function adequately. It was under the general supervision of the head of the Production Department of the Equipment Division, who was experienced in aeroplane engineering or in aeroplane production, and this creation of another inadequate department failed to solve the difficulty.

On February 6, 1918, the Aeroplane Engineering Department was established in charge of Lt.-Col. Vincent, who was put in command at McCook field. Lt.-Col. Vincent at once began to direct the efforts of the new department towards getting some well known machines ready for production, rather than doing the purely experimental or research work, and he obtained permission from Mr. Potter to take the DeHaviland 9 from the Dayton Wright Company at South Field "and put it through McCook Field." But this new department did not have a definite function with respect to the types of service planes already under contract, that is, the DeHaviland 4 and the Bristol, and these were left apparently as before, subject to the inadequate direction of the Production Engineering Department.

The consequences are easy to trace. When the model DeH-4 was received in this country it was accompanied by the English drawings. It was necessary to re-design the plane to accommodate it to the Liberty motor. The model was sent to the Dayton Wright Aeroplane Company, and this Company, which under its contract was to produce in accordance with drawings and specifications furnished by the Government, appears to have undertaken the work of redesigning and making the new drawings. These were made and the DeH-4 as re-designed was flown on October 29, 1917. When, later, changes were required, the company expected drawings to be furnished by the Signal Corps; the Production Engineering Department apparently expected the drawing to be provided by the Company. Rapid and successful production which demanded clearly defined responsibility could not be expected under such conditions. About February 21, 1918, the Production Engineering Department having been unable to secure production, the work on the DeH-4 was virtually taken out of its hands and placed in charge of Lt.-Col. E. J. Hall for the purpose of a swift effort to get results. Lt.-Col. Hall proceeded to get necessary information as to equipment, developed a little organization of his own, at once built three model planes (one for the Dayton Wright Aeroplane Company, one for the Fisher Body Corporation and one for the Standard Aircraft Corporation) and sought to remove as rapidly as possible the various hindrances to production. In this way, production in quantity was finally attained. But this was not the perfecting of the organization, but in substance was a desperate effort outside the regular instrumentalities of the Equipment Division because those instrumentalities could not be relied upon.

With respect to the development of the Bristol, similar conditions existed. When Lt.-Col. Hall had made sufficient progress at the plant of the Dayton Wright Aeroplane Company to warrant it, he turned his attention to the production of the Bristol, at the plant of the Curtiss Aeroplane and Motor Corporation. As he testifies, "they were worse than at a stand-still". "It would have been easier", he says, "for me to have taken and designed the whole machine around the equipment if they had not had the material started". He found that "practically all they did was to get in a row, so that the condition when I went in there was that everybody was damning everybody else." This was about April 11, 1918.

It appears that Captain Clark in the Fall of 1917 began the work of redesigning in order to adapt the Bristol to the Liberty motor, and about the last of October the model Bristol with a large number of drawings was sent to the Curtiss Company. Mr. Mueller, who was the Chief Engineer of the Curtiss Company, states that they were unable to make the plane from the drawings, that "the dimensions would not check up" and that "it was impossible to get the machine together from the parts made from the details of the Signal Corps drawings." In January, 1918, the Production Engineering Department took over the work on the Bristol, but differences with the contractors speedily arose, and at the end of January, for the purpose of reconciling these differences, a conference was held between the representatives of the Signal Corps and of the Company, respectively, and it was determined that engineering decisions should thereafter be left to the engineer of the Curtiss Company. This authority apparently was exercised for two or three weeks, but opposition developed and there was no real progress. Lt.-Col. Hall took the matter up in April and an effort was made to drive through to production. It is apparent, however, that this plane never got beyond an experimental stage, and yet 400 were released for production in March and 400 more in April. This was evidently in response to criticism of delays. But the plane as designed for the Liberty motor was doomed to failure. Had there been an adequate engineering department to settle the matter of design and make the necessary engineering tests and decisions before production was entered upon, much time and money expended in fruitless effort would have been saved.

Throughout this period, the Equipment Division of the Signal Corps presented an organization with a host of sections and departments, with all-defined functions, creating disorder and confusion rather than sustained, well directed and expert effort. There was a vast amount of lost motion. Manufacturers were brought into contact with various divisions with overlapping powers; earnest and able scientific men, who were brought into particular sections, found themselves locking in authority or in conflict with other sections; and uncertainty, indecision and vacillation enfeebled the entire undertaking. Military organization was another obstacle to the rapid prosecution of what was essentially an industrial enterprise. Whatever might be accomplished by such an organization in a thoroughly understood activity, it was certainly unsuited to an entirely new industrial endeavor of this sort. A mobile force in which men could readily be moved about, tested, elevated and deposed without regard to military rank or precedent, was absolutely required.

The inherent difficulties of the situation were thus greatly increased by defective organization. No doubt, also, the swift creation of a large force of inspectors, without the qualification of experience in their line of work, not only opened the door to abuses, but to an extent retarded production.

The situation, as it appeared to Archer A. Landon (Mr. Coffin's assistant) more than six months after we had entered the War, is strikingly shown in his letter to Mr. Coffin, dated October 16, 1917, in the course of which Mr. Landon said:

". . . The lack of organization and continuity of responsibility is so apparent that success will be a miracle. . . . If we are to be successful there must be fixed, from the Secretary of War or the Secretary of the Navy down almost to the office boy, a direct line of responsibility that will make every individual assume the absolute responsibility for the work he is undertaking and under no circumstances should any conflict of authority or responsibility occur. Industrial men of known responsibility and capacity for the particular work undertaken must be selected. They should be peculiarly fitted for the positions they occupy and should be responsible for their work as in civil life. . . .

"We men who have come here in an effort to assist you find ourselves very seriously embarrassed and justly so. We are started off to do what seems to be an important piece of work only to find that this work has been delegated to somebody else in some other department and that we are treading on other people's toes. The result is that we do not get the information we want and we do not get anywhere. They do not throw us out, but they are all adept at pulling the latest Washington game of 'passing the buck', or else, frankly, resenting our appearance in the matter.

"Take the spruce situation as an example of dilly dallying through a lack of organization. The first I knew of the spruce situation was around the latter part of July or the first of August. At that time it was one of your great worries. The entire aircraft program was and is now endangered by the lack of ability to get spruce; and yet from that time until now, notwithstanding repeated conferences, there was nothing done on the spruce situation, either towards closing contracts or increasing production, until October 13th, when Colonel Disque was sent west on the situation; a loss of time of practically three months. If this had been your own business, the men would have been on their way west the day after the matter was first brought up. The only reason that there was no action in July was because we do not possess an organization of direct responsibility and on that account these inefficiencies are possible and they will continue to occur until such time as somebody wakes up and thoroughly organizes the work."

After giving a further illustration, Mr. Landon continued:

"This is not intended as a criticism of General Squier or the other officers, but it is intended to be a very vigorous criticism of methods of organization that make such a condition possible; and I submit to you, sir, that, if this same condition exists in all departments and continues to exist, we might as well submit to the Germans now, because the one way you can beat efficiency is to match it with efficiency, and efficiency can only be obtained by a thorough organizing of our responsibilities and following them through to a definite conclusion, which conclusion should be the winning of the war."

Mr. Landon, leaving the aircraft work in October, 1917, returned to it in June, 1918, then becoming chief of the Production of Aircraft in the Bureau of Aircraft Production. Up to that time, the policy he had recommended had not been carried out. He testifies that he "could see practically no change in the organization in six months"; that is, prior to the new organization through the Bureau of Aircraft Production which had just been instituted.

It should be understood, of course, that the complaint so emphatically voiced was not directed at the Aircraft Board, as this, as Mr. Landon stated in his letter, was "merely an executive advisory board". The responsibility lay with the officers entrusted with the duty of affecting an adequate organization for Aircraft Production.

Third: Lack of Information as to the Equipment Required for Service Planes

The model DeHaviland 4 was not received until about the beginning of August, 1917, and, as already stated, it was necessary to re-design it and make new drawings. But whatever delay was due to a failure to obtain a model earlier, or to the necessity of redesigning the plant, was greatly increased by the lack of needed information as to the equipment which was to be put on it. From the time the model machine, as redesigned, was completed and flown on October 29, 1917, several months elapsed before its equipment was finally determined upon. The engineer of the Dayton Wright Company testifies that "the information which we were anxious to receive and which was necessary for production was not forthcoming until the middle of April."

There appear to have been several reasons for this. There was always the difficulty created by lack of experience in equipping aeroplanes for service in war and there was considerable trouble in obtaining some portions of the equipment. But, in addition, it appears that there was a lack of exact and detailed information as to just what was required. The drawings and the specifications which accompanied the sample plane sent here were supposed to designate definitely the apparatus to be put upon the planes and its location. The testimony is that these drawings and specifications "did not check up with the actual plane," and there was resulting uncertainty as to what should be done. Communications with the other side were had frequently with regard to instruments, accessories and various parts of equipment, but, despite this, the uncertainty seems to have continued for a long period and there was apparently an inability to frame a definite bill of material which could be given to the manufacturer. The showing indicates either an extraordinary lack of decision on the part of those whose duty it was to decide, or an even more remarkable absence of administrative efficiency in seeking and obtaining necessary information.

About February 10, 1918, definite instructions were received from the other side as to the armament and instruuments of the DeH-4, but these instructions involved serious changes in the plane. And, subsequently, there were further changes in equipment, as stated below, causing still further delay.

Fourth: Changes in Design and Equipment of Service Planes

The folowing statement, set forth in the testimony of Mr. Schoonmaker, the engineer of the Dayton Wright Aeroplane Company, which is substantially uncontroverted by the representatives of the Signal Corps, is an illuminating description of the delays in production incident to changes in design made necessary by changes in equipment so far as the DeHaviland 4 is concerned and also indicates the waste thereby occasioned. It will be observed that changes were made necessary not only by new requirements as to equipment, but by inaccuracies in drawings and various defects. Mr. Schoonmaker testifies:

'The first sample DeHaviland machine was received on August 14, 1917. This was accompanied by an incomplete set of drawings, but with the machine as a sample and with what drawings we had at hand, we were able to complete the necessary lay-out from which to build one sample machine which was flown on October 29, 1917. This plane was satisfactory in every detail as a machine and practicaly no changes have been made in the construction except where they were affected by the equipment which the machine was to carry.

'We were advised at that time in answer to our request for information on guns, that the machine was to be equipped with the Vickers Gun and that the gun mounts would necessarily be the same as the English gun mounts. This information was requested by the Dayton Wright Company during August when the preliminary lay-outs of the machine were being made. At a late date we were advised that the Marlin Gun would supplant the Vickers, and that the Signal Corps would take care of the necessary design of gun mounts, etc. The front gun mount design was received on January 8; after a conference with Signal Corps men, it was decided that this mount would not be satisfactory and, therefore, was discarded. The Dayton Wright Company produced a design of gun mount and cartridge box which was built and installed and accepted by the Signal Corps after a firing test on January 26.

"Owing to the fact that the Marlin Gun was not similar to the Vicker, a complete re-arangement of the cowling over what had already been designed was necessary. The first drawing of the Marlin Gun which we received was delivered to us on February 12, but no bill of material on the complete gun equipment accompanied same. On February 26 we were requested to mount two staionary guns on the forward cowling. This necessitated a re-design of the gun mounts already ordered into production, and this work was carried on by the Signal Corps. This also affected all cartridge boxes of which drawings had been made and which were released to production. A re-design of the cartridge boxes for the double gun mount was furnished by the Signal Corps on March 5. This design was not satisfactory, as the drawings were incorrect and the pieces manufactured from them did not assemble in the machine. A new re-design was furnished by the Signal Corps on March 15; parts were made from these drawings and were released to production. On April 1 the Dayton Wright Company was ordered by the Signal Corps to again re-design the cartridge boxes changing certain dimensions; since that date few minor changes have been necessary, but nothing which directly interfered with the production of these parts.

"Changing the gun equipment as mentioned above, necessarily changed the shell chute lay-out. The first drawing which we received from the Signal Corps for the left hand gun chute came to us on March 5. Parts made from these drawings were not satisfactory as they did not assemble in the machine. The Signal Corps corrected these drawings and sample parts were made and the Dayton Wright Company's drawings were released for production several days later. The Signal Corps found, however, that these samples were not satisfactory and they were rejected as there had been an error in the drawings. The Dayton Wright Company re-designed the chute for the left hand gun on March 29. Samples were made from these drawings which were satisfactory to the Signal Corps and released to production on April 7.

"The first right hand shell chute was laid out by the Signal Corps on March 6. Samples manufactured from these drawings were not satisfactory and did not assemble properly in the machine. The Signal Corps proceeded on the correction of these drawings and they were released for the production of sample. These drawings were very difficult to work to and samples manufactured from them were not satisfactory and rejected.

"The Dayton Wright Company produced a new design of this shell chute on March 29, which before the samples could be made and tried out, it was seen that a new design would be necessary due to the change of location of the electric generator for the electrically heated clothing. A new design was started by the Dayton Wright Company on March 30.

"A design along entirely different lines had been started in the meantime by some Signal Corps men at South Field on March 29, and this type was approved on March 31 by the Signal Corps and drawings were made and released to production. This design was tested out on the evening of April 2 and proved unsatisfactory. Another new design was started by the Signal Corps on April 3, which after a few modifications was released to production on April 11.

"The same procedure of re-design and development as was required for the shell chutes applies also to the cartridge box and shell chute covers.

"Our first request for information on the synchronizing device was in November, 1917, but up to February 14 no bill of material or complete set of drawings had been delivered. We received on January 23 a few parts which were intended for production, however, the assembly was incomplete and the parts made would not fit the engine. We received drawings of the hand pump on February 5. During January a sample hand pump was delivered to South Field; no drawing or instructions accompanied this to show mounting and this office was never advised as to its use. When assembled on the machine in January, it was found that an interference was encountered with the gasoline shut-off cocks and strainer, necessitating a re-design of these parts and the transferring of them to the other side of the fuselage. This in turn caused an interference of the spark and throttle controls necessitating scrappage of parts then on hand and re-design of this lay-out.

"The first synchronizing outfit which we received caused a considerable amount of trouble and upon examination of the trigger motors, it was found that practically no two of them were alike and it was almost impossible to get a pair of guns on a machine which would function correctly. The first synchronizers were delivered directly to us instead of the engine builder, and they were not made so as to be directly interchangeable with the motor crank shaft, the result being that a considerable amount of hand work had to be done in the fitting up of these synchronizers.

"On April 2 it was found that the synchronizer generator did not have a satisfactory lubrication system and it was necessary to connect it to the motor oiling system. This necessitated the dissembling of the synchronizer head and welding on a special boss for the attachment of this oil line. This has been done on all of the synchronizers to date.

"Information, drawings and bill of material for the gun sights were requested on October 19, 1917. A list of different types of sights were received on January 4 but no bill of material or drawings. Drawings for wind vane sights were received February 6. No drawings were ever furnished on any of the sight mounts, however, the sight locations were approved February 13.

"This will recall that it was advised that the old English DeHaviland be used for the mounting of guns and sights so that all of the difficulties which were likely to be encountered, could be worked out on this job. Our engine cowling was held within the limit of the cowling used on the English job so that no interference would occur. On November 20, it was called to the attention of the Signal Corps that no use had been made of this machine to date, and early in the Spring was shipped to Wilbur Wright Field.

SOME RECENT AERONAUTIC BOOKS

Internal Combustion Engine Manual

THE fourth edition of this volume, which marks its eighth year as a text-book at the Naval Academy, has been completely rewritten, enlarged and brought up to date. The subject of fuels is first treated. These fuels follow in natural sequence. The engine proper naturally divides itself into four systems: fuel system, ignition system, cooling system and lubricating system. Each is treated in detail. A comprehensive chapter on aeroplane engines is included, covering the five types: vertical, horizontal opposed, V type, radial and rotary. The book is clearly written and well illustrated with half-tones and line cuts.

Lubrication of Internal Combustion Engines

C. W. Stratford, the consulting engineer of the Tide Water Oil Company, has rendered a service to engineers confronted with the problem of efficient lubrication by the publication of the handbook on "Lubrication of Internal Combustion Engines." Part I deals with "Internal Combustion Engines: Design, Operation and Lubrication"; Part II, "Oils: Characteristics and Methods of Testing Qualities"; Part III, "Transmissions, Differentials and Their Lubrication Charts." Some of the diagramatic illustrations are particularly well worked out, and ought to be of great service to the student of lubrication. The book has been prepared for complimentary distribution amongst engineers and copies may be had from the Tide Water Oil Company, Veedol Department, 11 Broadway, New York.

High Speed Internal Combustion Engines

This volume by Arthur W. Judge, A.R.C. Sc., Diplomat of the Imperial College of Science and Technology, is one of the most complete single volume discussions of the subject and was used during the late war by practically every school where internal combustion engineering was studied. It comprises seven chapters as follows: The Thermodynamics of the Internal Combustion Engine; Explosion and Combustion in the Engine; The Conditions Occurring in Actual Engines; Pressures and Temperatures in Internal Combustion Engines; Indicators and Indicator Diagrams; The Mechanics of the High Speed Internal Combustion Engine; Engine Balance. The book should be on the desk of every automotive engineer. Price, $7.50 postpaid.

Automotive Magneto Ignition

Automotive Magneto Ignition, its principle and application with special reference to aviation engines, by Mich. E. Toepel, and instructor in the U. S. Government School for the study of magneto ignition, is the latest addition to printed discussion on this subejct. It is a small volume of some ninety-six pages, but it goes into the subject very thoroughly, and is so written that it is quite understandable to the non-technical subject. Copious illustrations and diagrams add to the clarity of the text matter.

Aeroplanes and Aero Engines

In the preface to this volume it is characterized as "As an introduction to the study of flight in simple language for the man in the street," and this is accurate. It will be useful for the layman who wants to grasp quickly the elementals and then pass on to a sincere study of the science of aeronautics.

Submarine Vessels

Because of the past aircraft has played in the battle against undersea craft, "Submarines, Torpedoes and Mines," by W. E. Dommett, is of interest at this time. It is a well put together book and the text matter and illustrations are well chosen. Price, $1.10 postpaid.

Aero Engines, Magnetos and Carburetors

As a lieutenant in the Royal Air Force, Harold Pollard secured the engine experience which he places permanently on record in this little book. In his preface he says:

"To the aviator of the future this book is dedicated by the author with the hope that it may aid in smoothing the difficulties from the path of some of those who are striving to qualify as pilots. Every endeavor has been made to write in simple, everyday language on a subject necessarily somewhat technical, so as to bring it within the capacity of the amateur.

"During many years of experience with the engines of the types dealt with the writer has gathered a quantity of information valuable to the leaner, and publication of this has been urged upon him by those in touch with his work. It was considered that a volume of this nature would not only be helpful, but almost a necessity to the beginner."

It is quite a satisfying volume and should be decidedly useful to the aviator who is not desirous of going too deeply in the study of ignition and carburetion. Price, $1.10 postpaid.

(Copies of the above volumes can be secured at the Aeronautic Library, Inc., 299 Madison Avenue, New York)

IMPROVED ARC WELDING TOOL

IN arc welding, a considerable portion of the operator's time is consumed in changing welding electrodes. Therefore, the lack of a suitable welding tool has been a distinct disadvantage.

Up to the present time a large variety of welding tools have been developed and placed on the market. The oldest forms consisted of a spring tongs which had to be spread apart by an instrument similar to an offset screwdriver, when it was desired to insert the electrode and release it. Another type employed a pair of tongs, that could be operated by a thumb lever. The disadvantage of this scheme was that in case the electrode stuck to the work, the operator released the tool, drawing an arc between the tongs and the electrode, which practice soon destroyed the tongs.

The type in most common use to-day employs a strong compression spring. If this spring is strong enough to hold the electrode when it freezes to the work, so that the electrode cannot be pulled away from the tool, it requires considerable strength to operate it, and therefore it is not always well suited where girl operators are employed.

The present development first of all was designed to make the operation of changing electrodes absolutely definite, so that in production work it could be counted upon. The next was to make an instrument that would hold the electrode and permit any amount of pull, in case

THE METAL AIRSCREW

By VLADIMIR OLHOVSKY

WHETHER the future belongs to the wooden airscrew now in use, or whether it will give way to the metal airscrew, is a question that has risen in many minds.

The writer has had the opportunity of devoting himself to the above question for the last six years, and he has also had the opportunity of making the most varied experiments under the most favorable conditions both upon wooden airscrews and metal propellors.

I have tested the best types of airscrews in use today in Europe. Moreover, I have built 122 propellers of my own design, using different kinds of wood, and seven metal airscrews, made by hand. Of the latter, five were iron and hollow inside; from among these five, three operated successfully on the Russian front for over two years (1915-1917).

All the airscrews were tested both on the ground, by means of specially constructed mountings or an immovable aeroplane, as well as in flight.

The results of the experiments were as follows:

The Wooden Airscrews, lacking in any special advantages and *not being in harmony with the aeroplane motor,* conissting wholly of metallic parts, has the following defects:

1. Atmosphere changes influence it strongly. From the constant changes of temperature, which are sometimes considerable, and from the *dampness* of the surrounding air (summer heat, winter cold, dry air, damp air, rain, and so on), the screw becomes warped and the symmetry of its shape is lost. Each of the blades develops a different pitch. When it is placed on an aeroplane, such a propeller works with big *vibrations* that reduce its efficiency and thus have a detrimental action upon the solidity of the foundation of the propeller motor group adjustment.

2. Wood as material for airscrews has *not sufficient firmness* to withstand the blows of sand, small stones, mud, high grass and other such impediments during the run preceding the rise in the air; nor the impact of the drops of splashing water during the run of the seaplane. Aviation practice has shown that, owing to the above reasons, after a few months of regular work, the front trenchant sides of the blades show such deep scratches and indentations that the propeller must be replaced, because it cannot be repaired.

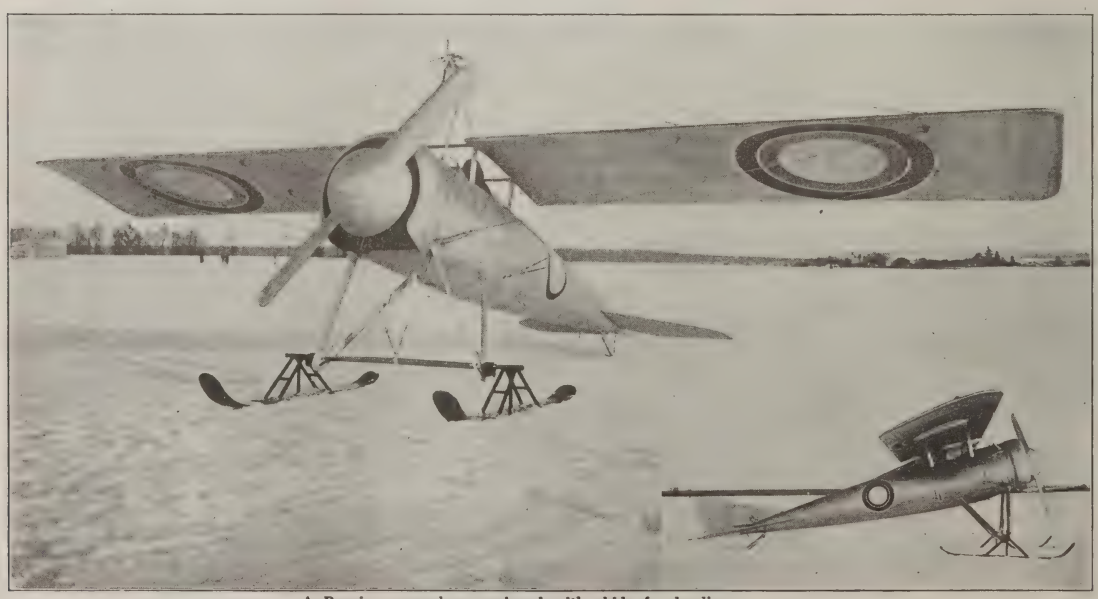
3. When larger stones, splinters, etcetera, enter a wooden propeller, or if it is pierced by bullets or pieces of shrapnel, splinters of wood of different sizes are broken away, due to the fragility of the material. This in turn sometimes causes such a strong vibration of the airscrew that, if it is not immediately stopped, either the propeller is shattered or the motor is torn from its base. Owing to the shifting of the centre of gravity to the rear, the aeroplane loses its balance and falls on its tail and usually shatters. Such accidents have been frequently witnessed on the battlefields during duels between aeroplanes.

4. Independently of the material with which the wooden propeller is covered, be it lacquer, varnish, wax, paint, cloth, copper binding, etc., after a certain period of work in the open air, without being taken off the machine, the action of the dampness and of the high temperature causes *the glue* with which the boards of the propeller are glued to lose its adhesive properties and the propeller falls apart along its joints. It cannot be glued again. Even in case of a barely perceptible unglueing of the joints of the propeller, the latter must be discarded, for if it is placed on a motor, the action of the axial thrust and of the centrifugal force during the rotation accompanied by unavoidable vibrations, it will come apart along the seams.

The *difficulty of preserving* wooden propellers and of handling them renders them short-lived.

Capt. V. Olhovsky of the Russian Army, a student of aeronautic engineering and mechanical flight since 1908

5. Wood as material for the building of wooden propellers has many disadvantages. It *differs widely in its qualities,* depending generally upon the *species of tree;* the quality of each species depends, moreover, upon the *condition of the soil,* and so forth. It is impossible to receive two perfectly similar planks, for the *fibres* will be laid always differently, and the density, elasticity, and strength of the wood will always differ. Differing in its structure and acting *differently in different directions,* be it the length of the fibres or across them, wood, contrary to metal, possesses purely accidental qualities that *cannot be accurately summarized.*



6. The high degree of *flexibility* of wood can hardly be considered a positive quality for propeller material, for in conjunction with the variety of structure of wood which results in the *deformation* of the operating propeller, it usually differs in the different blades and results in *harmful vibrations* of the revolving propeller.

7. The process itself of the *building* of the wooden propeller is quite *complicated* and gives unexpected results.

The first necessity is to have selected wood, without knots, irregular grain, or other defects, taken from a few of the rare species. It must be carefully weathered until it contains only a definite percentage of humidity. Then every plank is mathematically correctly planed and smoothed and cut according to the corresponding model. Several such planks, differing in number from 6 to 10, are first heated and then glued together to form one block, which takes a considerable time to dry. Rough planing of these blocks follows either by hand or by machine, and finally the propeller is *planed by hand* according to special moulds, sometimes fairly numerous, thus offering highly minute work. Before the final surface polish of the propeller, it is balanced, and the heavier of the blades is cut down *on sight.* As is known, the wooden propeller is always *carved* as a finishing touch and the quality of the propeller depends upon the quality of this work. But, not being built of a homogenous material, wooden propellers always differ among themselves. And *no two propellers can ever be perfectly alike and working with identical efficiency* from the point of view of aero dynamics.

Practice shows that the best propellers are made by master workers, who have a strongly developed sense of measures as well as an artistical and scientifical sense. Unfortunately, such artists are very rare.

In 1915-1916, I experimented with *aluminum propellers, made entirely* like water screws. It was established that the solid cast ariscrews were too heavy, although they operated *without vibrations, developed*

A Russian monoplane equipped with skids for landing on snow

an exceilent thrust, and rendered the motion of the motor extremely smooth, acting as a flywheel. At the same time a most interesting observation was made, indicating that *the consumption of gasoline was reduced* by 15 or 20 per cent. every time that there was placed on a motor (Salmson 150 h.p.) an aluminum propeller in place of a wooden one. This was due to the more regular motion of the motor.

The experiments led to the conclusion that it was necessary to pass to the building of *lighter metallic propellers—hollow inside.* The subsequent experiments empahsized this by indicating the great possibilities in the indicated direction. It was established that the building of a perfect metal propeller, hollow inside, was dependent upon the following three factors:

1. The *shape* of the propeller, with the gradual increase of the transverse section of the blade of the propeller from the periphery to the centre.
2. The *material* for the propeller, which must give the least weight with the greatest degree of solidity of construction.
3. The *method of building.* Exactitude, simplicity, strength, and so on.

It is easy to prove that it is possible to build an airscrew from *sheet steel, duraluminum, or acieral,* and even from *sheet aluminum,* which will be strong and yet weigh less than a wooden one.

Practice has established the empirical formula for the normal *weight W (in pounds) of the wooden propeller,* depending upon the *horse power H of the motor.*

For a *two blade propeller*

$$W_2 = 3.\sqrt{H}$$

For a *four blade propeller*

$$W_4 = 5.\sqrt{H}$$

Thus, for example:

For a *100 h.p. motor*

$W_2 = 30$ lbs.; $W_4 = 50$ lbs.

For a *400 h.p.* motor:

$W_2 = 60$ lbs.; $W_4 = 100$ lbs.

The calculation of the solidity of a metal propeller must be made according to the formula of the action of the *centrifugal force* upon the propeller.

Practice has defined *the most useful average, giving the maximum efficiency rapidity of rotation of the airscrew from 900 to 1200 revolutions per minute.* Let us take as an example the least advantageous speed for us, that of *1200* revolutions per minute. Let us suppose that the *diameter* of a two blade propeller reaches *10* feet, the average *width* of the blade being *1 foot* (which is sufficient for a *400 h.p.* motor).

The surface of the propeller, on both sides, $=$ *20 sq. feet.*

WEIGHTS OF SHEET METAL

(lbs. per sq. ft.)

Thickness (inches)	*Steel*	*Aluminum*	*Duralumin* or *Acieral*
.182	7.3	*2.53*	2.68
.128	5.2	1.78	1.88
.102	4.1	1.42	*1.51*
.081	3.3	1.12	1.18
.064	*2.6*	0.89	0.95
.051	2.1	0.71	0.76

Let us suppose that we have sheet *steel* whose thickness is .064", or *aluminum* .182", or *duraluminum and acieral* .102".

We will thus obtain the corresponding *weight of the propeller:*

In the case of *steel:*

$2.6 \times 20 = 52$ lbs.

In the case of *aluminum:*

$2.53 \times 20 = 50.6$ lbs.

In the case of *duraluminum or acieral:*

$1.51 \times 20 = 30.2$ lbs.

We thus get weights that are below the corresponding weights of wooden propellers (60-100 lbs.).

We will now prove that the *strength* of the propellers built of the above mentioned materials is quite sufficient. Late us take *the formula of centrifugal force F* acting upon a rotating airscrew:

$$F = m.\frac{v^2}{r} = \frac{w}{g}.\frac{v^2}{r} = \frac{w}{g}.\frac{(2\pi rN)^2}{r} = \frac{4\pi^2}{g}.w.r.N = 1.2 \times w \times r \times N.$$

Let me examine the average and most dangerous section of a blade by applying the formula of centrifugal force:

For a *steel and aluminum* propeller:

$w = 52:4 = 13$ lbs; $r = 10:4 = 2.5$ feet; $N = 1200:60 = 20$ rev. per sec.

Thus:

$F = 1.2 \times 13 \times 2.5 \times 20^2 = 15{,}600$ lbs.

For *duraluminum and acieral:*

$W = 30.2:4 = 7.5$ lbs.

Consequently:

$F = 1.2 \times 7.6 \times 2.5 \times 20^2 = 9{,}120$ lbs.

In the case of a *steel* propeller, the *section of the material* of the blade will be as follows:

$.064 \times 12 \times 2 = 1.54$ sq. inches.

If we take *Type "A" Chrome-Vanadium Steel,* annealed, with *Elastic Limit 61,000 lbs.* (*Elongation 34%* at the point of tensile breaking stress), it will be found that the section of the propeller blade will stand the strain, working with elasticity:

$1.54 \times 61{,}000 = 93{,}940$ lbs.

We will consequently have a safety factor of elastic resistance:

$93{,}940 : 15{,}600 = 6.$

If we take Type "A" *Chrome-Vanadium Steel* (oil tempered 900°—625°C.) with Elastic Limit *99,000 lbs.* (Elongation *30%*), we will find that the section of the blade will stand:

$1.54 \times 99{,}000 = 152{,}460$ lbs.

Consequently we have a *reserve of elastic resistance:*

$152{,}460 : 15{,}600 = 9.8$

In the case of an *aluminium* propeller the *working section* of the material of the blade:

$.182 \times 12 \times 2 = 4.37$ sq. inches.

This section will stand the breaking stress elastically:

$4.37 \times 10{,}000 = 43{,}700$ lbs.

Consequently we have a reserve of strength which equals *3.*

In the case of *duralumin or acieral* we have the *working section* of the material of the propeller blade:

$.102 \times 12 \times 2 = 2.45$ sq. inches.

The section of the blade will stand, working elastically, the following:

$2.45 \times 28{,}000 = 68{,}600$ lbs.

Consequently we have a *reserve of elastic resistance, when the propeller weighs twice as little as a wooden one:*

$68{,}600 : 9{,}120 = 7.5.$

Thus *the metallic propeller can be built with a sufficiently solid reserve of strength, although it will be lighter than the wooden one.*

Almost *all the defects of wooden propellers now in use have no place in the metal propeller.*

Thus:

1. Atmospheric conditions have no effect upon the metal propeller, such as changes of *temperature, dampness* of the air, etc.
2. The metal propeller *resists excellently the blows* from sand, grass, pieces of mud, and so on at the time of the run preliminary to the rise from the ground, as well as the drops of water that rise at the time of the run taken by a seaplane along the surface of the water.
3. The metal propeller *resists* equally well the impact of *small stones and splinters* and does not fear either *water drops* or *bullets* through the blades. The propeller that has been shot only whistles slightly.
4. Not having an adhesive foundation, such as glue, which fears dampness and so on, the metal propeller *can be preserved under any conditions.* This makes it much more durable than the wooden ones.
5. Contrary to wood, metal is a highly *homogenous material* in structure and can easily submit to the most *exact calculations.*
6. The hollow metal propeller, owing to the homogenity and sufficiently strong structure of the blades, works almost without any deformation, *without vibrations,* with the *maximum efficiency.*
7. The process of building a metal propeller gives an opportunity of obtaining *any given number of propellers* of a given type, *similar as to material, construction, quality of workmanship, strength, aerodynamic qualities, and so on.*
8. This process in *mass production* reduces itself to the building of the following: press *forms, stamping* for cutting sheet metal according to definite plans and of the *press* itself. The parts of the propeller are either silvered *soldered* or *welded* with oxygen-acetylene process, electrically welded or *riveted* among themselves.

The above leads to the conclusion that *we are now on the eve of conquering the air with the help of a new child of aviation—the metal propeller.*

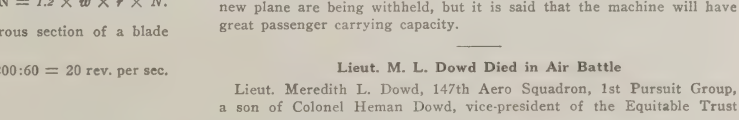
709 Bomb Raids in Germany

London.—Statistics published relative to the work of the independent air forces show that during the thirteen months preceding the armistice 709 bombing raids were made by British aviators over German territory.

There were 374 raids on large German towns, 209 on German airdromes established for the defence of the Rhine and 126 on other military objectives. The list of large towns visited shows that 52 were bombed during the period.

Americans Cited By French

Paris.—Americans were among those cited in the latest issue of the official journal.



They were Lieuts. Alan Winslow and Douglas Campbell, aviators; Lieut. George Davis, Second Lieut. William Koob, Corporal Frank J. Hurrey and Private Leo Lipsie, 101st American Infantry; Privates Frank Coyle, Cyril Johns and Fred Becker, of the 102d Infantry.

Building New Plane for Overseas Flight

A new type of aeroplane for trans-Atlantic flight is being built at the plant of the Standard Aircraft Corporation at Elizabeth, N. J., it became known recently. The plane is being constructed under the direction of Charles H. Day, chief engineer of the company. Mr. Day is the inventor of the tractor type of plane in general use to-day. Details of the new plane are being withheld, but it is said that the machine will have great passenger carrying capacity.

Lieut. M. L. Dowd Died in Air Battle

Lieut. Meredith L. Dowd, 147th Aero Squadron, 1st Pursuit Group, a son of Colonel Heman Dowd, vice-president of the Equitable Trust

Company, was killed in air combat north of Verdun on October 26th. Details of his death were received by his father recently in a letter from Lieutenant Dowd's brother, Lieut. H. L. Dowd, of the Medical Corps, on duty at a place near where his brother met his death. Lieutenant Dowd started on patrol over the lines on October 26th with three other American aviators. He was delayed by engine trouble and his companions got away a few minutes ahead of him. While alone he ran into a squadron of four German machines of the famous Checkerboard Squadron. He immediately gave battle and made a good fight against great odds as other German machines appeared. He was shot down, his machine landing in a tree, and he died in a hospital later from machine-gun wounds. He was buried by the French troops near Dannevoux. Lieutenant Dowd was 23 years of age and was a member of the Class of 1918 at Princeton University.

A series of Curtiss motors being tested at one of the American aviation fields

FOREIGN NEWS

Finnish Air Traffic Company

Stockholm, Sept. 29.—According to advices from Helsingfors, an air traffic company has been formed there with a share capital of two million Finnish marks.

Italian Trade Notes

The efforts of several prominent citizens of that place to enlist Naples in the aeroplane business was officially crowned with success at the end of last month when the High Commissioner for Aviation visited the city and all its various aerial businesses.

He has subsequently promised to nurse the trade there to his utmost, reclaim the stolen hands, and furnish the raw stuff for manufacturing.

Naples, as well as having three big concerns well known to those who are interested in things aviatory, has a motor works and several small firms. A flying and testing "place" is situated near the city, and a lot is being done and expected.

As well as a number of official ceremonies, the Hon. Chiesa has been visiting and presiding over several important gatherings during the last few weeks. At —— he was in the air on a new machine reputed to be of great use. Even for a modern Minister he has an inestimable gift of energy. So perhaps we shall not wait long for the new Ansaldo wonder attributed to Ing. Brezzi, of that firm.

In Sofia

The following account from Mr. G. Ward Price of his visit to Sofia on October 11th appeared in various newspapers on October 21st:

I arrived here this morning by the first British aeroplane to land here since the capitulation, the start having been delayed by bad weather. A throng of brown-clad Bulgar mechanics with a dozen of their flying officers watched the landing of the three British aeroplanes with curiosity, while two or three Germans, who must be the last of those who used to strut about this ground, the lords of all they surveyed, walked disdainfully away.

In a Bulgarian Army motor-car bearing the Royal arms blazoned a foot square I drove into the capital with a colonel of the R.A.F.

The London Enemy Aircraft Exhibition

It is announced that early next month the Exhibition of Enemy Aircraft at the Agricultural Hall, Islington, will be thrown open to the public.

The machines shown have been re-erected, so as to show not only their external features, but the details of their construction.

Amongst other machines on view may be mentioned the Gotha, Friedrichshafen, and A.E.G. bombing machines, the Halberstadt, L.V.G., D.F.W., Rumpler and Hannoveraner two-seater, the A.E.G. armored trench fighter two-seater and the Fokker (biplane and triplane), Pfalz and Albatros scouts.

There are also a number of engines and accessories, including wireless gear, machine-guns, bomb-sights, electrically-heated clothing, and innumerable aviation instruments.

2,000 Turks Captured by Aeroplanes

Aeroplanes south of Amman secured the surrender of 2,000 Turks, says Mr. W. T. Massey writing from Damascus. A pilot, catching sight of a long, drawn-out column, dropped a message, saying that if they did not surrender they would be bombed. He returned to his aerodrome with no answer. Six machines then went up with bombs. While they were circling over the troops a ground signal was laid out recalling them. The Turks raised the white flag, and came in to be taken prisoners.

Feeding Refugees by Aeroplane

It now appears that when during the Turkish advance in Northwest Persia some thousands of refugees were isolated in the Urumia region, the British succeeded in establishing communication with them by aeroplane and endeavored, though unsuccessfully, to send a relief convoy.

Damage by Enemy Air Raids in England

The British Committee on War Damage, which is not an official body, is about to present to the Government returns of casualties which have resulted from the enemy raids by aircraft and bombardment. The returns are from areas having a population of more than one and one-quarter million. Town clerks and clerks of urban and rural areas which have been attacked, and from which returns have not been received, are asked to send the returns to the honorary secretary of the committee, and it is expected shortly that there will be an official announcement of the damage done by German air raids on England.

Lord Northcliffe's Opinion

Lord Northcliffe, at a luncheon given to the American Editors at Printing House Square on October 10th, said:—

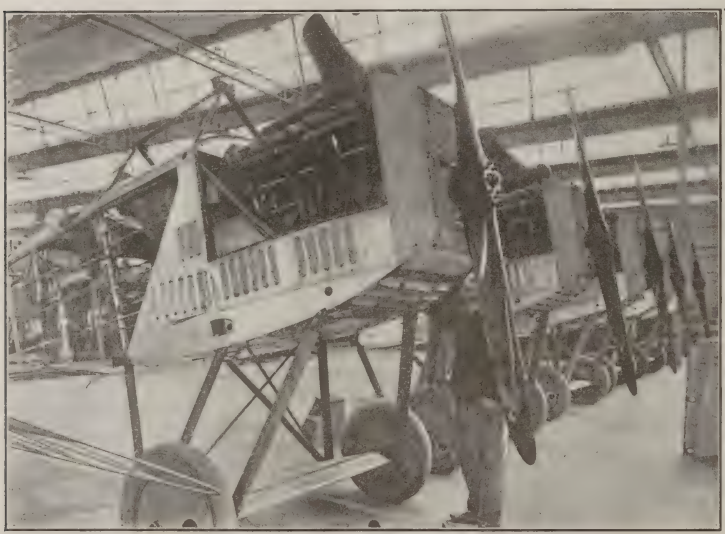
"We have to look—we who are engaged in the business of spreading public intelligence—at the effect on our own industry of some of these developments. Take flight, for example. Will flight concentrate newspaper production into one or two hands in great centers whence the newspapers may be disseminated by flying machines? Personally, I do not think it will. I know that there are provincial communities apprehensive of the destruction of their own local public opinion—one of the most valuable inspirations toward national judgment."

Mr. Handley Page's Views

Mr. Handley Page, in an article contributed to "Overseas", speaks of the future in store for aerial transport.

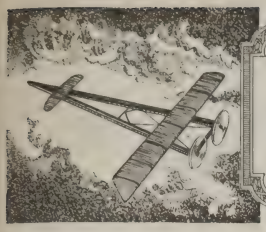
"The great improvements recently made in the big machines," he states, "have rendered commercial transport a practical possibility. It will be possible to carry mails and passengers at a rate which compares very favorably with railway and steamship charges. As to danger, it will be infinitesimal when war conditions are removed, and certainly no greater than when traveling either by railway, motor, or steamship." Mr. Page points out that it would be possible to deliver a letter to America by aeroplane as quickly as a deferred telegram, and that documents could also be sent for signature. The aeroplane will shorten the journey to America to one day.

[One wishes that aeronautical enthusiasts would not underrate the dangers of flying. Who would hunt, if hunting were a safe amusement?—Ed.]



A. S. C. Aeroplanes

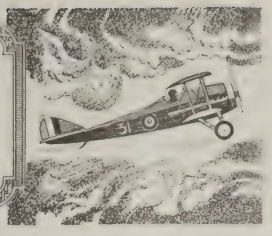
An incident reported in connection with the offensive in Flanders is worth chronicling as one of those examples that it may be desirable to quote later on. Certain Belgian divisions reached a point the roads behind which had become impassable, and there ran short of food. A thousand army rations were sent up and dumped by aeroplanes after having been divided up into parcels and packed in sacks of earth to break the fall. The waiting divisions prepared dumping grounds suitably marked, and here the provisions were dumped and were received without damage. In the course of a few hours thirteen tons of food were delivered in this way.



There is nothing very remarkable in all this, but it is at least an example of commonsense promptly indicating a somewhat unusual application of known powers. During the attempt to relieve Kut, food was, of course, dropped by aeroplane into the beleagured town. These afford, perhaps, the first examples of the use of aeroplanes as part of the equipment of an Army Service Corps.

The Army Service Corps may be described as the business and shopping department of the Army. It is essentially a commercial undertaking, though it is complicated by military conditions. The time may well come when aeroplanes will form part of the regular equipment of this gigantic business, and these first successful experiments may fairly be classified as temporary commercial aeroplane services.

There is a more obvious connection between ordinary commercial work and the carriage of food than between such work and the carriage of bombs.



A line of French Breguet Bombing Biplanes in the Breguet factory in France. French Official Photo

ELEMENTARY AERONAUTICS and MODEL NOTES

By John F. McMahon

Model Aeroplane Building as a Step to Aeronautical Engineering

CONTROL surfaces must now be considered. These differ according to the size and shape. As to size, in proportion, the same as for a wing section, the larger the surface, the greater the effect. The shape of the control will change the effect, as the efficiency varies according to the aspect ratio. For instance a flat plate with an aspect ratio of 1 or in other words as wide as it is long (square plate) would have a K_y of .00294 when placed at an angle of 30 degrees, while a plate with an aspect ratio of 9 (or nine times as long as it is wide) would have a K_y of .00210 for the same angle.

Of course, there is no comparison as to the proper shape of these plates, because when a designer dopes out a control surface, he must not only worry about the effectiveness of the section, but he must keep to a certain shape or size for constructional reasons, so a table of plates of different aspect ratios at angles from 5 to 60 degrees showing the K_y, K_x, and lift to drift at the different angles will follow.

Angle	K_y	K_x	L/D
	ASPECT RATIO = 1.		
5	.00045	.00007	6.3
10	.00097	.00019	5.1
20	.00208	.00074	2.8
30	.00294	.00173	1.7
45	.00207	.00210	.99
60	.00139	.00245	.57
	ASPECT RATIO = 2.		
6	.00074	.00010	7.5
10	.00123	.00021	5.9
20	.00247	.00091	2.7
30	.00178	.00111	1.7
40	.00169	.00146	1.2
60	.00126	.00225	.56
	ASPECT RATIO = 3.		
6	.00090	.00011	7.6
10	.00140	.00028	5.1
20	.00210	.00077	2.7
30	.00193	.00111	1.7
60	.00140	.00236	.59
	ASPECT RATIO = 6.		
6	.00109	.00018	6.3
10	.00173	.00034	5.2
20	.00199	.00074	2.7
30	.00204	.00120	1.7
60	.00141	.00244	.58
	ASPECT RATIO = 1½.		
10	.00109	.00020	5.6
20	.00215	.00070	2.8
30	.00198	.00095	1.7
40	.00183	.00152	1.2
60	.00127	.00226	.57
	ASPECT RATIO = ⅓.		
6	.00033	.00007	4.4
10	.00059	.00014	4.2
20	.00138	.00053	2.6
30	.00219	.00132	1.7
45	.00246	.00250	.98
60	.00155	.00264	.58
	ASPECT RATIO = ⅙.		
6	.00020	.00005	4.0
10	.00040	.00010	4.0
20	.00114	.00045	2.6
30	.00176	.00102	1.7
45	.00217	.00217	.99
60	.00163	.00282	.58

The method for using the above table is as follows: Suppose we are considering a rudder measuring 4 feet by 2 feet, and it was hinged along the longest side, then the aspect ratio would be 2. Now we look in the table under Aspect Ratio equals 2. We will say our rudder will be free to move so that when it reaches its farthest point it makes an angle of 30 degrees. Now the K_y at this angle is .00178 and to find the effect of this rudder at 60 M.P.H. we simply multiply .00178 by the total surface, 8 sq. ft. and this product by the velocity squared or $.00178 \times 8 \times 3600 = 51.26$ lbs.

Then this rudder will have a force of 51.26 lbs. working on it when traveling at 60 M.P.H. Now this is the force acting on the rudder but the steering effort produced is 51.26 multiplied by the distance in feet from the center of pressure of the main planes to the center of pressure of the rudder. Supposing this distance to be 12 feet, the force produced would be $12 \times 51.26 = 615.12$ lbs. Then the rudder would have a tendency to steer the machine equal to 615 lbs.

The tail plane, flaps and ailerons are also figured in this way. The effect of the ailerons being figured as acting a certain distance from the center of the machine out to the center of the ailerons instead of to the center of pressure.

The center of pressure at all angles for different aspect ratios can be found in the table below. This must be known, not only to correctly figure the force generated, but also to assist the designer in strengthening these facts properly, and which are generally strongest about this point. Again it is then possible to determine the strain on the control wires and to know just what size they must be to stand the strain.

For instance, the table says a plate aspect ratio = 3, at 17 degrees 13′ has the center of pressure located .4 of the chord from the leading edge, then a rudder 18″ wide would locate the center of pressure $18 \times .4 = 7.2$ inches from the leading edge. Supposing the rudder to have a force of 51 lbs., working on it at a distance of 7.2 inches from the leading edge when 30 degrees to the wind, and the rudder crank has a fastening for the wires 6″ from the base. Now to find the strain on the control wires we simply multiply $51 \times 7.2 = 367.2$ and divide this by 6 which gives us 61.2 lbs. pull on the controls. The factor of safety is generally regarded as 7, then by multiplying 61.2 lbs. by 7, we have 428.4 lbs. which is the strain the wire or cable is supposed to stand to be safe.

Distance of Center of Pressure from Leading Edge, Measured in Terms of Chord for Flat Plates of Various Aspect Ratios.

Aspect Ratio = 1		Aspect Ratio = 3		Aspect Ratio = 6	
Dist.	Angle	Dist.	Angle	Dist.	Angle
.12	.8	.233	5.0	.267	3.0

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

Flying over St. James's Park, a flight commander saw the band of the Guards in which he was formerly a subaltern. By dropping bolts and nuts, while nose-diving and ascending, he was able to play "God Save the King" on the kettle-drum!

* * *

They were flying over a bank of clouds, and the observer had not anything to observe at the moment. So he wrote on his pad and handed this thought to his pilot: "I wonder when this d——d old war is going to end." And the pilot, being a bit of a dog replied, "Can't tell when, but I do know where—in Berlin."

* * *

I have studied hard in the engine class,
And with math I have racked my brain,
With a penguin old I have cut the grass,
And I've ridden a practice plane.
I have taken a routine flight or two,
And may say that I'm not so bad,
But the glorious goal that I have in view
Is to pilot a combat spad.

* * *

This story is funny to most people. To one fellow in particular it is pathetic. He is a young S. C. up north who, when he saw a machine make a bad landing left wing down, swore at the occupant and told him to go upstairs again and come down properly. The pilot did as he was told, made a perfect landing, and introduced himself as General X, who flies round occasionally to aerodromes on a visit of inspection in his own 'bus.

* * *

Extract from a feuilleton by a lady novelist: "Seizing his joy-stick, Captain Fitz-Herbert waved it defiantly at the Hun in the Albatross, then, looping the loop with his Handley Page, he zoomed over his opponent and drove him into an air pocket from which there was no escape."

* * *

PILOT—No, we have no answer to correspondents column, but we don't mind obliging for once in the circumstances. When the French colonel decorates you, it is not advisable to kiss him back. He has more experience in this sort of thing than you, and you might get the worst of it. Just salute, and try to look modest, Pilot. * * *

It was his first day in a sausage, and he was not any too sure of his chances with the parachute if it came to a jump.

"Wonder where a fellow would land if he elected to stay in the car," he mused.

"Any idea, Bill?"

And Bill, with a sigh at the thought of a hundred and one similar questions already answered, spoke thusly: "Ain't yer never bin to Sunday school, then?"

* * *

"Have you heard that Muriel is anxious to be the first woman in America to become an aerial post-girl?"

Her Friend: "I quite believe it. She always was a flighty minx."

* * *

There was a young man from (deleted)
Who up in an aeroplane was seated,
His bombs he threw down
On old Mannheim town,
And its output was sadly depleted.

* * *

There was an old man of Mannheim,
Who said, "What a deuce of a time
We've been having round here,
And it fills me with fear,
For the bombs are as bad as my rhyme."

* * *

"And did the German colonel look terrified when you swooped down on him?"

"Look terrified! Why, if he'd had a single feather in his hand, he'd have flown." * * *

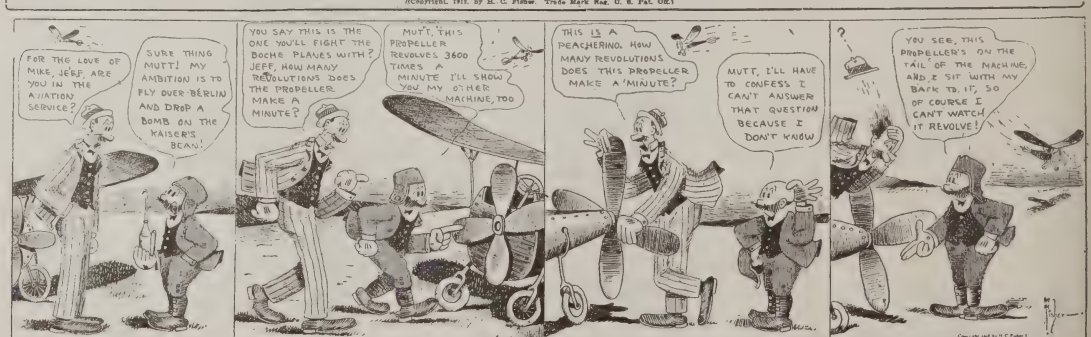
Georgie Washington the Second
To his airman father beckoned,
Pointed to the joy-stick broken
Rudder smashed, and by your token
Whispered "No one here to watch it,
So I tried my little hatchet."

* * *

A press photographer was induced to make his first flight in an aeroplane and took a photograph or two in the air. Asked when he came down if he looked upon the trip as a success, the naughty lad replied, "The answer is in the negative."

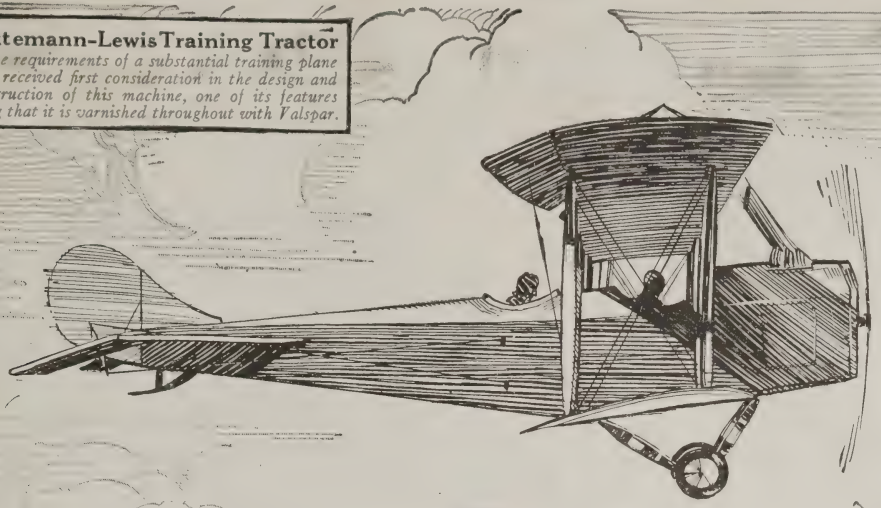
Great Stuff for the Kiddies

The Government has announced, sayeth the press, that all castor oil must be conserved for the use of army aeroplanes. Why couldn't it a-happened when we were young?



The Truth at Last

Latest news in the moving-picture world is to the effect that camera squadrons are busy taking war pictures on the Flanders and Picardy fronts in the outskirts of Los Angeles.—*Rochester Post-Express.*



And sometimes conscientious correspondents get some thrilling battle-scenes back in the peaceful S. O. S. of France. Barnum was right.

MUTT AND JEFF—Jeff Not Only Has Good Eyesight but He's a Fast Counter . By BUD FISHER

(Copyright, 1918, by H. C. Fisher. Trade Mark Reg. U. S. Pat. Off.)

Wittemann-Lewis Training Tractor
The requirements of a substantial training plane have received first consideration in the design and construction of this machine, one of its features being that it is varnished throughout with Valspar.

Wittemann-Lewis say
Valspar gives best results

"WITH reference to your Valspar Varnish, as well as other paints which we have used for several years, would say they have given us the very best of results, and take pleasure in advising you that *wing surfaces that have been varnished with your Valspar varnish as long as a year and nine months ago are still in a perfectly pliable and healthy condition.*"

WITTEMANN-LEWIS AIRCRAFT CO.
Newark, N. J., Sept. 12, 1918 (Signed) Paul W. Wittemann,
Treasurer.

VALSPAR is waterproof and weatherproof. It will not turn white or blister with exposure. It protects wood, metal or fabric with equal reliability. It is durable beyond all ordinary varnishes.

Valspar is universally accepted as the standard airplane and seaplane varnish.

Our Airplane Department willingly places its experience at the disposal of all airplane and seaplane manufacturers.

To purchasing agents and superintendents of production a valuable book full of information on airplane finishing will be sent free on request.

VALENTINE'S
VALSPAR
The Varnish That Won't Turn White

Valentine Products used by the world's leading airplane-makers include: Valspar Varnish, Valspar Bristol Enamel, Valspar Low Visibility Gray Enamel, Valspar Olive-Drab Enamel, Valspar Black Enamel, Valspar Filler (Wood), Valspar Primer (Metal), Valspar Primer (Wood), Valspar Khaki Enamel, Valspar Aluminum Paint. Dipping, Spraying, and Brushing coatings of all kinds, Quick-Drying Insignia Colors.

THE NATIONAL TECHNICAL AND TRADE AUTHORITY

THE EDITORIAL CONTENTS

Printing the largest amount of editorial material, the editorial contents of AERIAL AGE include:

1. Editorials presenting always constructive suggestions concerning the substantial upbuilding of the American aeronautic industry.
2. Comprehensive and complete Trade and General news of the week from every point of the compass.
3. Technical contributions from leading authorities in the aeronautic world on aeroplanes, aero-motors and every other phase of aeronautics.
4. The complete official reports of the Army and Navy Air Services and published weekly together with articles by authorities on Military and Naval aeronautics, thereby insuring to the readers and advertisers a more complete representation of Army and Navy aeronautics than is afforded by any other publication in the United States.
5. A regular department presenting each week some important phase of military aerostatics, being the only magazine in the world to have such a department.
6. Complete reports concerning current aeronautic standardization work here and abroad.
7. Personal notes concerning the men upbuilding the aeronautic industry's affairs.
8. A digest presenting important events of the air services on the war fronts.
9. A page every week for the model enthusiast, giving views of the clubs and construction information.
10. A specially appropriate department in the French and English languages, giving valuable information and table, which our men who go overseas find most advantageous.
11. Last, but not least, a page of aeronautical humor in verse, prose and illustration.

ITS CLIENTELE—AERIAL AGE is read:

1. By **the Executive Heads** of every aeronautical concern in the country who relies upon its contents to inform him concerning the constantly increasing progress of the aeronautic industry.
2. By **the Executive, Engineering and Purchasing Military Authorities** of the United States and the Eighteen Allied Countries, and nine Latin-American countries who have severed their connections with Germany.
3. By **the Engineer** who looks upon it as the medium of information concerning every development of technical importance.
4. By **the Designer** who is made familiar with current progress throughout the world by articles, illustrations, and diagrams contributed by the world's technical experts.
5. By **the Purchasing Agent** who, in its advertising pages, finds a directory which gives the best and the latest products of the aeronautic industry.
6. By the Capitalist and progressive business men who recognize the fact that aeronautics, now one of the key industries, who look to AERIAL AGE for the opportunities afforded by the aeronautic industry, and to AERIAL AGE'S Service and Advisory Department for advice regarding investments.
7. By the Air Service Student who acquires a broad knowledge of what is happening in the Air Services in the United States, and Europe, and for whom we print special articles in French describing the machines with which he will require to become familiar.
8. By the Layman interested in aeronautics, who desires to be kept constantly and correctly informed on the current developments in the Aeronautic Industry and Movement.
9. By **the Juvenile Student** who is interested in model construction and for whom we print special articles of informative value. He will be the expert and the purchaser of the near future.

(*Continued from page 618*)

'On April 6 the location of the Aldis sight was removed and changed to the left hand side of the right gun; this necessitating a change of all the parts which had been made up for the old sight and which were already released to production.

'Our first instructions regarding the bomb dropping gear were to equip the DeHaviland machine with two rails similar to the English machine. Information had continually been requested on bombing apparatus but no drawings could be furnished. On January 18 we received our first information from the Ordnance Department on Bomb Gear. This was merely an unlocking device and we gave space in our drafting room for several Ordnance Department men to complete their drawings for application to the machine, they being turned over to me on February 1. On going over these drawings, it was found that they were not complete and about a week or more later more drawings were received which assisted in production of the first model gear. The delivery of this apparatus has been sadly deficient, it being necessary to ship a large number of planes without it, as some of this is built in the floor of the fuselage and must be put in during the various assembly operations. A further change on the operating mechanism of the bombing gear is coming through which will be incorporated possibly on the five hundredth machine.

"Information was requested during October, 1917, on the camera and camera mounts. We were advised at that time that the camera mount which the English DeHaviland was equipped with would also be used on the American made machine. On January 19 we received from the Signal Corps a camera which would not fit the English mount. As the English mount was already built into a number of our fuselages, it was impossible for us to change this part on our early shipments. A new design of mount was made by the Signal Corps and installed in the sample machine in our shop. On February 25 this was rejected by the Signal Corps and a new design started and drawings furnished on some May 27.

"The focusing lense retainers were designed at the direction of the Signal Corps for a 4" x 5" lense. The location of these were shifted several times and the size of the lense was changed by the Signal Corps to 5" x 6" and the drawings for retainers were furnished on April 2.

"Up to February 14, we had no information on Oxygen apparatus except that it was to be part of the equipment. As late as April 6, we had no samples of the apparatus or drawings showing installation of same. Final approval of the oxygen installed was received June 10.

"Drawings for the radio equipment and first information regarding same came to us February 1. These were recalled for changes and new set issued which were illegible. These were returned and on February 8 a new set of drawings were received for the bonding together of all metal parts on the machine; these drawings could not be followed on a production basis. The Dayton Wright Company then prepared a sample machine and drawings were made from this and accepted by the Signal Corps March 25. Radio instruments were received February 20 and installation according to Signal Corps drawings were stopped February 25 and new installation directed. The Dayton Wright Company prepared drawings for this installation and wiring according to the sample which was prepared.

"On March 28 the generator mount on the side of the fuselage was abandoned. A new installation was furnished by the Signal Corps but was found that it interfered with the landing gear strut. On April 10 the new design from the Signal Corps showing the correct location of the generator was received.

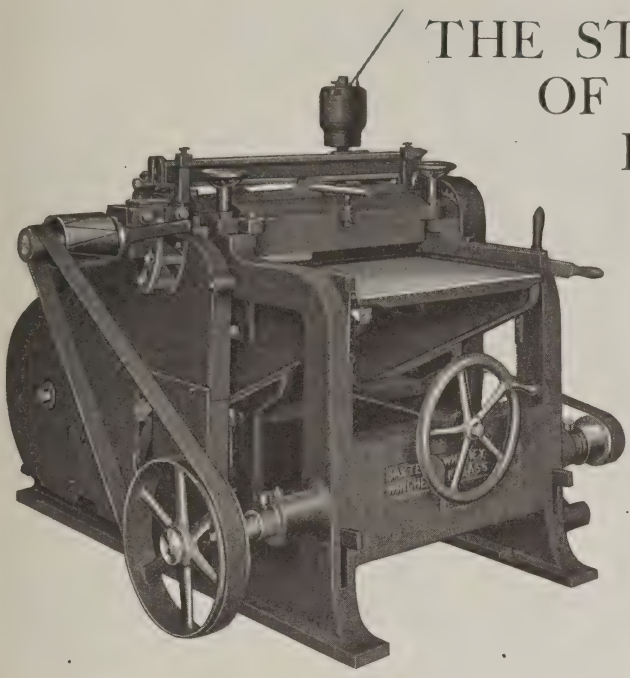
"Considerable trouble was encountered with the installation of the Holt flare lamps as there was a misunderstanding between the Dayton Wright Company and Signal Corps as to who was to furnish them. The first Holt flare lights were received on February 25.

"The first navigation light samples were received on March 20 and wiring instructions for same were delivered a few days later.

"The electric generator for lighting and heating was received on March 15. The Signal Corps drawings showed the location on the side of the fuselage. This was unsatisfactory as the generator propeller interfered with the rear flying wires of the wing structure. The Signal Corps prepared new drawings for the re-locating of this generator but these were unsatisfactory owing to the interference with the landing gear strut. On April 9 a new set of drawings were received showing the correct location of this generator.

"Radiator and water lines were approved by the Aeroplane Engineering Department, Signal Corps on November 21 after flying test. At this time, of course, there was practically no information at hand regarding the equipment of the DeHaviland plane which necessarily added considerable weight, so that the radiators which we had ordered for production were considered unsatisfactory by the Production Engineering Division. The radiators furnished by the Signal Corps were 1" deeper in the core which necessitated re-design of the shutter assembly. At a late date it was decided to make a further change on radiator design, making it 4" longer. This affected the under cowling of the motor, the forward cowling, water lines and numerous other details entailing a large amount of scrappage and re-operation of parts.

"The Signal Corps advised that they would furnish us short radiators for our first 150 ships and long radiators for the next 100, after which we were to supply our own. A shortage of 50 radiators was encountered in the first agreement which necessitated us going to the long radiator job 50 machines earlier, which caused a serious delay and complication in the shop.



"Drawings were received from the Aeroplane Engineering Division, Signal Corps, November 21 on gas and air lines. From these drawings all parts were ordered into production. All gas and air line connections were changed by the Signal Corps and final information received on this change April 5. This necessitated scrappage of all parts on hand and a delay was occasioned in securing necessary raw material."

The delays at the plant of the Dayton Wright Aeroplane Company, due to these changes in design, also caused delay in the other plants which were to produce DeHaviland 4s, for both the Fisher Body Corporation and the Standard Aircraft Corporation were awaiting a definite design and a determination of equipment and proper drawings before proceeding to production. The Dayton Wright Aeroplane Company was in advance simply because it had the advantage of the posession of the model and it was working out the necessary drawings.

It will be observed that these changes were required in the course of production. That is, instead of proceding with production on the basis of a given equipment where changes in equipment would cause serious delay, and introducing different equipment in the planes subsequently produced, virtually the entire production was held up to accommodate the new demands. As Lt.-Col. Horner testifies, "We would go on changing this way and that way and let that change go through production, when it could be done without interfering with production, and if we had done it we would have had a thousand more planes on the French front today than we now have without any question."

It is unnecessary to review the changes in the ill-fated Bristol. They were numerous and related to the structure of the plane itself. Production was of course impossible while these changes were in progress. The real effect of the changes, however, in view of the result, was not to retard the production of a useful plane, but to cause an unnecessary expenditure.

(*To be continued*)

THE STRONG POINTS OF WHITNEY PLANERS

appeal to every wood-worker, such as a

RIGID FRAME with ample weight of metal—

BED raised and lowered on Solid Wedges operated on wide tracks—

HARDENED CENTER TABLE made extra thick—

AUTOMATIC CHIPBREAKER working concentric with the Cutter Head—

CLAMP CUTTER-HEAD BOXES easily removed from the machine—

CUTTER HEAD with long bearings of large diameter.

These are but a few of the features that enable Whitney Surfacers to do superior surfacing at the lowest cost.

The Curtis Dreadnaught Propeller Cutting Machine, Model 55

THIS machine cuts four blades at a time, and cuts closer and more accurate than any other machine in the market.

It finishes the hub the same as all other parts of the blade.

It cuts with the grain of the wood.

It does not require a metal model; just a regular stock blade is sufficient.

It does not bump over the pattern.

It is manually operated, which gives it the advantage of the human touch required on accurate work.

The hand work required after this machine is from 3½ to 4½ hours on each blade.

It leaves just enough wood for cleaning up.

(*Continued from page* 615)

the rubber cord is thus much stretched the bombs are hung in. When the upper gear wheel is now released by pulling the locking lever for bomb-dropping, the stretched rubber cord starts turning the shaft lying across in the fuselage as well as the camshafts of the bomb stores, so that all bombs are released by one revolution. To enable a timing of the bomb-dropping a glycerine brake cylinder, with adjustable throttle valve, is mounted in the chain drive leading upwards. Being connected with the inner bomb pairs and fixed to both sides of the seat two special cables make the dropping of these four bombs possible independently of the rest.

One aeroplane has further had a hanging provision for two large bombs mounted inside the cockpit to right of the seat of the pilot. The cables run to the observer.

The aiming arrangement is mounted inside the observer's cockpit on a swivelling arm on the left body side.

The empty weight of the aeroplane was fixed at 1,215 kg. A notice on the rudder gives the weight of the fuel at 216 kg., that of the normal useful load to 514 kg. and the maximum useful load at 614 kg. Reckoning with the normal load the total weight of the aeroplane loaded is thus 1,915 kg., corresponding with a load on the plans of 40 kg. per sq. m., as well as a performance load of 300 h.p. of 6½ kg. per h.p.

Characteristic Features

Beside the usual backwards stagger to be found on other aeroplanes the following features should be emphasized; the high fuselage with the right-angled rudder and forward sharp rounded keel fin, the landing gear with three pairs of struts and a right-angled cutting of the streamlining of the shafts, the small arrow-shape of the trapeze-shaped planes with the sharp and large cuttings, the bomb stores projecting forwards in front of the planes, the triangular-fixed tail plane, the divided elevator, with cornered balance, as well as the dihedral upper planes and horizontal lower ones.

(*Continued from page* 634)

the electrode froze to the work without releasing, at the same time operated easily for voluntary release.

The tool which resulted from these studies is shown in the accompanying illustration. The welding current enters at the rear end of the composition shank, passes along the shank to the head of the tool, and from there directly into the electrode. It will be noted that there are no joints in this tool except where the cable is soldered into the shank. Therefore, heating due to contact resistances cannot occur. There is a relatively large contact surface between the electrode and the holding head, which precludes any possible heating at this point. The electrode is clamped by a spiral segment operated by a lever. The lever is thrown to the widest open position and the electrode inserted, when the lever is turnd in the opposite direction as far as it will go. Any attempt to pull out the electrode results in tightening the grip of the segment which is made of case-hardened steel. This welding tool is covered by patents.

The trigger is intended for remote control employed with the closed-circuit system, manufactured by the Arc Welding Machine Company, Inc. Whenever this holder is used on other systems, the trigger is omitted, otherwise it is the same.

Aviators to Thread Needle of Liberty

According to a despatch to the New York *Sun*, "Threading the Needle of Liberty" is now a practice problem for aviators who expect to participate in the grand military procession in Paris in the near future and which will pass through the famous Arc de Triomphe de l'Etoile, from which twelve great boulevards radiate.

The space connecting the Avenue de la Grande Armee with the Champs Elysees is only ninety feet high and forty-five feet wide and the birdmen's tests are being made at a distant aviation field between and under wooden posts with specially constructed planes that have a diminished spread of wings.

The aviators intend to pass through the arch the same as the infantry and artillery.

Aeroplane Prize Authorized

Major General William L. Kenly, Director of Military Aeronautics, issued an order recently permitting the Aero Club of America to award to Sergeant M. F. Coombs, winner of the aeroplane race about the Statue of Liberty on October 26, the $100 Liberty Bond offered as a prize in the event.

A Novel Idea

The War Department authorizes the following:

Potato races in the air are being used by instructors at flying fields in teaching cadets accuracy and quickness in flights. In a potato race each team consists of a pilot and a mechanic. They are assigned to a plane and fly from the main landing field of a school to each of the outlying fields in turn, making a landing at each field to pick up a potato and returning to the main landing field to deposite it. At each of the outlying fields is a whitewashed mark on the ground before which each of the ships in the contest must land. If the pilot taxies over this mark before he stops he must take the air, come back and try it over again. Rules of the contest also require the mechanic to climb out of the ship at each mark, pick up his potato and climb back into the ship. In a recent potato race at one of the fields in Texas the distance traveled was twenty-four miles, the planes flying to three outlying fields and back each time to the main field. The winning plane covered the distance, made its landings successfully, picked up all its potatoes and deposited them in exactly forty minutes.

WELCOME HOME!

THE first troops to return to the United States were aero squadrons from France and England.

They received a hearty welcome from the nation as a whole and especially from the aeronautic authorities who would have entertained the members of the returning aero squadrons extensively and made them feel how thoroughly their work overseas had been appreciated had it not been for the restrictions placed by the medical authorities, who very wisely decided on measures intended to protect the public health.

The Aero Club of America, Aerial League of America, and the Aerial Mail Services joined in welcoming the returned aero squadrons. A wireless message was sent to them while the ship was on the way welcoming them back home and extending to them the hospitality of the Aero Club of America, at the same time making known the possibilities of many of the aviators finding positions in the aerial mail service.

On the morning of December 2nd, when the Mauretania arrived, the first boat to reach her was that carrying the Aero Club of America, Aerial League of America, and Aerial Mail authorities. The reception committee included Alan R. Hawley, president of the club; Rear Admiral Bradley A. Fiske, Henry Woodhouse, Capt. Benj. C. Lipsner, first superintendent Aerial Mail Service; Henry A. Wise Wood, Col. Jefferson DeMont Thompson, head of the aviation section of the New York Police Department; Hon. Murray Hurlburt, Commissioner of Docks in New York City; K. M. Turner, G. Douglas Wardrop, managing editor of AERIAL AGE; Mrs. Allen H. Bartlett, chairman of the aviation committee of the National Special Aid Society; Mrs. Henry A. Wise Wood, Capt. Robert A. Bartlett, W. W. Miller, Charles Jerome Edwards, Augustus Post, Evan J. David, business manager of *Flying;* Major J. C. McCoy, Miss Harriet C. Wirth, Mr. LeRoy B. Gulotta, Harry B. Childs, N. J. McNulty, Lieut. M. B. Downs. They received a very hearty reception. The upper decks of the Mauretania were alive with uniforms and as the boat drew near and the aviators learned that the officials of the Aero Club of America, the Aerial League of America and the Aerial Mail Service were on board the cheering was lusty and prolonged.

One by one the aeronautic authorities were introduced by megaphone and each time the returning aero squadrons cheered. Then at the first blow a number of voices from the Mauretania shouted "Is New York still wet?" With one voice those on the boat shouted "Yes," and the cheering which followed showed that the aero squadrons had not been living in France in vain.

The next query was: "Is there plenty to eat?" to which Mr. Augustus Post answered "Yes, and if you don't believe it come to the Aero Club of America and find out for yourself." This was received with a roar of approval. Mr. Post explained further that the invitation would be good for many months to come. If they wanted to go home upon their release from the service they were welcome to take advantage of the invitation at any time subsequent that was convenient.

Another cheerful announcement greeted with applause was the announcement of Captain Lipsner, the first superintendent of the Aerial Mail, advising the aero squadron units that there would be many positions in the aerial mail service opening for them. Prolonged cheering followed this announcement and showed that many of the members had been worrying over the prospects of remaining in the movement.

At about this time the second boat carrying the officials of the city of New York arrived. There was renewed cheering. The official boat contained many other members of the Aero Club of America. The city committee included the following:

Mayor Hylan, Mrs. Hylan, Acting Police Commissioner John A. Leach, Rodman Wanamaker, Commissioner of Charities Bird S. Coler, Grover Whalen, Secretary to the Mayor; Michael Cosgrove, Deputy Commissioner of Docks and Ferries, and other city officials.

The various units on the Mauretania were as follows:

156th Aero Squadron—Second Lieut. Arthur A. Sack, Second Lieut. John A. Bryan, Second Lieut. Richard M. Harris.

167th Aero Squadron—First Lieut. Barlar Thompson, Second Lieut. Arthur J. Wheeler.

187th Aeo Squadron—First Lieut. Loren B. Roberts, Second Lieut. Richard C. Philblad, Second Lieut. Richard M. Ferrill.

188th Aero Squadron—Second Lieut. Lock W. Redd, Second Lieut. Herman W. Berning.

216th Aero Squadron—First Lieut. Thomas B. Lyons, Second Lieut. Joseph P. Chapman, Second Lieut. George E. Fenderson.

225th Aero Squadron—Second Lieut. Brooks Dudley, Second Lieut. William B. Alexander.

226th Aero Squadron—First Lieut. R. Julian R. Speyers, Second Lieut. Philander P. Scroggs, Second Lieut. Leo C. Watson, Second Lieut. Max A. Montgomery.

228th Aero Squadron—First Lieut. James R. Ashley, Second Lieut. Wilson G. Fleming, Second Lieut. George P. Kirby.

262nd Aero Squadron—First Lieut. Walter A. Lorah, Second Lieut. Otis H. Castle, Second Lieut. Einer L. Rolfson.

267th Aero Squadron—First Lieut. F. W. Bedcher, Second Lieut. Lester E. Cadman, Second Lieut. Bethell Edrington.

268th Aero Squadron—Second Lieut. Peter V. O. Barkelow, Second Lieut. James F. Callahan.

308th Aero Squadron—Capt. Frederick R. Randall, First Lieut. Kirby Fitzpatrick, First Lieut. Alexander H. Clarke, Second Lieut. Julius H. Nussbaum, Second Lieut. Garner K. Birdseye.

309th Aero Squadron—Capt. Cecil Van Auber, Capt. Ralph R. Bush, First Lieut. James W. Tinsley.

310th Aero Squadron—Capt. Alfred J. Hayhurst, First Lieut. Edmund Easters.

315th Aero Squadron—First Lieut. Harold H. Healy, Second Lieut. Walter A. Crowe.

316th Aero Squadron—First Lieut. William F. Le Baron, Second Lieut. Victor A. Le Noir, Second Lieut. Leo N. Sinner.

317th Aero Squadron—First Lieut. Ray T. Morgan, First Lieut. Eugene Ferry Smith.

319th Aero Squadron—First Lieut. Arthur M. Beach, First Lieut. Arthur D. Farquhar, Second Lieut. John Sunderland, Jr.

321st Aero Squadron—First Lieut. Malcolm Lucas, Second Lieut. Thomas J. Carroll, Second Lieut. John Q. Cunning.

325th Aero Squadron—First Lieut. Richard A. Smith, Second Lieut. William E. Karns, Second Lieut. Roy D. Wilcox.

329th Aero Squadron—First Lieut. Cornelius N. Caddagan, Second Lieut. Martin B. Kugler, Second Lieut. Walter T. Hubbard, Jr., Second Lieut. Otto L. Weidmann.

330th Aero Squadron—First Lieut. Clarence J. Gilbert, Second Lieut. Leslie C. McClelland.

331st Aero Squadron—First Lieut. Taylor H. Stukes, Second Lieut. William P. Boyd.

333rd Aero Squadron—First Lieut. Willis K. Zachery, Second Lieut. Paul T. Putnam, Second Lieut. Walter W. Longstreth.

5th Construction Bricklayers' Company—First Lieut. Bernard J. O'Rourke, Second Lieut. Mitchell Allen, Second Lieut. Ralph Bryan.

Radio Mechanics Detachments—Second Lieut. Stephen M. Lee.

All efforts are being made by the Aerial League of America, in cooperation with the Aero Club of America and the Post Office, to secure positions for those of the aviators who may be leaving the service in the near future. The Aerial League has established an employment bureau at 297 Madison Avnue, New York City, where special blanks and information may be secured by aviators desiring to enter either the industrial end of the service or the Postal Mail Service.

NINETY AIR STATIONS NAVY PLAN FOR COAST DEFENSE

AERIAL defense of the American coast line is an important part of the plans of the Navy Department the House Naval Affairs Committee was informed to-day by Capt. Steele, U. S. N. Air Service, and Rear Admiral Taylor, chief of the Bureau of Construction and Repair.

It is planned to have ninety stations, distributed between the Atlantic and Pacific coasts and including Panama, Hawaii, Guam, Alaska and the Philippines, where triplanes, which can develop 160 miles an hour, and dirigibles, some of the Zeppelin type, will base. The cost is estimated at $85,769,300 for the next fiscal year. The fleet of dirigibles would include four huge ships of the rigid type, costing $1,500,000 each, twelve smaller balloons to cost about $250,000 each and a number of still smaller type costing $75,000 each.

Cost of Operating Stations

The operation of the coastal stations would cost about $8,000,000 Captain Steele said. Training stations would require $3,000,000 more, and experimental stations another $3,000,000. Captain Steele gave the following list of stations established or planned and the number of planes each would require:

Chatham, Mass., 24; Narragansett Bay, R. I., 24; Rockaway Beach, 24; Cape May, N. J., 18; Hampton Roads, Va., 24; Cape Lookout, N. C., 12; Brunswick, Ga., 18; Miami, Fla., 12; Key West, Fla., 24; Galveston, Tex., 24; Panama Canal Zone, 24; St. Thomas, W. I., 12; San Francisco, 24; San Diego, Cal., 24; Seward, Alaska, 6; Pearl Harbor, Hawaii, 24; Hilo, Hawaii, 12; Guam, 12; Cavite, P. I., 12.

Besides these, Fort Angelus, Wash., and the mouth of the Columbia River are in mind as possible stations.

The Navy Department's original estimate for air service had been $225,000,000, but the signing of the armistice resulted in the cut. Captain Steele insisted that the air estimates were based on a peace, not war, plan.

The Navy Department, Captain Steele intimated, is certain that protecting the Pacific coast will not now be misconstrued by Japan. In addition to the bases on that coast it is planned to have twenty-five "rest stations" for the storage of aircraft fuel and supplies and to provide landing places.

The amount asked by the navy in its revised estimates for aeroplanes is $8,162,000, Admiral Taylor said.

The value of the Zeppelin type of aircraft was questioned by members of the committee. Admiral Taylor said that a German machine of this type had flown during the war from Berlin to German East Africa. He predicted intercontinental flights in the near future of such craft.

"When the war started we were far behind on aircraft," the Admiral said. "During the war we were able to catch up to some extent. The general board feels that we should continue with our preparations."

The extremely fast, big triplane the navy wants is known as the Curtiss-Kirkham, because it uses an engine of that name instead of the Liberty motor. It is proposed to construct 108 fighting escort planes alone at a cost of $10,000 each.

NEW YORK POLICE DEPARTMENT TAKES PIONEER STEP CREATING AVIATION SECTION

THE creation of an Aviation Section in the New York Police Department and the appointment by Police Commissioner Richard Enright of Colonel Jefferson DeMont Thompson as head of this new Section, became known today through an impromptu luncheon given to Col. Thompson at the Aero Club of America by Messrs. Alan R. Hawley, President of the Aero Club of America, Henry Woodhouse, Rear Admiral Fiske, Henry A. Wise Wood, Augustus Post, and Captain Robert A. Bartlett, the famous explorer.

Mr. Hawley pointed out the importance of this step in the following statement:

"We fully agree with both Commissioner Enright, Special Deputy Police Commissioner Rodman Wanamaker, Inspector Dwyer, Special Deputy Police Commissioner Allan A. Ryan and the other progressive police authorities, that with this very progressive step of Police Commissioner Enright New York City gains the distinction of being the first city in the world to have an Aviation Section connected with its police department.

"The fundamental importance of the Aviation Section is quickly appreciated when the many duties of the Police Department are considered. The work of the aviators in connection with directing the protection of communities surrounding Morgan, New Jersey, during the recent catastrophe, when the fire threatened to set on fire tons of TNT, which might have caused the destruction of the subways and buildings even in New York City, emphasized the necessity of having aviators available for such emergencies.

"The work of policing the rivers, Harbor and Bay is also of tremendous importance and the problems connected with same will be easily solved by the employment of aircraft."

These are only two of the various uses to which aircraft can be put in connection with the Police Department, but they are sufficient to indicate the importance of the newly created Aviation Section of the Police Department.

The appointment of Jefferson DeMont Thompson as head of the Aviation Section of the New York Police Department was made on Saturday by Police Commissioner Enright.

All the high police authorities are known to be greatly interested in aviation. Police Commissioner Enright has also shown a keen interest in aviation. Special Deputy Police Commissioner Rodman Wanamaker, it will be recalled, has been a veteran supporter of aeronautics. His interest dates back to 1909, when he purchased and brought to the United States a Bleauriot monoplane of the type in which Louis Bleauriot, the famous French pioneer, flew across the English Channel.

Mr. Wanamaker also acquired one of the first balloons purchased in the United States. Later, in 1914, Mr. Wanamaker ordered the first transatlantic seaplane and organized the transatlantic flight, which was prevented by the war.

In 1915 he presented to the Aero Club of America, of which he has been a member and officer since 1909, a large balloon, which was later used to train the first United States Army balloon pilots to go overseas.

It is understood that the idea of establishing an Aviation Section for the New York Police originated with Deputy Commissioner Wanamaker and had the prompt approval of Commissioner Enright.

Special Deputy Commissioner Allan A. Ryan, also is a veteran of the aeronautic movement. He has been a Life Member of the Aero Club of America since 1910, and was President of the Club in 1910-1911, and was in charge of the organization of the first International Aviation Meet at Belmont Park in 1910, at which time Mr. Thomas F. Ryan gave a prize of $10,000 for the race to the Statue of Liberty.

Inspector Edwin F. Dwyer, Special Deputy Commissioner Wallat, Dr. John A. Harris, Special Traffic Commissioner, and other officials of the Police Department and city authorities are also keenly interested in aeronautics.

Colonel Jefferson DeMont Thompson's interest in aeronautics dates back to 1905, when the Aero Club of America was founded. He was one of the Founder Members, just as he had been a Founder Member of the Automobile Club of America. He studied aeronautics and officiated in aeronautic meetings in Europe before the war. He also was a pioneer in the automobile movement, being the chairman of the Vander-

bilt Cup Commission from the date of its organization and for a number of years thereafter.

Colonel Thompson has gained national reputation as a traffic expert and was a member of the Traffic Committee under Mayor Mitchell and was appointed Vice Chairman of the Traffic Committee by Mayor Hylan.

He is president of the Broadway Association, a Founder Member of the Aero Club of America and the Automobile Club of America, a member of the Union League Club, and other clubs and associations.

He was Chairman of the committee having charge of aeronautic events in the different city ceremonies and events, including the Liberty Loans and Fourth of July Parade, when over 100 military aroplanes flew over the city dropping prospectus.

The appointment of Colonel Thompson in charge of the Aviation Section of the New York Police received an enthusiastic reception at the Aero Club of America and Colonel Thompson was heartily congratulated by the officials and members of the Club and of the Aerial League of America, including Messrs. Alan R. Hawley, President, Robert E. Peary, President of the Aerial League of America and discoverer of the North Pole, Major J. C. McCoy, Dock Commissioner Murray Hulbert; Messrs. Charles Jerome Edwards, Henry A. Wise Wood, Rear Admiral Bradley A. Fiske, Henry Woodhouse, W. W. Miller and John Hays Hammond, Jr., members of the Board of Governors of the Aero Club of America, Capt. Benjamin B. Lipsner, first Superintendent of the Aerial Mail Service, and Captain Robert A. Bartlett, the famous explorer, and Mr. Augustus Post, Secretary of the Club.

The Aero Club officials and Captain Benjamin B. Lipsner, first Superintendent of the Aerial Mail Service, assured Colonel Thompson of the hearty co-operation of the Club and the Post Office, respectively.

FIRST THANKSGIVING DINNER IN AN AEROPLANE

THE first Thanksgiving ceremony and dinner ever held on board of an aeroplane was held on November 28, at one o'clock on board of the large three-ton Handley Page belonging to the Post Office, and to be used early in December in the New York-Chicago aerial mail line.

This event took place at Elizabeth, New Jersey, the newly established aerial mail center. Those who had luncheon on board of the Handley Page were:

Alan R. Hawley, President, Aero Club of America; Captain Benjamin B. Lipsner, Superintendent, Aerial Mail Service; Henry Woodhouse, Editor of AERIAL AGE; Augustus Post, Secretary, Aerial League of America; E. S. Pennewill, Vice-President, Standard Aircraft Corporation; Mr. Meyrick, Standard Aircraft Corporation; Leroy B. Gulotta, Editor of *Air Power*.

The following telegram was written on board of the huge aerial mail plane:

"We who are having Thanksgiving ceremony and dinner on board of the three-ton Handley Page postoffice mail aeroplane, extend our heartiest congratulations on inauguration of the Aerial Age by the postoffice department. A new epoch has dawned for the commerce of America and of the whole world. We all join in Thanksgiving for the stupendous victory achieved and for the realization of our hopes, which we confidently believe will be soon followed by results of the utmost benefit to civilization when the marvelous develpments in military aeronautics are turned to utilitarian purposes and aerial mail service is established throughout the United States."

The above telegram was sent to President Wilson, Secretary Baker, Secretary Daniels, General William L. Kenly, Director of Military Aeronautics, Washington; Postmaster-

(*Continued on page* 673)

The Handley Page that housed the group of aeronautic enthusiasts on the above historic occasion.

THE NEWS OF THE WEEK

Seaplane Carries Fifty Passengers

A record in this country for the number of passengers carried was broken on November 27 at the naval aero station at Rockaway, when the NC-1, the largest seaplane in the world, made a flight carrying fifty passengers. In the test flight the pilot was Lieutenant David H. McCullough, Naval Reserve Flying Corps, a veteran who was in charge of Aerial Coast Patrol Unit 1, and trained F. Trubee Davison and H. P. Davison, Jr., and other aviators who afterward won reputation in the service.

No special modifications of the plane were made for the flight, which was made to demonstrate the machine's lifting power. The NC-1 is the first American tri-motored seaplane. She is of the flying boat type with wings that have a spread of 126 feet, and is equipped with three low compression Liberty motors of 385 horse power each, giving her a speed of about 80 miles an hour. With the weight of fifty passengers this speed was cut down to 72 miles an hour.

It was designed and construtced by the Curtiss Engineering Corporation at Garden City.

The test was witnessed by a crowd, and, according to a report of the Aero Club, the NC-1, with her great weight, was able to leave the water within 1,000 feet at a speed of forty-five knots, and rose to a height of thirty-five feet. The record, it was said, was all the more remarkable because it was made in a seaplane of a type that is usually 10 per cent heavier than land aeroplanes.

"The flight, which was made at Rockaway Beach," said Alan R. Hawley, President of the Aero Club of America, "was witnessed by an official of the Aero Club of America, and the record will come up for homolgation at the regular meeting of the Executive Committee next Wednesday. When this is done it will be sent to the Aero Clubs of all the European and Latin-American countries, which are affiliated with the International Aeronautic Federation and the Pan American Aeronautic Federation, and, therefore, it will be considered official all over the world. This is a splendid achievement, and the Navy Department is to be congratulated for it."

Henry Woodhouse: "This is the first passenger-carrying record in which more than twenty-five passengers have been carried, officially observed, that has been made since the beginning of the war. The first world record, carrying twenty-one passengers, was made in Great Britain in 1918, when a land Handley Page carrying twenty-one passengers flew to a height of more than 7,000 feet, piloted by Clifford B. Prodger, an American pilot. In September, 1917, a Caproni triplane carried thirty-two passengers. This flight was made under military supervision, but the record was not submitted to the International Aeronautic Federation for homolgation. We have not as yet been advised as to whether the records made recently in England and France, in which forty and thirty-five passengers were carried respectively, were observed by official observers of the Aero Club of the United Kingdom and the Aero Club of France which would be necessary to have the records accepted by the International Aeronautic Federation and the Pan American Aeronautic Federation."

Major L. Falchi of the Italian Aviation Mission

Lieutenant Colonel Henry L. Watson, one of the few junior military aviators in the U. S. Air Service

Flew 550 Miles in 250 Minutes

Washington—C. F. Kettering, Vice President and Chief Engineer of the Dayton-Wright Airplane Company, and Howard M. Rinehart, premier pilot of the same concern, flew 550 miles, from Dayton, Ohio, to New York, November 30 in 4 hours and 10 minutes. December 1, in the same machine, they flew from New York to Washington in 2 hours and 5 minutes. The trip was made in a standard De Haviland-4 army plane, equipped with a twelve-cylinder, 400-horse-power Liberty motor, the same type of machine as that used during the last four months of the war by American airmen attached to General Pershing's expedition.

The men who made the flight called up New York City from Dayton by long-distance telephone at 10 o'clock yesterday morning, made an engagement for dinner, and the theatre that evening, and arrived in time to keep both engagements, landing at the Mineola flying field. A speed of 132 miles an hour was averaged for the trip. When the Mineola field was reached there was enough oil and gasoline left in the tanks to carry the machine back to Dayton. Mr. Rinehart said it was feasible to make a 1,000-mile nonstop trip with that type of aeroplane.

Our Naval Forces Abroad Are Being Rapidly Reduced

Paris.—The American naval establishment in European ports and waters is being reduced rapidly since the armistice. It is intended to order home soon all small craft, destroyers and submarines used principally as convoys, except for a limited number for patrol and escort duty.

The American naval base at Brest, however, will not be abandoned but will be used as a repair station. The general installations there will be enlarged somewhat in order to take care of the steady stream of transports which will carry the American troops back.

Other bases along the coast, including balloon and aeroplane sheds and branch repair plants, no longer are required, and a considerable part of the naval personnel already has started homeward.

Thaw Now Lieut.-Colonel

Major William Thaw, American "ace," with the 103d United States Aero Squadron in France, has been promoted to a lieutenant-colonelcy, according to advices received here to-day by Alan R. Hawley, president of the Aero Club of America.

Lieut.-Col. Thaw is 28 years old, one of the youngest officers of that rank in the American or Allied armies. He received recently the United States Distinguished Service Cross with two citations by Gen. Pershing and had previously been similarly honored by the French Government.

Lieut. Miller Makes Flight from Dayton to Pittsburgh

Pittsburgh.—Lieutenant Charles Miller, of the United States Army Aviation Corps, test pilot at Wright Field, Dayton, Ohio, landed in Schenley Park, having covered the ninety-one miles between Deninson, O., and Pittsburgh in fifty minutes.

Washington to Schenectady for Thanksgiving Dinner

Schenectady.—To pass Thanksgiving Day with his friend Miss Frances Zeiser, daughter of Mr. and Mrs. Julius Zeiser, of this city, Lieut. Philip W. Lucas flew in an army scout machine from Washington to Schenectady.

Returning Airman Will Go to Mills

Plans have been completed at Camp Mills by Col. C. H. Smith, camp quartermaster, and Col. Moose, of the Mitchel Aviation Field, for the reception of the first detachment of troops from England.

Aerial detachments from England will be the first to arrive. They all probably will be sent to Camp Mills for disinfection of their clothing and then lined up for review and marched to Mitchel Field, which adjoins this camp.

Camp Mills can take care of 10,000 troops in addition to those already there; at Mitchel Field 16,000 can be put in barracks.

It is planned to examine and muster the men out as quickly as possible. From one to two thousand will be mustered out daily and will be sent in detachments to their homes. They probably will be homeward bound within a week after their arrival.

American Airmen Get British D. F. C.

Eleven enemy aeroplanes and one hostile balloon were brought down by American aviators brigaded with the British during the period from September 9 to September 22, inclusive, and five American aviators were awarded the British distinguished flying cross, according to the latest Royal Flying Corps communiques just received here.

Special mention was made as follows:

"Lt. G. A. Vaughn, while on offensive patrol, was engaged by about fifteen enemy aeroplanes, one of which was attacking a flight of our machines, he dived on and shot down in flames. He then attacked another, which he followed down to 2,000 feet. This enemy aeroplane was seen to crash by another pilot."

The distinguished flying cross was awarded to:

Lt. Col. Americo Pio, the famous Italian Ace here with the Italian Mission

Lt. G. A. Vaughn, George A. Vaughn, father, 441 Washington Ave., Brooklyn, N. Y.; Lt. T. J. Herbert, John T. Herbert, father, 1644 East 86th St., Cleveland, Ohio; Lt. M. L. Campbell, Charles L. Campbell, father, Wakeman, Ohio; Lt. L. A. Hamilton, 49 Bartlett Ave., Pittsfield, Mass.; Lt. J. A. Keating, 5748 Peoria St., Chicago, Ill., Mrs. James A. Keating, wife, 2232 West 109th St., Chicago, Ill.

Enemy aeroplanes were brought down by: Lt. H. C. Knotts, Edward C. Knotts, father, Carlinville, Ill.; Lt. H. L. Bair, 111 West 111th St., New York, N. Y.; Lt. W. W. Lauer, (Willard W. Lauer, Mrs. W. J. Lauer, 3422 Park View Ave., Pittsburg, Pa.); Lt. F. E. Luff, H. J. Luff, father, 3046 Lincoln Blvd., Cleveland Heights, O.; Lt. T. L. Moore, 617 Chestnut St., Kewanee, Ill.; Lt. J. O. Creech, 6614 Harlan Place, Takoma Park, Washington, D. C.; Lt. W. Clements, Gloucester, Va.; Lt. F. E. Kindley, Uther Caliahan, cousin, Gravette, Ark.; 2d Lt. H. Burdick, 174 Remsen St., Brooklyn, N. Y.; Lt. E. W. Springs, Leroy Springs, father, Lancaster, Pa.; Lt. G. D. Wicks, Mrs. Lucie C. Wicks, mother, Sanquoit, N. Y.

A hostile balloon was brought down by 2d Lt. A. F. Diamond, Mrs. Emma J. Adams, Baltimore and Rose Sts., Mobile, Ala.

Downs 3 German Planes

Lieut. Gordon V. Moy of the American aviation service has been credited officially with downing three German planes, according to a letter received from him.

Lieut. Moy was reported missing September 26. He showed up later, having been separated from his squadron. He is a graduate of Pennsylvania State College.

Details of Lieut. Ross's Death, First U. S. Balloon Fatality

An official communication received at the Division of Military Aeronautics confirms the death of Lieut. C. J. Ross, of the American Expeditionary Forces Balloon Corps. Eye witnesses of the action in which he was killed, arrived by the same steamship that brought the communication. From them it was learned that the American balloons were in use on a special mission on this occasion, which was a day of overcast skies.

Suddenly during an intense bombardment by the American Artillery, which was being directed by Lieut. Ross, a German air squadron appeared out of a cloud bank, dived for the balloon carrying this efficient observer, and one of the planes reached it, setting it on fire.

Lieut. Ross's companion had some trouble in getting out of the basket, thus involving a delay, and the observer remained to see him safely clear before he jumped himself. His delay proved fatal, since his parachute in its slow flight was overtaken and ignited by burning wreckage from the balloon, and he was killed instantly by the resulting fall.

This is the first death in the American balloon corps since it has been on the lines. From the report it appears that the Germans were willing to sacrifice squadron of planes to stop the devastating artillery fire which hinged on the work of the observer.

One of the new balloon fields that are now being established in the South will be named after Lieut. Ross, the first of the American balloon observers to die in action. Lieut. Ross was appointed from Pennsylvania. He graduated from the Officers' Training School at Fort Niagara, was transferred to the Balloon Corps, and his balloon training was completed at the American Balloon School at Bordeaux, France.

Official Confirmation of Lieut. Campbell's Looping Record

We reported in our last issue the report that Lieut. W. T. Campbell had succeeded in breaking the world's looping record, and we are now glad to publish the official confirmation herewith:

PROCEEDINGS OF A BOARD OF OFFICERS CONVENED AT LOVE FIELD, DALLAS, TEXAS, NOVEMBER 13, 1918

To whom it may concern:

The following officers composed a board to count the number of successive loops made by First Lieut. Wm. T. Campbell, A. S. A., on Tuesday, November 12, 1918. This board finds that Lieut. Campbell has succeeded in breaking the world's record by looping the loop 151 consecutive times.

(Signed) MAURICE A. SHARP,
1st Lieut. Maurice A. Sharpe, A. S. A.
President (Rich Field).

(Signed) DUDLEY B. MAYER,
1st Lieut. Dudley B. Mayer, A. S. A.
Member (Love Field).

(Signed) JOSEPH BORDEN,
2d Lieut. Joseph Borden, A. S. A.
Recorder (Taliaferro Field).

Cadet Fliers Have Choice

All cadet aviators now in training in the United States will be given the option of immediate discharge. Cadets who elect to complete their training will be discharged when they finish the course and given commissions as second lieutenants in the Officers' Reserve Corps.

Candidates for commissions at balloon schools also will be given an opportunity to complete their training, after which they will be commissioned in the Officers' Reserve Corps.

Orders have been issued for the closing of Selfridge Field, Mount Clemens, Mich.; Chanute Field, Rantoul, Ill., and Scott Field, Belleville, Ill., and for the abandonment of the air service mechanics' school at St. Paul, Minn.

The final inspection room of the Renault Motor Co. in France

The Story of Guynemer

Georges Guynemer: born in Paris December 24, 1894, of a historic soldier family, has entered the ranks of the proudest chivalry of earth, the warriors of France. In his youth, his passionate fury of combat, his impetuous nervous vitality, there was an echo of the very pulse of France. His life spoke to the heart of the nation. Honoring him, she honored her own instincts, her own truest ideals. He was her eaglet, her imp of glory.

Henry Bordeaux, in this just published book, "Guynemer, Knight of the Air," obtainable at the Aeronautic Library, Inc., No. 299 Madison Avenue, New York City. Price $1.60.

Aviation School at Princeton Closed

Washington — The Government closed the School of Military Aeronautics at Princeton Nov. 23. Of the flying cadets remaining in the school 110 desired to finish the course and were transferred to the ground school at Austin, Texas. The others were discharged from the service at their own request.

The buildings which have been occupied by the school are to be turned over to the university within a few days. Officers stationed at the school will remain in Princeton for the present, to close up the offices and return the equipment to the Government arsenals.

Princeton was a pioneer in training aviators for the war. Several months before the United States entered the conflict the Princeton Flying School was established as a voluntary effort on the part of the Princeton students and alumni, and the fliers trained in this school were among the first to get overseas after America entered the war.

This early movement led to the establishment of the United States School of Military Aeronautics at Princeton, the university authorities turning over to the Government several buildings for the instruction of aviators. The school was opened July 3, 1917, and soon became one of the best in the country.

The first class was graduated eight weeks after the opening, and a new class started each week, so that aviators were turned out rapidly, a class being graduated each week after the first eight weeks. The course was changed to twelve weeks, after the demand for aviators became less pressing. Since the establishment of the school more than 3,000 aviators completed the course at Princeton. Many of these men won distinction at the front, and a considerable number gave their lives in the service. Several have won citations and decorations.

City College to Continue Aeroplane Classes

The evening classes in aeroplane mechanics which the City College started as a war measure are going to continue without interruption after the return of peace. The only change will be the emphasis on the informational and vocational aspects of the subject, rather than the military point of view.

"We started these classes last summer," says Dr. Frederick B. Robinson, Director of Vocational Courses at the College, "in order to train young men as aircraft mechanics to aid in the construction and in the flying of America's great air fleet. With the passing of war conditions, there still remains a pressing need for courses of this character in order to train men for the engineering and construction departments of aeroplane factories. The aeroplane industry, representing an investment of over two billion dollars, is here to stay. It offers a large future to men who are properly equipped and we are ready to supply this training to all young men who are ambitious in this direction."

The evening courses offered at the College include Aeroplane Mechanics, Advanced Aeroplane Mechanics and Aeroplane Design. In these classes, which are open to any resident of the City, the construction of aeroplanes and engines is studied and laboratory work is given in the operations of assembling, adjustment and repair. With the cooperation of the United States Government, and of many manufacturers of aeronautic equipment, the College has secured for its laboratory a large number of aeroplanes and aeroplane engines which are used by the students for their practice work.

The aviation classes are in charge of Professor D. B. Steinman of the Engineering Department of the College, with a number of assistants who are specialists in the different branches of the work. Over four hundred students have already been graduated from these courses. New classes are opening in December and those who are interested can secure full information by writing or calling at the College any evening this week.

The AIRCRAFT TRADE REVIEW

Invention Board Appointed

Cols. Charles R. Alley and Daniel I. Sultan, general staff, and Maj. Kingsley Twining, air service, have been constituted a board to investigate all questions concerning the development of certain secret appliances with a view to their transference to the proper agency of the War Department for further development of the inventions and the construction and test of full-sized models.

Abandon Two-Stop Flight

Tucson, Ariz.—The two-stop flight of the Loughead biplane from Santa Barbara, Cal., to Washington, D. C., was abandoned November 26 following a fall at Gila Bend, Ariz., in which Pilot O. S. T. Myerhoffer was slightly hurt and his mechanician, Leo F. Flint, was severly injured. The machine was badly damaged. The flight started last Saturday from Santa Barbara.

Parachute Drops Thrill Washington

Washington was thrilled by a performance in the air by two naval aeronauts. While circling high over the heart of the city, they swung their feet over the edges of two naval planes and started downward on ten-minute trips to the capital with twenty-foot-wide parachutes swaying above them.

In private life these parachute artists are Gunner John L. McCoy and Sergt. Thomas A. Holland, members of the balloon detachment of the United States Marine Corps, stationed at Quantico. Both the men had made similar previous leaps, but the performance was a brand-new one to Washington.

The men were announced to try to land on the ellipse as a public surprise just as the head of the "free milk for France" parade was passing that point. Their planes, however, did not appear until after 4:30 o'clock, and neither jumper came within a half mile of the designated spot.

Jamieson in Charge of Equipment Disposition

Washington, Nov. 23—Disposition of all manufacturing materials, equipment and buildings which will now or later become the property of the United States as a result of contract cancellations by the Ordnance Department will be in charge of a board headed by Brig.-Gen. C. C. Jamieson, which will decide their sale or storage.

5,000th Packard-Liberty Shipped

Detroit, Nov. 26—The Packard Motor Car Co. shipped its 5,000th Liberty engine on Nov. 21, practically one year after the first engine of this kind to be produced by the company. It was on Thanksgiving Day, 1917, that actual production was started. Production on the original order for 6,000 will be completed in less than 30 days at the present rate of output.

Substitute for Gasoline Tested by Bureau of Standards

Washington, Nov. 26—The Bureau of Standards has recently completed a series of tests of a substitute for gasoline which is said to be satisfactory in every respect, to cost less than gasoline, to be available in ample quantities and to give more power than gasoline.

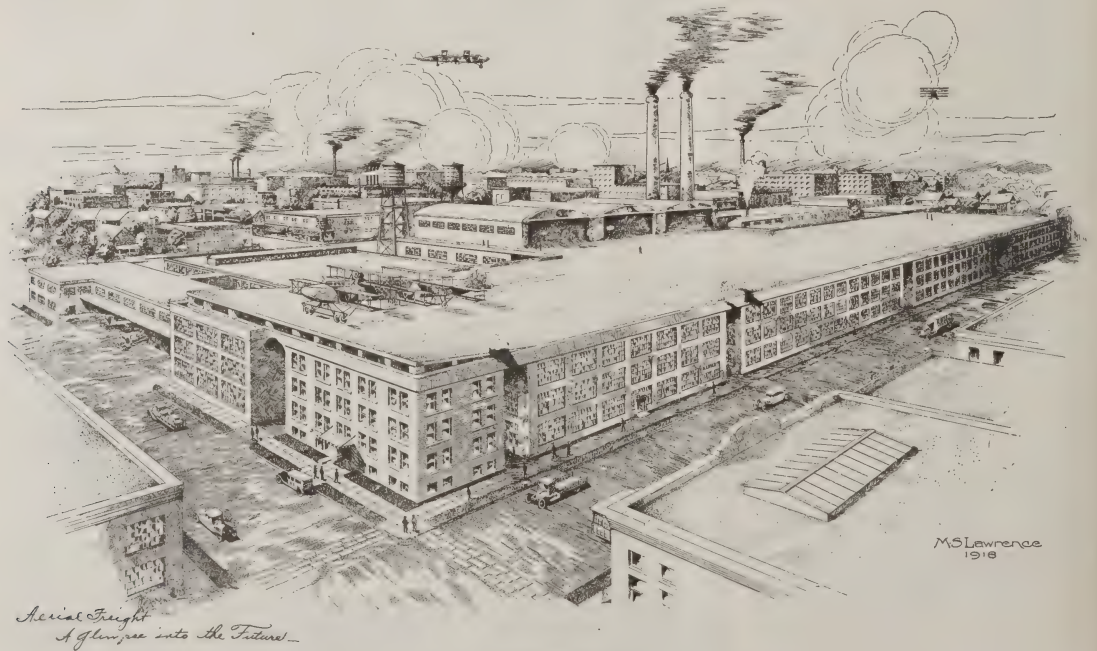
The fuel is the result of experiments of Capt. E. C. Weisgerber, and the formula is a secret. A deal has been completed to commercialize the product and place it on the market.

The substitute is in liquid form manufactured by a still process, composed of commodities which are now a drug on the market and which are plentiful enough to assure supplies to meet the future demands. The formula is a secret in the hands of the General Engineering Depot and the inventor. The cost of manufacture is said to be 40 per cent lower than that of making gasoline.

The substitute, which is known as Liberty fuel, is the direct result of experiments by Capt. E. C. Weisgerber, an oil and gas engineer, who was first connected with the Engineering Corps and has lately been working at the Bureau of Standards. He was ordered to conduct the experiments by his commanding officer for the purpose of securing a fuel other than gasoline and more powerful and economical if possible.

The substitute is described as scentless, tasteless and without gasification scent. It is said that its products of combustion are cooler than gasoline. It is reported to be non-corrosive. It does not give out soot or carbon, according to the reports, and starts easier than gasoline.

The quality and specific gravity are changeable at will, it is stated, and the substitute shows no ill effect on the lubricating oil. It will ignite only from spark or flame. No special apparatus is required either in the engine or carbureter or in the manufacture of the fuel.



Tests were held at the Naval Air Station and at Anacostia Flying Field, D. C., in comparison with special "X" quality of gasoline in which the water used with the Liberty fuel remained below 160 deg. Fahr. and the oil below 130 deg. Fahr.

In the tests by Army officers, mainly conducted by Captain Weisgerber, the new fuel was used in a passenger car, motorcycle, aeroplane, tractor and truck in comparison with gasoline. In the tests by the Bureau of Standards at the laboratories it was used in a Class B truck engine and a 150 h.p. Hispano-Suiza aeroplane engine in comparison with gasoline.

Used on a passenger car the fuel drove the car 17½ miles to the gallon as against 9 m.p.g. on gasoline, and increased the speed from 47 m.p.h. to 69 m.p.h.

Nash On Job Again at Kenosha Plant

With satisfaction over a duty well done but with unbounded enthusiasm over his return to the active participation in his own enterprise and with unlimited optimism over the immediate future of the motor car and aeronautic industries, President C. W. Nash of the Nash Motors Company returned to Kenosha last week and announced the relinquishment of his Government position as chief in charge of production and engineering in the reorganized aircraft department of the Government under Assistant Secretary of War Ryan. Four months ago, at the urgent request of Mr. Ryan, Mr. Nash took over the active management of production and engineering in the aircraft division of the Government war work, and those on the inside award to Mr. Nash's great ability as a production expert a large share of the credit for the wonderfully rapid improvement in conditions in 'plane production and delivery under the Ryan regime.

New York-Chicago Aero Mail Dec. 15 at Reduced Rate

WITH the inauguration of daily aeroplane mail between New York and Chicago on December 15th, a change has been made in the rate of postage, fixing the rate at 6 cents an ounce or fraction thereof instead of 16 cents for the first ounce and 6 cents for each succeeding ounce. This applies to sealed parcels, not exceeding 30 inches in length and girth combined, as well as to letters. The old rate of 16 cents on the first ounce allowed 10 cents for special delivery service. Under the new rate it is left optional to the sender of a letter whether he desires to place a special delivery stamp on his aeroplane mail. This places the aeroplane rate on the same basis as all other letter mail.

On the New York-Chicago route all mail stops are made in ample time to catch the regular carrier delivery, insuring the delivery of the letter that day and making it unnecessary to apply special delivery unless the sender desires immediate expedition of the letter upon its arrival in the city of address. Faster machines, beginning December 15th, will also be placed on the New York-Washington route, insuring arrival of the mail for the regular carrier delivery in Washington and New York on the day of arrival.

Special aeroplane postage stamps or ordinary postage stamps may be used. When ordinary postage stamps are used the mail should be endorsed "By Aeroplane." If special delivery service is desired a special delivery stamp or its equivalent in ordinary postage stamps must be placed on the mail in addition to the 6 cents air postage. If ordinary postage stamps are used in place of the special delivery stamp the mail should be endorsed "Special Delivery."

Aero Mail Sets New Cost Figures

The cost figures just announced for September by the United States Post Office Department, shows that a new cost record was made for the month by a Standard Mailplane No. 1, manufactured by the Standard Aircraft Corporation of Elizabeth, New Jersey, which carried the mail 3,243 miles during the month at a cost of 35¾c. per mile.

This figure includes every expense, such as gasoline, oil, salaries, rent, repairs, officer- overhead, interest on investigation, etc.

The average cost of the mail service per mile during September was slightly in excess of 63 cents per mile.

The Standard Mailplane No. 1, which set the new cost record, had the added distinction of traveling almost twice as far during the month as any of the other planes.

Aero Mail in Snowstorm

The Aero Mail between Washington and New York got its first touch of winter flying on November 4, when Ed. Gardner left New York in a cold rain and flew for 40 minutes through a snowstorm at an altitude of 7,000 feet. The snow was so dense that he could not see the ends of the wings of the machine. He suffered no inconvenience save the chill.

The Aero Mail Service has made all preparations to combat the elements for winter flying. Electrically heated clothing has been ordered and individual heating plants for each plane have been installed. These plants keep the motor warm in the hangars over night through the coldest weather and will enable an immediate start regardless of the degree of cold. Arrangements have also been completed to keep a well packed landing and taking-off area in the snow, and equipment has been devised for control of the plane on sleet and ice on the ground.

On the New York-Chicago route, construction has begun on a $15,000 hangar at Chicago, donated by the business men of that city, and hangars are already in course of construction at Cleveland and Bryan, Ohio. Work on the hangars at Clarion, Bellefonte and Lehighton, Pa., will be begun next week. All the aeroplanes on the New York-Chicago route will be equipped with wireless and everything that can be done to insure a perfect daily service between the cities on the air mail, regardless of weather conditions, has been provided for.

Aero Mail Developments in Great Britain

It is interesting to note that two companies have been formed in London with a view to establishing aerial conveyance lines between various places. The nominal nature of the capital leads one to believe that the companies were formed chiefly to acquire their names.

The Anglo-American Aerial Services, Ltd., is formed to establish, maintain, and work lines of aerial conveyance between Britain, America, Canada, and Central and South America, and between the continents of North and South America, and the various States and Provinces thereof and other places, and to carry on the business of manufacturers of and dealers in aircraft, hangar and aerodrome proprietors, tourist agents, contractors, etc.

The London and Provincial Aerial Services, Ltd., has been formed with the object denoted by the name.

The subscribers are the same persons in both companies.

OTTO PRAEGER, Second Assistant Postmaster General.

LATERAL STABILITY IN AEROPLANES

By C. LEVICK

THE stability of an aeroplane as built to-day is almost in the hands of the pilot. By governing the controls he alters the aerofoils, rudder and elevators in such a manner as to cause forces to come into play which neutralise those created by the wind and the varying density of the air.

Apart from special machines designed to be automatically stable, such as the Dunne biplane, of the original Fokker monoplane, there are remarkably few devices invented which tend to give stability. One of the best known and most used methods of gaining lateral stability is the practice of setting the aerofoils at an angle—called the dihedral angle—to the horizontal. This angle is as a rule very small, varying from 2° to 5°, but in spite of this has a great effect on the behaviour of the machine. It has stood the test of time well, having been employed constantly since the early days of aviation, when it was one of the distinctive points of both the Antoinette and Blackburn monoplanes.

It is interesting to note the effect of a roll on a machine with wings constructed as explained above, the dihedral angle being ϕ degrees.

Fig. 1 shows how part of the normal reaction of the air on the wings is lost, so that one of the disadvantages of the dihedral angle is that it decreases the efficiency of the aerofoil. This effect, however, is very small, amounting to something less than 1 per cent. for an angle of 3 degrees, and is therefore almost negligible.

Fig. 2 shows a machine having been canted through an angle θ degrees by some force, and indicates the vertical thrusts on the wings. It will be seen that the lower wing has moved through a smaller angle than the higher one in relation to the horizontal plane, and is therefore giving a greater vertical lift.

The trust on the lower wing is $r Cos (\theta - \phi)$ and on the high $r Cos (\theta + \phi)$, or on the left and right respectively, presuming the machine to be moving forward perpendicularly to the plane of the paper.

One of the effects of this unequal lift on the wings is to set up a couple, which tends to bring the planes back to their original position. An analogy is the action of the see-saw, the loaded end of which, having been displaced, is being brought back to a level position by a force which is automatically getting less and less, but is zero only when the board is horizontal.

It is difficult to find the dimensions of the couple that may be relied upon, but the result worked out below is probably a normal example. Viz.:—

Let S = span of each wing in feet.
C = chord of each wing in feet.
A = area of each wing in square feet.

Then A = SC square feet.

If the velocity of the machine is such as to cause a lift of 5 lbs. per square foot and r is the total lift or thrust in lbs. normal to wing surface.

Then $r = 5$ SC lbs.

If S = 18 feet and C = 6 feet.

$r = 5 \times 18 \times 6 = 540$ lbs.

If the dihedral angle $\phi = 3°$.

Then vertical lift for each wing in Fig. 1—

$r = r Cos \phi = 540 \times .9986 = 539$ lbs.

Now in Fig. 2, suppose $\theta = 30°$,

Then vertical lifts for left wing—

$r = r Cos (\theta + \phi)$.
$= 540 \; Cos \; 33° = 540 \times .8387$.
$= 452$ lbs.

And for right wing—

$r = r Cos (\theta - \phi) = r Cos \; 27°$.
$= 540 \times .8910$.
$= 481$ lbs.

Showing a difference of 28 lbs.

From the above results it is an easy matter to find the resultant of these two unequal-like parallel forces, and thus to find the couple. The best method is to draw a diagram, such as Fig. 3, but to a very large scale, and thus measure the distances AC and AB.

Those given, however, were calculated and are more exact, although of no more value than an approximate result found by taking AB equal to 18 ft., owing to the very small variation for small and practical value of θ. The couple is 934 $\times$ .2385 lbs. ft. or 223 lbs. ft. It should be noticed that the total vertical thrust when the machine is not level is less than when in the normal position, and also that in the example given the centre of gravity of the machine was supposed to be at the intersection of the wings, whereas in practice it is rather lower down.

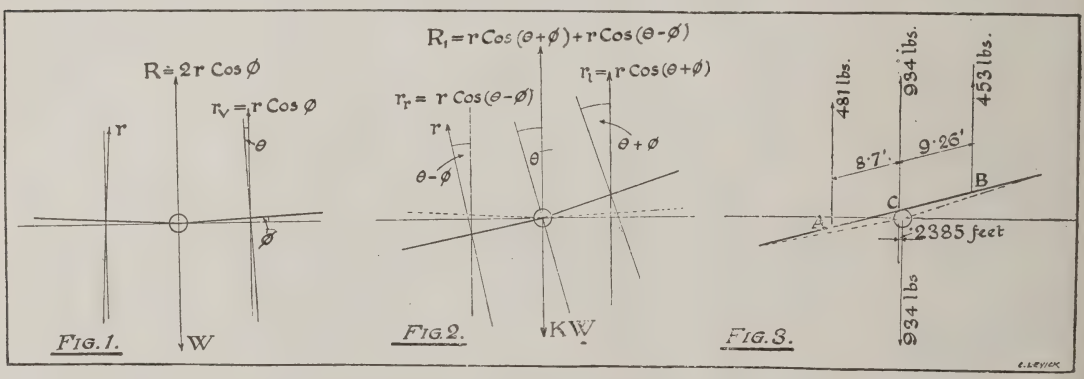

FIG. 1. FIG. 2. FIG. 3.

AERONAUTICAL INVENTIONS

THE National Advisory Committee for Aeronautics, whose duties concerning aeronautical inventions are similar to those of the British Air Inventions Committee, beg to call attention to the following recent public statement made by the latter.

The Air Ministry wishes it to be known that the Air Inventions Committee, which was formed about nine months ago, has now received and examined upwards of 5,000 inventions and suggestions relating to the Air Service.

It is regretted that, owing to war conditions, a detailed account of their investigations cannot be published, but the experience of the Committee indicates that it may be possible to publish certain information which will facilitate the work both of the inventors and of the Committee.

The following statement has been drawn up with this object in view, but it is realized that it is incomplete for the reason just given. It is appreciated also that inventors are placed at great disadvantages in present circumstances, for, unless immediately connected either with the Air Services or with aircraft manufacture it is almost impossible that they should be acquainted with the most recent developments; so rapid has been the recent rate of progress that it is difficult, even for those in close contact with the Royal Air Force, to keep abreast of all the latest improvements. Again, it is practically useless for inventors at the present time to submit inventions which would necessarily take a long time to develop, the requirements of war and the conditions of labor and material making it impossible for the Committee to support proposals of this nature.

Generally speaking, and as far as the period of the war is concerned, no very startling change in the present type of aircraft is anticipated, although improvements in parts and also in details are always possible and may produce very important results.

The stage of development in construction which has now been reached is such that major improvements can only be expected from those possessing the requisite scientific and mechanical knowledge, skill and experience. Thus, radical changes in the shape of the wings of aeroplane, the body, and the propellers are only possible after long and patient research carried out in aeronautical laboratories.

Again, many inventors have forwarded proposals for helicopters and aircraft of this nature which, if an efficient design can be produced, would possess certain advantages, (but probably not so great as was once imagined); others have suggested flapping wings and rotatory planes. Such schemes do not give any promise of being developed for use during this war, and in any case would require some years of experiment before they could be regarded as practical proposals.

As regards minor improvements, inventors should bear in mind that many details, such as turnbuckles, clips, etc., are now standardized, and a change would only be justified by some very marked superiority.

Safety devices for preventing crashing of the

machine and the pilot form a numerous class. The chief of these is the parachute, either applied by a harness to the pilot or directly attached to the machine. Those who have seen a passenger dropped by a parachute from an aeroplane for exhibition purposes often fail to realize the conditions under which a parachute may have to be used as a safety appliance. Then the machine may be out of control, dropping at a velocity of 150 to 200 miles per hour, or spinning downwards in flames. Many other safety devices, such as automatic stabilizers, wind brakes, etc., have been proposed at various times. The additional weight entailed by the use of any of the suggested safety appliances must remain a very serious factor for so long as war conditions prevail.

The engine is the heart of the aeroplane, and on its reliability depends the safety of the pilot. Persons acquainted only with motor car engine practice sometimes do not realize the exacting conditions under which an aeroplane engine must work. The engine must be capable of running for the whole of the time of flight at its maximum power. The lubrication and ignition must be perfect, and the engine must not become overheated.

The rating applied to aeroplane engines is its weight per horsepower, and engines are now being produced which show surprising results in this respect. Inventions which differ radically from present day practice (such as the internal combustion turbine) have small possibilities of being adopted, for successive design and reconstruction entailing probably several years' work are necessary before satisfactory results can be hoped for. In view of the shortages of materials and labor at the present time no new type can be embarked on unless it is demonstrably superior to existing types and possessed of definite and immediate advantages over them.

A subject which is intimately connected with the power plant is its noise. This constitutes one of the disadvantages of an aeroplane. For night flying a method by which it would be possible to hear from one aeroplane, the approach of another, would be of great advantage. The engine can be silenced without serious disadvantages, but the noise of the propeller and the hum of the wires are so great that silencing the engine is not sufficient.

Many proposals for the projection of bombs and grenades of flame and of poisonous gases have been received.

The trailing bomb or grapnel for attacking enemy aircraft and submarines is a favorite suggestion from inventors. This device was tested before the war and at various times since, but has been abandoned in favor of more effective methods.

Instruments

Many hundred of inventions and suggestions for inclinometers and instruments for straight flying and accurate bomb-dropping have been investigated. Efficient and well designed instruments for these purposes have been available for some time past, but it is quite possible that improved forms may be produced, though it is scarcely likely that this can be done by anyone who does not possess the necessary scientific and mechanical knowledge required for an investigation of this nature.

Some inventors entirely disregard the action of centrifugal force upon pendulum and spirit level devices.

A large number of gyroscopic instruments have been proposed which show insufficient knowledge of the correct application and limitations of a gyroscope.

Anti-aircraft devices of various kinds are constantly suggested, but now contain very little new matter for consideration, as such proposals have received the careful attention of the authorities for a long time past and have been the subject of much trial and experiment.

Any proposals of a practical nature which contain features of novelty and may be of utility are discussed with the assistance of the Air Service.

The Committee fully appreciate the genuinely patriotic motives which inspire most of the communications which they have received, and it is with the object of encouraging the submission of useful and well-considered proposals that this statement is issued. Inventors should, however, bear in mind that the somewhat obvious proposals which might have been useful in an earlier stage of the war, are now no longer serviceable.

By following the general tenor of the above suggestions, inventors will greatly assist the Committee in the execution of their responsible duties.

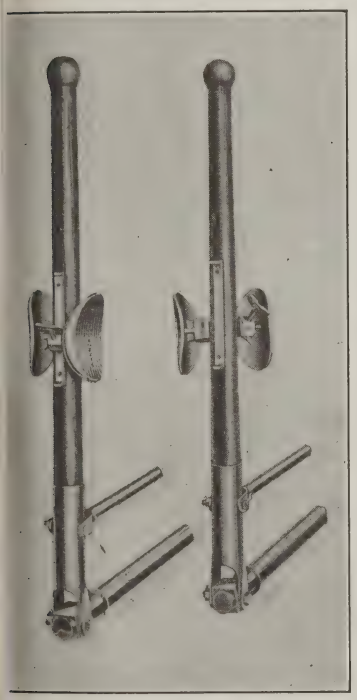
The Status of the Industry When Peace Came

At the time the armistice was signed contracts had been signed for the manufacture of 95,993 aeroplane motors, of which number 31,814 had been actually manufactured. Of this number 15,131 were Liberty motors. In October 5,603 motors were turned out with a contemplated production of 8,000 in January, 1919, and 10,000 a month for the following four months. In addition to this, 12,000 aeroplanes and 700 kite balloons were manufactured.

These figures and others as interesting in connection with the production of aircraft were made public at an exhibition of aeroplane material held in the State, War and Navy building, Washington, on November 28, before Secretary of War Baker and a gathering of newspaper men.

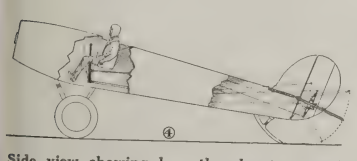
A DeHaviland Four bombing plane was used as a model to illustrate the strides made in aeronautics. Officials who spoke to the gathering declared that the machine shown was typical of more than five hundred which were awaiting shipment overseas when the armistice was signed. The statement was also made that 38,000 of the type of Marlin machine gun mounted on the DeHaviland had been produced in the past twelve months in addition to 30,000 of the Lewis type.

The names of the concerns engaged in the manufacture of Liberty engines and the number produced by each were announced. The Packard Motor Car Co. made 6,000; the Lincoln Motors Company, 6,000; Ford Motor Company, 5,000; Nordyke and Marman, 3,000; General Motors Corporation, Buick and Cadillac companies, 2,000 each; and the Trego Motors Corporation, 500.



On the subject of spruce and linen some interesting statements were made. It was said that to the United States fell the task of supplying the spruce for the aeronautical programme of the Allies as well as its own. In October of last year 5,000,000 feet a month was demanded while the maximum production only totaled 2,500,000 feet. In the same months of this year the requirements were 20,000,000 feet a month, which was met with a production of 25,000,000. To procure this amount of spruce 30,000 men were employed in the Northwest. To supply sufficient quantity cotton fabric as a substitute for Irish linen, 2,500 looms were manufacturing 1,200,000 yards a month when the armstice was signed. Up to that date more than 13,000,000 yards of fabric had been delivered to the government.

The Warner Duplex Stick Control



As will be readily seen by those familiar with the stick control, the "Warner Duplex" differs in that both hand and knee grips are provided for the use of the pilot.

When the pilot requires the use of his hands in case of an emergency that might arise, or for operating a machine-gun, or other device, the knee grip at once comes into use. Using the knees, the pilot has full aileron control and all the elevator control necessary for straight flying. It will be seen that the knee control also acts as an effective elevator lock, as the knee plates are formed with vertical corrugations which prevent slippage.

The knee element is so formed that it allows full sweep to the stick when hand operated.

The Warner duplex stick control showing the adjustable knee plates

Side view showing how the elevator can be held in any position by holding the stick between the knees

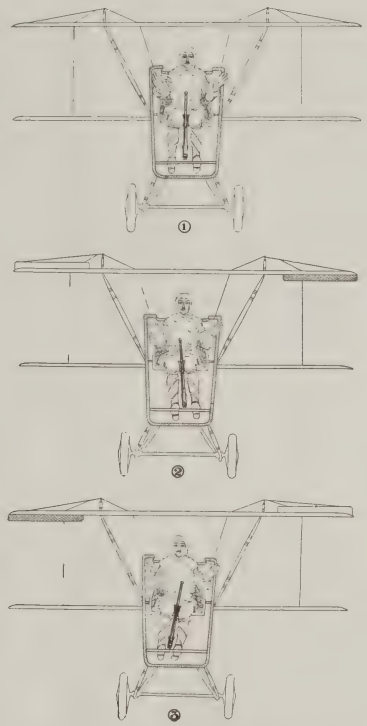


Figure 1.—Stick in neutral position. Figure 2.—Stick moved to the right. Figure 3.—Stick moved to left

The knee grip is made of aluminum and is adjustable to suit the pilot. Adjustment is made on the ground while warning up the engine, after which no further attention is necessary.

Captain R. W. Schroeder, holder of the World's altitude record of 28,900 feet, was one of the first government officers to demonstrate the value of the knee control in a flight from Dayton, Ohio, to Rantoul, Ill., 250 miles, in a training plane so equipped. During this flight he made sketches and notes, having the free use of both hands but at the same time firm hold of the stick by means of the knee-grip feature.

The value of this control for cross-country flying is brought out very forcefully by reports from many of the government aviation fields where it is in use.

In the Aerial Mail Service between New York and Washington, the Warner control has been in use for some months and as an unusual instance of its possibilities, U S. Aerial Mail Pilot Robert Shank reports that he eats his lunch while in flight between New York and Philadelphia as a regular matter of course. Such feats are made possible only by the employment of the knee-grip control.

OUTLINE OF HISTORY OF AVIATION ENGINE PRODUCTION

By Lieut. H. H. EMMONS, U. S. N., R. F., A. S. A. P.

Chief of the Engine Production Department

General Engine Situation

I.

At about the time of the declaration of war, Mr. Coffin, and soon thereafter, Mr. Deeds, were called upon to organize the production of aviation equipment. Naturally, the first point to be determined was what was to be produced. Limited to the engines, it became clear that three courses were open to them:

1. To send a commission of experts abroad to study the engines used by the Allies.
2. To encourage the production in this country of such suitable foreign engines as had already been put in production in the United States.
3. To develop a suitable engine from the talent and facilities available in this country in automobile and allied industries.

Action was taken along each of these three lines.

A commission, comprising Major Howard C. Marmon, Lieut. Col. V. E. Clark and others, was sent abroad and made extensive investigation. The result of this appeared to be that the two best high powered foreign engines were the Rolls Royce and Loraine Dietrich. The Rolls Royce does not adapt itself to American methods of manufacture and the Loraine Dietrich was not at that time completely demonstrated or accepted.

In the United States the General Vehicle Company was attempting, in a very small way for the Allies, to produce the Gnome 100 horsepower rotary engine. Production, however, had not yet started, and facilities and talent for the production of a rotary engine did not exist in this country.

The Wright-Martin Aircraft Corporation was beginning, in a small way, the production of Hispano-Suiza 150 horsepower engines for the Allies. Production had not yet started and the power of this engine was so small that it was apparent that it would soon be obsolete for for fighting purposes.

Both companies, however, were assured of business from the United States Government as soon as they had finished their foreign contracts.

It was clearly apparent that the speediest and most satisfactory method of handling the engine situation would be to develop a distinctive American engine which would adapt itself to American methods of manufacture. Numerous experimental engines had been made by various companies, none of which were adapted to war requirements.

The Hall-Scott Company at Berkley, California, had for several years been manufacturing aviation equipment for use by foreign governments, chiefly in the Orient, and Mr. E. J. Hall, of that company, had traveled in Europe at about the beginning of the war and had inspected the engines made both by the Allies and the Germans.

The Packard Motor Car Company had, for approximately two years, been working on the development of an aviation engine of the 200 horsepower class. This engine had not been flown in a plane but had been successfully used in racing cars. It was, however, too heavy for war purposes, but represented the furtherest advance in this country toward the development of an aviation engine. Mr. J. G. Vincent, chief of the engineering forces of the Packard Company, had, by reason of this development and of his study of the subject, acquired a large understanding of aviation engines.

Mr. Deeds, therefore, called Vincent and Hall into conference in Washington in May, 1917, and on May 29th these two men started the design of an American aviation engine to develop approximately 200 horsepower with 8 cylinders and 300 horsepower with 12 cylinders. They organized a large force of draftsmen and as rapidly as they completed drawings, they were hurried to the Packard Motor Car Company in Detroit, and in its tool room corresponding parts were made. This work was expedited so rapidly that on July 4th, 1917, a complete 8 cylinder engine was delivered in Washington. It was set up at the Bureau of Standards and ran successfully. The development of the engine was pushed rapidly, both at the Bureau of Standards and at the Packard Motor Car Company in Detroit, and the development work on 8 and 12 cylinder engines was hurried forward by a large corps of expert engineers and mechanics.

II.

In August, 1917, the production of aviation equipment was constituted in the Equipment Division of the Signal Corps, and the Engine Production Department was created as a portion of that Division. On that date the writer was put in charge of the Engine Production Department and the real work of producing engines was begun. Engines required fell naturally into three classes:

1. Elementary training,
2. Advance training,
3. Combat.

Elementary Training Engines

As to the elementary training, there were available the following engines:

Curtiss OX, of approximately 90 horsepower,

A-7-A, 4 cylinder engines of approximately 100 horsepower,

Hall-Scott.

Orders were consummated for the production of these engines as promptly as possible.

Advanced Training Engines.—For advanced training, there were available the Gnome 110 horsepower, the LeRhone 80 horsepower, and the Hispano-Suiza 150 horsepower. The General Vehicle Company proceeded with the production of the 110 horsepower Gnome.

The Union Switch & Signal Company have been persuaded to take the contract for the production of the 2,500 LeRhone engines, 80 horsepower type. Their contract has been continued and the Union Swith & Signal Company have delivered up to this date approximately 1,200 of these engines. We have had the assistance of Georges Guillot, the engineer of the French Gnome and LeRhone factories, who pronounces the engine built for the Union Switch & Signal Company to be the best rotary engine ever constructed.

We arranged with the Wright-Martin Company to increase their facilities for the production of the 150 horsepower Hispano type, and their work had such good results that in May, 1918, that company delivered 530 of these engines in one month.

Combat Engines.—As to combat engines, it was clear that the only one available for our manufacturing purposes would be the Liberty, and the test made of it in the months of July and August showed that it functioned properly, and was a satisfactory engine. We therefore started production of it. It was estimated that we would require 22,500 of these engines to take care of the requirements of our Navy and Army. We therefore made contracts as follows:

Packard Motor Car Company—6,000
Lincoln Motors Company—6,000
Ford Motor Company—5,000
Nordyke & Marmon—3,000
General Motors Corporation—Buick—Cadillac—2,000
Trego Motors Corporation—500

The first of these contracts were signed in August, 1917, and production work started immediately.

Difficulties attending production in general grouped themselves as follows:

(a) Machinery—None of the existing motor plants had machinery of sufficient size to handle the parts of the Liberty engines.

(b) Small tools, fixtures and equipment—To produce every part of the Liberty engine requires between 2,500 and 3,000 of such small tools, jigs and fixtures.

(c) Labor—It was soon found that men who were able to make the comparatively simple automobile motors, did not have the skill required to machine parts of Liberty engines.

(d) Unfriendly influence—Some of them were the result of pro-German influence.

(e) Governmental activities—Every Department of the Government was anxious to secure for its special work a large number of tool makers and skilled mechanics.

(f) The Draft—This took a great many men out of this employment.

(g) Materials—The materials required for the engines were of a much higher grade than corresponding material in automobile motors, and work was required to secure proper production of materials.

(h) Transportation and Coal—During the Winter of 1917-

18 the difficulties of transportation and of securing fuel were at times almost insurmountable.

III.

Development of Liberty 12

The Liberty 12 cylinder engine as originally designed was of the 300 horse power class, producing approximately 330 horse power. All the parts of the engine were designed to stand the stresses incident to this horse power. An Aviation Engine is required to have the lightest possible weight with the maximum of power developed; therefore, each part is strained almost to its limit.

When we had succeeded in getting tools and equipment to build this 330 horse power type and had produced approximately 300 of them, we were advised by authorities in France that higher horse power would be required. By readjustment of the parts the engineers stepped up the horse power of this engine to 375, with the result that certain of the parts would not stand this strain, notably the crankshaft, and it was necessary to stop productive efforts and increase these parts to stand this additional power requirement. After several weeks' work this was accomplished and when we had produced approximately 500 of this type we were again notified that an increase in power would be required and that what would be needed for the Summer of 1918 would be 400 horse power or over. We, therefore, again delayed production while the engineers re-arranged the engine parts so that the engine would develop approximately 440 horse power. The resulting strain placed on all the parts of the engine was too great. We were obliged to enlarge and strengthen crankshafts, connecting rods, bearings, etc., etc. together with all the adjacent parts. It became necessary to change the metallurgical specifications, which resulted in changes in the methods of the steel mills. In increasing the size of the parts all of the jigs, tools and fixtures in the machine building plants, the parts factories, forging shops, etc., were rendered obsolete and we had to construct new equipment to meet all these conditions, in order to meet the requirements as given to us by our Aviation authorities in France.

The extent and magnitude of these changes so required is illustrated by the fact that the engine, when competent to develop 330 horse power weighed 765 pounds without water or oil, while, when it was competent to develop 440 horse power, it weighed 860 pounds.

In spite of this difficulty, on May 29, 1918, one year after the first scratch of the pencil toward the design of the engine was made, we had produced and delivered into Service 1,100 Liberty 12 cylinder engines. This is an accomplishment which has not been equalled heretofore in this or any similar industry, either in this country or elsewhere.

IV.

Much agitation had centered about the assertion that thousands of changes were made in this engine. This agitation is entirely incorrect and unfounded. The changes arranged themselves in three groups:

(a) Design
(b) Increase of power
(c) Manufacturing limits

(a) As to design—there have been but two changes in the design in this engine since it was first laid out in May, 1917. One of these was to change the oil system from the so-called scupper feed to forced feed. Either system worked properly on the engine, but the latter system is fool-proof while the former is not. We, therefore, substituted the latter system. The other design change was an alteration in one part of the connecting rod to alllow the rod to have sufficient play without cracking.

(b) The changes due to increasing the horse power twice are covered by the foregoing subdivision. These were the results solely of the demands of our Aviation authorities that the power be increased.

(c) In manufacturing—As the engine was used in Service and as the manufacturing progressed, it became evident that some of these limits should be changed and this action has been followed. This is the common practice in all manufacturing establishments. It has always been so on automobile motors and will always be so on any manufactured product. As new manufacturing processes are developed and as experience is gained manufacturing changes are always expected and are always made.

Therefore, the agitation about changes in the engines, when examined and understood, is unfounded.

V.

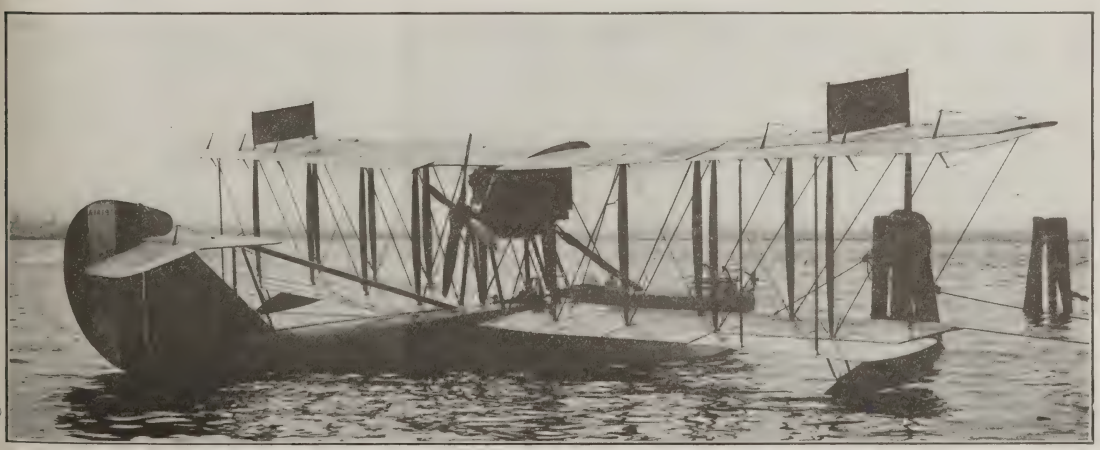
The writer procured an order from the head of the Equipment Division looking up the development of this engine in the Detroit District in charge of Major Heaslet, formerly Vice-President of the Studebaker Corporation; Major Hall and a committee of manufacturers composed of:

H. M. Leland, of the Lincoln Motors Company,
C. Harold Wills, of the Ford Motor Company, and
Messrs. Bell and Roberts, of the Packard Motor Car Company.

No abler men on engines and motors exist in the industry and it was clear that by devoting their entire time solely to this engine and by avoiding interferences with their efforts, we were adopting the very best possible method of securing quick and reliable results. Resulting production, which will be hereinafter detailed, demonstrates that this course of action was the proper one to be followed.

VI.

The same method of concentrating authority was applied to other engines, including:



Hispano-Suiza	150 H.P.
Hispano-Suiza	180 H.P.
Hispano-Suiza	300 H.P.
LeRhone	80 H.P.

VII.

Productive Results.—During July, 1917, the Signal Corps had purchased a miscellaneous assortment of small engines which could be secured in this country, none of which proved of any substantial benefit.

Real production began in August, 1917. The following table shows the total production of engines by months from that date to the present time:

1917—July	66
Aug.	139
Sept.	190
Oct.	276

The Model H. S. 2 L. Flying Boat, constructed by the Standard Aircraft Corporation

	Nov.	638
	Dec.	595
1918—	Jan.	705
	Feb.	1,004
	March	1,686
	April	2,214
	May	2,517
	June	2,604
	July	3,151
	Aug.	3,625
	Sept.	3,801
	Oct.	5,297
	Nov.	3,305
	Total	31,813

VIII.

The production of engines as to types is as follows:

OX-5	8,412
Hispano-Suiza	4,101
LeRhone	1,178
Lawrence	451
Gnome	280
A-7-A	2,250
Bugatti	11
Liberty	15,131
Total	31,814

The total amount of horsepower produced up to November 22, 1918, is as follows:

OX-5	757,080
A-7-A	225,000
LeRhone	94,240
Hispano-Suiza 150	532,350
Hispano-Suiza 180	97,920
Hispano-Suiza 300	2,400
Liberty	6,052,400
Bugatti	4,400
Lawrence	10,824
Gnome	30,800
Total	7,807,414 H.P.

The results achieved by the Liberty Engine were so satisfactory to the Allies that commencing in June, 1918, they were very insistent in placing with us large orders for engines. It has become apparent that we would need additional sources of engine supply over and above the 22,500 which was originally planned for our own Army and Navy. We, therefore, increased the number of manufacturers by adding the three plants of the Willys-Overland Company at Elmira, Elyria and Toledo, and also the Olds Motor Company at Lansing, Mich., to the list of Liberty Producers. We also placed orders for 8,000 8-cylinder Liberty engines with Willys-Overland and the Buick Motor Company at Flint, Mich. When this was completed we had placed orders for engines as follows:

IX.

OX-5	9,450
A-7-A	2,250
Gnome	342
LeRhone	3,900
Lawrence	451
Hispano-Suiza 150	4,000
Hispano-Suiza 180	4,500
Hispano-Suiza 300	10,000
Bugatti	2,000
Liberty 12	51,100
Liberty 8	8,000
Total	95,993

Our production of engines of all types during October was 5,603, of which 3,878 were Liberty 12-cylinder. Under the above increased contracts we would have produced during January, 1919, 8,000 engines per month, which would have increased during the succeeding four months to a production of 10,000 engines per month.

X.

The best-known engine which is comparable to the Liberty is the Rolls-Royce, which is the most prominent English engine. Our advice last summer from the English authorities was that the largest weekly production of Rolls-Royce engines had been 59, and that the average weekly production was 45 engines. It will be noted that during the month of October we were producing over 150 Liberty 12-cylinder engines per working day.

The Rolls-Royce engine develops approximately 100 horsepower less than the Liberty and weighs approximately 100 horsepower more than the Liberty.

Major Booth, who flew from Selfridge Field to Mineola

During the month of October we produced of all types of engines a total of 5,603. This is more than the total production of France and England during one month during the four years of the war.

XI.

By following the foregoing method of production, we have achieved the following results:

1. Designed, developed and put into production during one year a 400-horsepower type of perfectly satisfactory performances.
2. Designed, developed and produced within 18 months over 15,000 of these engines.
3. Produced during 18 months engines of all types totalling 31,814.

XII.

No production of a foreign type of engine would have produced any corresponding result. The difficulties, troubles and delays would have at least equaled those experienced on the Liberty, and the result would have been much less satisfactory.

That the result has been satisfactory is apparent from the entire course of aviation during the past few months, which is illustrated by the three following incidents:

1. The English aviation authorities cabled in June, 1918, that the Liberty engine test had shown it to be a satisfactory aviation engine, and that it was America's greatest contribution to the aviation activities of the war.

2. Count Poiniatowski, who is the official representative in this country of the Hispano-Suiza Company, stated that Mr. Birkight, who is one of the leading French aviation engineers, after examining the first three Liberty engines sent by us to France, stated that they excelled any engine of that type or size which had been developed in France.

3. The experience of the aviators on the front and their opinion of the Liberty engine as given to us by Major Brett on his return from France, is that it is the most satisfactory engine to operate, that was available to them.

XIII.

The foregoing, except the numerical portions, has been dictated hurriedly and without oportunity for revision and correction. It is believed that all statements contained in it are correct, but slight alterations might be required upon a more careful revision.

Bureau of Aircraft Production Statement Regarding Aircraft Program

The Bureau of Aircraft Production is charged with the design, purchase, production and inspection of all material special to the Air Service.

There have been produced in this country during the period of the present emergency in excess of 12,000 airplanes, 30,000 aviation motors and 700 kite balloons, together with a vast variety and quantity of accessories therefor.

In arranging this exhibit it was evidently impossible to illustrate all of the products involved. The exhibit, therefore, is concentrated on the DeHaviland Four Plane, which is an observation machine of advanced type, and is the American built plane which has been extensively used over the front in France.

The front half of the fuselage shown is one of over 500 machines lying at port awaiting shipment overseas when the armistice was declared; it is a regular stock machine and is in no way especially prepared for this exhibition.

The accessories shown around the room are all parts of the equipment of the same DeHaviland Four Plane. At no time are all of these accessories installed on the plane at the same time, the particular installation depending on the service required. Nevertheless, all of the accessories must be furnished, and the machine must be designed to take each and every one of these accessories when required. Your particular attention is called to the wide variety of technical and manufacturing resources required to complete a fighting airplane.

In the production of airplanes, the limit has always been the possibility of engine production. Consideration of the vast investment in factory and machine tools, and the extremely high character of the workmen required, the reason why this is so is indicated.

It is felt that the second limiting point lies in the accessories, including instruments, armament, bombing equipment, radio equipment, photographic equipment, oxygen apparatus and the special clothing and personal equipment of the aviator.

The actual construction of the airplane is less difficult, as the investment in machinery and tools is much less, and the labor involved relatively less skilled.

The special raw materials for aeroplanes have involved vast industrial operations, examples of which are:

Spruce

It fell to the United States to supply the spruce for the entire air program of the Allies and the United States. In October, 1917, these requirements were 5,000,000 feet per month, with only 2,500,000 feet per month being produced. In October 1918, the requirements were 20,000,000 feet per month with over 25,000,000 feet being produced.

These operations involved 30,000 men in the Northwest. It should be borne in mind that lumber actually usable in the airplanes is a relatively small percentage of even the best logs.

Fabric

Early in the war it was evident that the Irish supply of linen would fail. Cotton fabric for aeroplane use was developed in this country and at the time of the signing of the armistice, about 2,500 looms were producing about 1,200,000 yards per month of aeroplane fabric. There had been delivered up to that date a total of over 13,000,000 yards of aeroplane fabric.

The balloon cloth is of finer weave and 3,200 looms were required to produce about 720,000 yards per month.

Armament

1. The guns on an aeroplane consist of fixed machine gun in front which are aimed by pointing the entire plane and, in case of a two-place machine like the DeHaviland-4, the gunner in the rear has flexible machine guns which he can aim in almost any way.

2. These guns are special, different from other machine guns, and to a large extent require special ammunition. There is almost no part of the entire armament equipment of an aeroplane that is not special.

3. After the declaration of war, the only quickly available arm for the fixed forward gun was the Marlin type. The Browning had not yet been developed, therefore, the Marlin was adopted and has been eminently satisfactory, and, in fact, equals the very best on the front.

4. The synchronizing of the gun, that is to say timing the shots from the engine, so that the shot would fire through the propeller without striking blade of the propeller, is a problem never before solved for the Marlin gun and it was necessary to develop the synchronizing device, which permits firing the shots through a propeller revolving, its speed varying from 600 to 1,650 revolutions per minute.

5. The mounting of the Marlin gun, including provisions for ammunition, discharge of the empty shells and discharge of the disintergrading steel belt, was in itself a complicated problem.

6. For the flexible gun shown on the rear cock-pit of the DeHaviland-4, the Lewis gun, the only machine gun not using a belt, was adopted. This involves re-designing the gun taking United States ammunition, increasing ammunition capacity 47 to 97 rounds per container, is part of the problem as was the flexible mounting which is before you.

7. The gun sights involved special lenses, previously made in Germany. The development of optical glass in this country, is a story by itself.

8. The greatest credit is due to the engineers of the ordnance department of the Savage Arms Corporation and of the Marlin-Rockwell Corporation for the wholehearted way in which they at their own expense as far as the latter two are concerned, conducted experiments night and day to solve these problems.

9. Production question involved to develop from nothing on two types of aircraft machine guns to actual shipments in less than twelve months of about 30,000 Lewis flexible type and 25,000 Marlin fixed type, is worthy of note.

10. The fact that special ammunition is required for aircraft service should be remembered. The special cartridges, including armor-piercing, incendiary bullets and tracer bullets, the latter showing a trail of smoke in the air indicating to the gunner the direction of fire.

Bombs

Much public discussion is heard of bombing from airplanes. The DeHaviland Four Machine shown may be used as a day bomber. The various bombs and bomb dropping devices are shown at the side of the room.

Demolition bombs used to destroy permanent structures are made in sizes varying from 50 pounds to 1,000 pounds.

Fragmentation bombs for use against troops. They are bombs that explode just above the ground and send small fragments in all directions.

Incendiary bombs are made in two forms: one to scatter small burning particles over a large area, the other for a more concentrated flame.

Parachute flares are a form of bomb to light the target in night bombing. They are interesting as they contain a complete parachute which supports a flare to drop slowly

(*Continued on page* 679)

ACTIVITIES AT THE PHILADELPHIA NAVAL AIRCRAFT FACTORY

WE are enabled to present this week an exclusive and unusual group of pictures, illustrating the work being done at the Naval Aircraft Factory at Philadelphia.

The work at this establishment was covered in a recent report from the Office of Naval Operations, which stated in part:

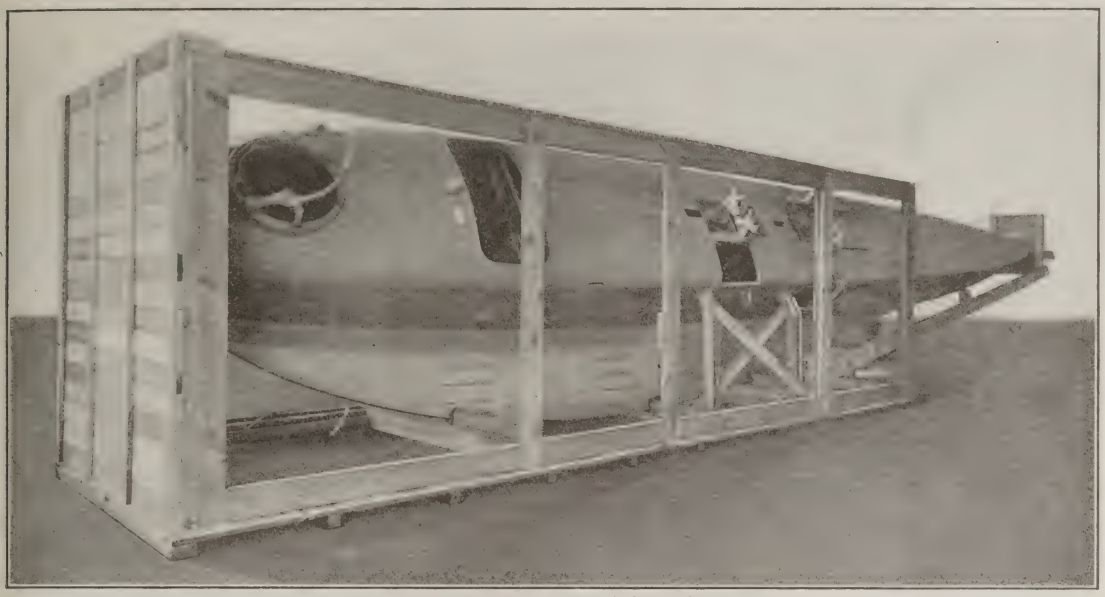
Previous to the declaration of war the Navy had maintained but one air station. This was a small but complete and active station at Pensacola, Fla., which was used for instruction and experimental work. The personnel of aviation at this time consisted of about 30 line officers of the Navy, Marine Corps, and Coast Guard, who were trained as aviators, and 300 men. The aircraft in use consisted of a variety of American and foreign types which had been purchased by the department. Owing to the limited facilities and small appropriations, the results of these activities were not very extensive.

The Naval Reserve Flying Corps, was established by law in 1916, but it was not until February, 1917, that a definite interpretation was placed on this law and that enrollments in the Naval Reserve Flying Corps actually began. The officers who received training in aviation had been regarded as having been detailed for special duty in connection with aviation. The law passed by Congress in 1916, authorizing the Naval Reserve, included not only a reserve to be attached to the fleet but the Naval Reserve Flying Corps. Accordingly when war was declared steps were taken to enroll and train a large number of men for ultimate qualification as pilots. In addition, facilities were provided for the training of a large number of men specialized in the various functions pertaining to aviation, and at the present time schools are in operation for the training of pilots, mechanics, gas-engine experts, communication officers, etc.

On October 2, 1918, the total strength of naval aviation was approximately 40,383 officers and men. Of this number, 16,621 are now abroad and actively engaged in operations against the enemy. This increase in the aviation personnel of the Navy since the beginning of the war has called for an enormous expansion of training facilities. When the training program was first put into operation there was but one ground school. This school provided at that time training facilities for about 300 men. At the present time this number has been increased to 1,200, and, in addition, schools have been established in the Central West and near the Pacific Coast. For the training of airship pilots a school was established in Ohio, and the department is now contemplating the establishment of an additional school.

It was evident to naval authorities that one of the most important ways of assisting the allies was to engage immediately in the anti-submarine warfare. In order to bring the United States to the point where the most good could be accomplished with the facilities immediately available, various methods of combating the submarine were carefully considered. As a result, it was decided to establish coastal patrol stations, both in this country and abroad.

Commander Coburn in charge of the Naval Aircraft Factory at Philadelphia



Construction of stations in the United States was started immediately, and today practically the entire eastern Atlantic coast is being patrolled by naval aircraft, and the Navy Department is prepared to extend these operations along the Gulf and Pacific coasts. In addition to seaplane-patrol stations, airship and kite balloon stations have been put into operation, and, in order to attain the greatest possible efficiency and cruising radius for seaplanes, rest and supply stations are being located in the most advantageous points.

The increase in the number of stations abroad has been fully as great. The month following the declaration of war 5 naval aviators and 100 enlisted men were sent abroad, and these forces were the first forces of the United States to land in France for service against the enemy. The bodies of three of these men are now buried in France, and two others were killed in seaplane accidents. Since the arrival of this first expedition abroad, stations have been established not only in France, but in England, Ireland, and Italy as well. In order to appreciate more fully the magnitude of this achievement, it may be said that it has been necessary to ship from the United States practically all the material for these stations, which includes, hangars, machinery, and, in a word, everything that will eventually be used at these points.

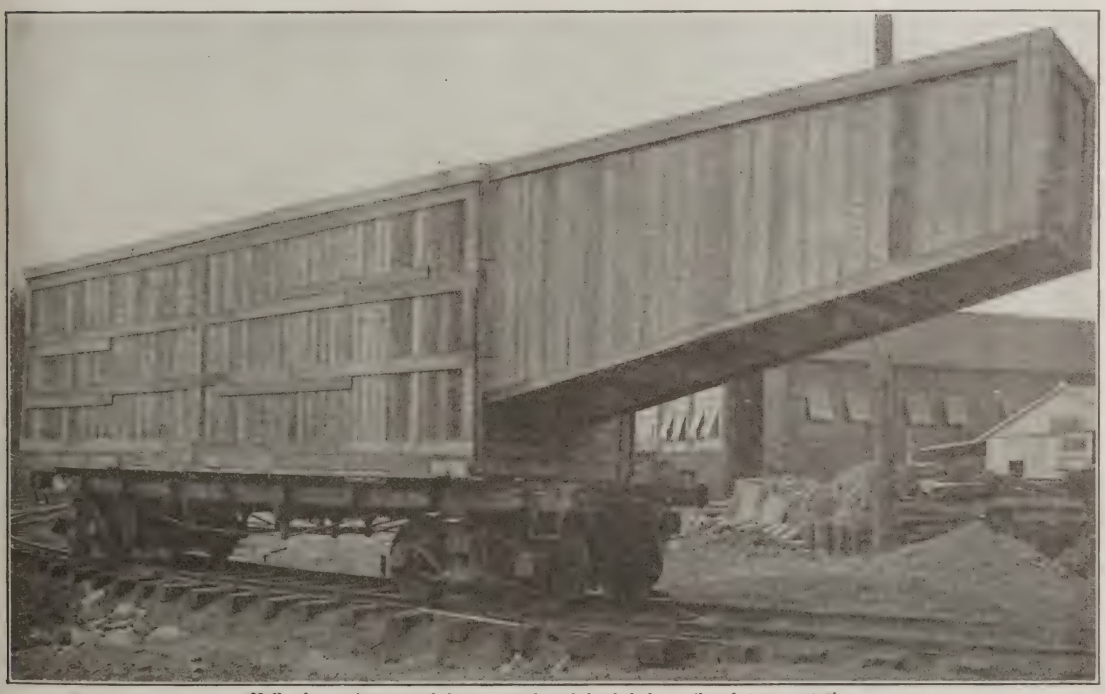
During the month of September, 1918, aircraft engaged in patrol flights in the United States covered a total distance of 404,775 miles. Aircraft engaged in training flights covered a total of 1,317,460 miles during the same period. It is not considered advisable to give out actual figures regarding the operations at foreign stations. The work abroad has gone forward steadily, and the results obtained are becoming more and more important. A recent announcement by the Navy Department to the effect that American naval aircraft successfully attacked and destroyed a German submarine, is only one illustration of the work that is being done over there. The stations, in addition to carrying out active anti-submarine patrols, have been engaged in assisting vessels of

Completing flying boat hulls in one of the sections of the Naval Aircraft factory

Crating a hull for shipment—one of the smaller types

the fleet in convoying troops and merchant ships.

On April 27, 1918, an American airship abroad made a continuous flight for 25 hours and 43 minutes, during the course of which three convoys were escorted for 13 hours and 50 minutes in a zone which was mined and patrolled. In recognition of this accomplishment the French Minister of the Marine officially complimented the American forces, saying that "such an ascension of 25 hours and 43 minutes, which constitutes by its duration a remarkable performance, gives us proof of the most excellent qualities of endurance, of energy, of sangfroid, and of technical ability of the American forces."



In addition to the activities mentioned above, the Navy Department decided to organize an expedition to destroy enemy submarine and naval bases. The personnel and material of this expedition was organized in the United States and later sent abroad. On August 15, 1918, it was announced that operations had been started by bombing and destroying enemy bases in Belgium. The scope of the activities of the expedition have since been increased and the original forces augmented from time to time.

When war was declared on April 6, 1917, 93 heavier-than-air seaplanes had previously been delivered to the Navy and 135 were on order. Of the number that had previously been delivered, only 21 were in use, the remainder having been worn out or lost. The seaplanes were of the N-9 and R-6 types, which are now considered as training seaplanes.

After eliminating types which had been tried and found unsuitable, the department fixed upon two sizes for war purposes which had been perfected in the United States in anticipation of the development of a high-powered engine. The engine developed is the Liberty. The flying boat, which, at the present time, is strongly favored, is an American conception, and it has not been found necessary to copy foreign patterns to insure our flyers being supplied with the best. With this development of the heavier-than-air craft came the development of airships and kite balloons.

With the development of suitable planes and

Through the energies of the Naval Aircraft Factory executives over 400 seaplanes were shipped abroad and 500 were put in Naval Air Service stations in America. The majority of the overseas boats were used off the coast of Ireland

forty twin-motored flying boats being assembled

THE HUGHES AIRCRAFT REPORT

(*Continued from last issue*)

Fifth: Conditions in Manufacturing Plants

The conditions in certain plants engaged in the manufacture of aeroplanes were unfavorable to production, not only because of lack of experience and the absence of mechanics trained in that class of work but because of defective organization and want of efficiency. The Dayton Wright Aeroplane Company had the difficulties inherent in a new organization, but in view of the changes that were required in the course of production it would be impossible to define to what extent, if any, production was retarded by reason of the fact that the organization was a new one. The lack of competent organization at the North Elmwood plant (Buffalo) of the Curtiss Aeroplane and Motor Corporation is commented upon later (*post*, pp. 150, 156), but in view of the cancellation of the Bristol order it need not be considered here. Whatever delay there was, was in the course of an atempt to make an impossible plane. At the plant of the Standard Aircraft Corporation conditions were also far from satisfactory, but for the same reason, so far as service planes are concerned, its capacity for production was not put to a proper test. It should be added that at this plant the first Handley-Page was assembled and successfully flown within ninety days after the company had been given full charge of the matter.

There have not been lacking indications of sinister influences at various plants. The opportunities of workmen at aircraft plants to retard production or to injure material and product are quite obvious and the necessity of keeping the plants free of enemy influences is emphasized in another part of this report. But, so far as the delays in production of service planes are concerned, it is impossible in view of interrupted work and changing plans to attribute the delays in any definite measure to such a cause.

Sixth: Changes in the Liberty Engine

In any proper estimate of what should have been accomplished in carrying out the aircraft program it is necessary that regard should be had to the development of the Liberty motor. The aeroplane must have its motor, and it was inevitable that in the development of a new high-power aeroplane engine, with the object of securing higher power with a lower weight per unit of power, that changes would be found necessary. Needed improvements were constantly suggested by experimentation, and the number of changes looms very large in the testimony of the experienced engineers who were endeavoring to get into quantity production. It is unnecessary to attempt a review of these numerous changes, for whether time could have been saved by greater expertness is a matter of opinion, and in view of the time that has frequently been spent in the development of new types of motors, there is slight ground for criticism by reason of loss of time in perfecting the Liberty motor. The difficulties were inherent in the task and the task itself was worth while. As has been said, there was no reason why the development of the Liberty motors should have stood in the way of the production of other motors, such as the Hispano-Suiza for use in single-seater pursuit planes to which the Liberty engine was not adapted. But, so far as the heavier observation and bombing planes are concerned, the weight of opinion is that it would have taken about as long to put any other high-power motor into successful quantity production in this country, according to our methods of manufacture, as it has taken to develop the Liberty motor. The attempt to secure planes and motors through foreign production for service pending this development has already been reviewed. By pursuing different methods it is possible, as testified by Lt.-Col. Hall, that there might have been a small preliminary production of Liberty motors two or three months earlier, but, making due allowances for the inevitable course of experimentation, the Liberty motor could not have been put into large production much earlier than it was. What has been called the "immaturity" of the Liberty motor placed a time limitation upon the program for the planes that were made to take this motor, but it may be observed that by May 4, 1918, 778 Liberty motors (U.S. 12s) had ben made, of which 390 were taken by the Army, and only 36 DeH-4s had at that time been delivered, and no other Army planes to take this motor were available. It can hardly be said that unnecessary delays in service-plane production, caused by bad organization and lack of a settled design, were excused by unforeseen difficulties in the development of the Liberty engine; and it should also be observed that if, in the light of general experience in motor building, delay in the development of the Liberty engine was to be feared, there was the greater reason for making sure, to the full extent of ability, of the immediate production of single-seater pursuit planes for which other engines could be provided.

Eighth: Contractor's Profits

Under the various fixed-price contracts, it is probable that large profits have been gained, but definite information as to their extent would not be available without a survey in detail of manufacturing conditions and costs in a considerable number of plants,—an undertaking which would have been wholly impracticable in this inquiry. The profits allowed by the cost-plus contracts present a distinct question.

The justification for cost-plus contracts was found in the fact that the undertakings were novel and that the manufacturers did not have accurate data upon which to make a satisfactory estimate of the cost of production. This was conspicuously true in the case of aeroplanes of types with which manufacturers in this country had been unacquainted previously. For production in large quantity either new plants or greatly enlarged facilities at existing plants, as well as special tools, would be required to meet an exigency of uncertain duration, and it would also be necessary to procure the requisite labor and materials for the new undertakings in a rising market and to provide working capital for long periods. And, while motors had been manufactured here upon a large scale, the newly-designed engines for the service aeroplanes required such a reduced weight per horse power and such delicacy of construction that it was felt that the enterprise had many elements of uncertainty. In these circumstances, it was not an unreasonable conclusion that if contracts for the new types of aeroplanes and for the new engine were offered solely on a fixed-price basis, either manufacturers would not undertake the work or would insist upon high prices as a safeguard against the chances of ultimate loss. It was deemed inexpedient for the Government to undertake the manufacture directly, and it was decided to adopt the alternative of an assumption by the Government of the cost of manufacture through contracts upon a cost-plus basis. This practice, however, could not properly outlast the reasons which may have justified it at the outset. Contracts of this sort lead to waste, foster abuses, and impose an almost intolerable burden of cost accounting, in itself a hindrance to rapid production. Early in this inquiry it was abundantly shown that it was highly important to establish reasonable fixed prices whenever experience afforded a fair basis for estimates.

The principal features of the cost-plus contracts for aeroplanes and engines may be said to be these:

(1) The payment by the Government of the contractor's outlays for labor and materials and for the overhead charges incident to the work;

(2) The payment by the Government for special tools and certain 'increased facilities' located in the contractor's plant, but owned by the Government;

(3) Reimbursement by the Governor for depreciation;

(4) A fixed price to the contractor; and

(5) The fixing of an estimated cost, or 'bogey,' and a division of whatever saving was effected under this estimate so as to give 25 per cent. of this saving to the contractor as additional profit.

It will be observed that by this method the contractor is assured not only the payment of the cost of labor and material used in the process of manufacture, but of administrative outlays for management and supervision, and an allowance for depreciation of plant. To the extent that these payments are made promptly and at short intervals, the working capital required would be reduced. Provision has also been made for the supply of needed assistance by means of advances through the War Credits Board where these are deemed to be justified. The contractor is guaranteed a certain profit regardless of cost. This is called the 'fixed profit.' And finally, the fixing of a 'bogey' cost—was designed to counteract the temptation to wastefulness by giving the contractor a substantial share in the fruits of economy. And it may here be noted that, the popular impression that under this form of contract, the contractors receive the same amount of profit, however wasteful they may be, and have no incentive to avoid unnecessary outlays, is without foundation. The bogey costs were in all cases placed so high that the contractor had every reason to expect that the actual cost would be much less and that through its share in this saving the contractor would be able to derive an increased profit from economical management. It is apparent, however, that with a large fixed profit guaranteed the incentive to economy is not as strong as when the entire venture is at the contractor's risk. And particularly when interruption of work and changes in design vex production managers, and it is difficult to maintain economical methods, there may easily be bred an indifference to an excessive cost where its burden falls upon the Government. At least this is to be inferred from conditions in certain plants, and the conclusion is unescapable that the cost-plus system of contracts for the manufacture of commodities, as distinguished from such contracts for mere service, is a vicious system and is to be tolerated only during such period as it is found to be absolutely necessary to secure immediate production.

The fact, however, that a cost-plus system is deemed advisable for a time does not justify an exorbitant fixed profit. It has already been pointed out in the case of the Dayton Wright Aeroplane Company that the contract for DeHaviland-4s originally called for a fixed profit of $875 per plane. This was arrived at on the basis of 12½ per cent. of the bogey cost of $7,000. This, however, was not an actual cost, and, as the event has shown, was very far above the actual cost. If it had been thought fair that there should be a profit of 12½ per cent. per unit produced, it would have been a simple matter to have given this percentage of the actual cost, as the actual cost was to be ascertained in the course of the accounting, and provide for payments from time to time on account. There is no conceivable reason for giving a percentage of the bogey cost, if the object were merely to assure the contractor a profit equivalent to a given percentage of cost. The actual cost of the DeHaviland-4s at the plant of the Dayton Wright Aeroplane Company, despite all the difficulties of production and the enhanced cost of the first lot of machines produced during a period of many changes in design, is understood to be under $4,400. A fixed profit of 12½ per cents on the actual cost of each machine would have been about $550, instead of the $875 which was fixed by making the calculation on the bogey cost.

Again, in a contract for manufacturing articles at the contractor's plant, the agreed profit upon a cost-plus basis should have a proper relation to the contractor's actual investment and risk. The contractor is not only reimbursed for his outlays for labor and material but for expenses of management included in overhead charges,—including such reasonable salaries of officers, managers, etc., as may properly be allocated to the Government work. There is no sacred formula by which the Government is bound to pay a profit per unit of production regardless of the time in which capital is turned over. The extent to which the Government supplies the needed working capital, either by payments on account of work and materials supplied or through advances, should also be considered. A percentage of outlays, or of a bogey cost, although small in itself, may give an exorbitant profit as applied to each unit of a large production.

Service Aeroplane Contracts.

In the case of the Dayton Wright Aeroplane Company the paid in capital was $1,000,000, invested in plant. Advances by the Government to the extent of $2,500,000 were authorized and in December and January last advances of $1,000,000 were actually made. These were followed by additional advances, and the balance of total advances on June 30, 1918, was $1,405,222.57. Approximately $750,000 of the money thus borrowed from the Government at interest is represented by investment in fixed assets. The plant is exclusively devoted to Government work and outlays for labor, materials and overhead, as provided in the contract, are met by the Government.

The operations of this Company relating to production may be said to have begun about August 1, 1917. The total fixed profit on the 400 Standard-J planes was $620 per plane and the fixed profit on the 4000 DeHaviland-4s was $875 per plane, making a total of $3,748,000. With the saving as now estimated of approximately $2600 under the original bogey cost of $7000 the additional profit of 25 per cent. of this saving would amount to $650 per plane, making the total profits on the DeHaviland contract about $1525 per plane. At the present rate of deliveries the contract for 4000 DeH-4s will be completed before March 1st next. The total profits on the 4000 DeH-4s would have amounted to upwards of $6,100,000, and it is safe to say that including the profit on the Standard-J planes, the Company would have earned a profit of more than $6,350,000 under the original contract. This does not include whatever profits would have been made on its experimental contract or on the spares for DeH-4s. It should also be added that under its contract it was provided, in substance, that at the completion or cancellation of its contract the Government should pay the difference between the cost of its plant, including real estate, building, machinery and appliances built or otherwise acquired for the performance of the contract, less what was found to be the fair market

value at the time when the contract was completed or cancelled, and that in determining (through a board of appraisers) this fair market value, the need or requirement of such a plant in the neighborhood and the probability of securing a tenant promptly, or having an established business available, should be considered as one of the important factors.

In the case of the Fisher Body Corporation, which had the other large order for De-Haviland-4 (4000), as well as an order for 400 Standard-Js, the profits would certainly not have been less. Instead of establishing a new plant, as did the Dayton Wright Company, the Fisher Body Corporation had already effected a highly efficient organization and had an established plant which required, however, a considerable expansion of plant facilities and special equipment. The net investment in fixed assets, including building, land and machinery, which was made by the Fisher Body Corporation for the Government work amounted, to May 31, 1918, to $860,849.05. The Corporation was aided by an advance through the War Credits Board of $2,000,000, made last December. Waiting for the necessary drawings, it got into production later than the Dayton Wright Company and up to October 11, 1918, had only delivered 452 planes. But it should complete its production of the entire 4000 within the next six months.

As already stated, in accordance with letters obtained at the time the contracts were made with the Dayton Wright Airplane Company and the Fisher Body Corporation, which promised an equitable readjustment if it was found that the bogey cost was too high, it appears that contracts are now being negotiated for the reduction of the bogey cost of the DeH-4s to $5000 and the fixed profit to $625 per plane. The total profit per plane with the percentage of saving (exclusive of profit on spare parts) under the new contract would amount to about $775 per plane, or $3,100,000 in all, which with the profits on spare parts would make the total profit on the DeHavilands not less than $3,500,000.

Liberty Engine Contracts

The bogey cost, as first fixed in the contracts for Liberty engines was $6087. This was approved by Mr. R. H. White, of Cleveland, and Mr. Henry May, of Buffalo, to whom the propriety of the estimate had been submitted by the Secretary of War. The fixed profit as originally stipulated was 15 per cent. of this bogey cost, or $913.05 per engine. Lieut.-Col. Hall (who had had large experience in engine manufacture) testifies that he made an estimate about the time that contracts were being let, and told Colonel Deeds, that $2400 would cover the cost of labor and materials for the Liberty engines, without overhead charges.

In December 1917, the bogey or estimated cost was reduced to $5000 and the fixed profit put at 12½ per cent. of this sum, or $625 per engine, and the contracts with the Packard, Lincoln, and Nordyke & Marmon Companies were modified accordingly. This was in consideration of further allowances for depreciation and provision for advances by the Government. In last May, the contract with the Ford Motor Company was modified by the same reduction of the bogey cost and fixed profit. The contracts with the General Motors Company were put upon the same basis.

Even at this reduced bogey and percentage, the profits allowed were very large.

By September 6, 1918, that is within a year from the date of the contract, the Packing Company had delivered (according to the Government's report) 3100 Liberty-12s, and the agreed fixed profit on these amounted to $1,937,500. In the following month it produced 560 and it should complete its deliveries of the 6000, first contracted for, not later than January, 1919, and on these 6000 engines the agreed fixed profits would be $3,750,000. This profit it would earn within seventeen months after it received the contract, and if it could have completed the deliveries as contemplated when the contract was made, that is according to contract schedule, the profit would have been earned in eleven months. Only the fixed profit has been mentioned as this was definitely guaranteed, but in addition to this the Company was entitled to 25 per cent. of its saving under the bogey of $5000. The Government's estimate is that the actual cost of the first 600 Liberty engines produced at the Packard plant was $3873 per engine, and that the average cost of the first twelve hundred motors was thus $3442 per engine. It would seem that the actual cost of the entire 6000 is likely to be somewhat under $3200 per engine. But on the basis of $3200 there would be an additional profit, through the contractor's percentage of saving, of $450 en engine, which would make $2,700,000 additional profit, or with the fixed profit of $3,750,000 a total profit of approximately $6,450,000 earned on the 6,000 engines, within a year and five months, despite delays in production. To this there should still be added a considerable amount for profits on spare parts on the 6000 engines which may be estimated at upwards of $1,500,000, and thus the aggregate profits on the Liberty engine (exclusive of the original development work) would reach about $8,000,000. The Packard Company estimated that on May 31, 1918, from the standpoint of plant values, the total investment exclusively for aircraft motor work was $11,808,404.47. This included, however, advances by the Government for working capital amounting to $2,145,568, and inventory and other items which would be represented in the cost of labor and material ultimately defrayed by the Government. The proportion of its plant, less depreciation, employed on aircraft work was estimated by the Company at $5,500,000. It should also be noted that in the contract reducing the bogey cost and fixed profit, it was provided that on the termination of the contract the Government should pay for depreciation upon the heat-treating building and equipment erected by the contractor for the purpose of carrying out the contract, the difference between their cost and "the value thereof to the contractor for use in its business," as determined by a board of appraisers; and that in determining this value the appraisers should be guided by the use the contractor "shall have for said building and equipment at the termination of said contract, in the ordinary operation of its business of manufacturing motor cars and trucks, and shall not include the value, if any, which the same may have to the contractor in the manufacture of further aviation motors." The Government was also to pay the full cost of facilities for testing and inspecting the engines, including the building and equipment erected by the contractor therefor, and should also reimburse the contractor for the machine tools purchased especially for the construction of aviation engines, to be used by the contractor without rental but to remain the property of the Government.

The contract with the Ford Motor Company was for 5000 Liberty engines. The Company did not begin its deliveries until the 14th of June. It was estimated by its officers that deliveries would reach 1500 in October, and that the entire contract would be completed by the first of December. It is behind in its schedule, but between September 6th and October 4th it delivered, according to the Government's records, 768, and it may be expected that it will complete its contract for 5000 by the end of January, 1919. Under the original contract it would then be entitled to fixed profits on the 5000 engines of $3,125,000. and the additional percentage of the saving under the bogey cost of $5000. With its well-known efficiency, and in view of the fact that by beginning later it did not have as much difficulty as the Packard Company had experienced, it may be assumed that the actual cost of the 5000 engines at the plant of the Ford Company will be less than $3200 per engine and at the rate of $450 an engine (that is 25% of the difference betwen $3200 and $5000) its additional profits would amount to $2,250,000, or its aggregate profits on the 5000 engines, would be $5,375,000, earned by January, 1919. The plant investment required for this production certainly can not be regarded as any greater than that on the part of the Packard Company. The Ford Company has not received advances from the Government. The Ford Company also has a contract for 400,000 cylinder forgings for the Liberty engine, on a fixed price basis of $8.25 each; these are supplied to the other manufacturers. The contract with the Ford Company for the Liberty engines provides that there shall be allowed for depreciation on the machinery and buildings especially acquired for the performance of the contract, in addition to the facilities already owned by the contractor, the difference between the fair cost and the fair market value as determined by appraisers at the time of the completion or cancellation of the contract.

The Lincoln Motor Company has its special feature in that it was a new organization and established a new plant which is devoted exclusively to the manufacture of Liberty engines for the Government. It was a highly expert organization, with Mr. Henry M. Leland at the head. When the bogey or estimated cost was reduced from $6087 per engine, with a fixed profit of 15 per cent., to $5000 per engine, with a fixed profit of 12½ per cent., the Government made a special agreement with reference to depreciation, which is thus summarized in a resolution of the Aircraft Board:

"That the Government make an allowance for depreciation of the Company's heat treating plant equal to the difference between the cost thereof and the value to the Company of the business at the termination of the contract; further, that the cost of the Company's testing plant be allowed as a part of the production cost of the engines to be manufactured; further that the machinery and equipment used by the Company in the performance of the contract be depreciated 40 per cent. over the term of the contract."

The Government made advances during the last fiscal year to the extent of $6,500,000; additional advances were made in July and August of $4,300,000, in order to discharge obligations and maintain a capacity of 1500 engines a month, making the total sum advanced by the Government of $10,800,000.

The Lincoln Motor Company has delivered, according to the Government's report, only 580 motors by the end of June, but it had reached a production of over 600 per month by October 4, and doubtless will soon be at full capacity so that the first 6000 motors will probably be delivered before the end of January. For the first 600 motors the cost of production at the plant of the Lincoln Motor Company was $3583, which was nearly $300 per motor less than that of the Packard Motor Car Company, and it may be assumed that its average cost for the entire $6000 will not be much, if any, more than $3000. That is the figure which appears in the Company's estimate of profit. But on the basis of an actual cost of $3200 per motor the Lincoln Motor Company would have earned by January, 1919, (through fixed profits, and percentage of saving) on the delivery of the 6000 motors, about $6,450,000. There would also be profits on spare parts, which are estimated at upwards of $1,500,000 more, making an aggregate profit of about $8,000,000. This would be exclusive of allowances by way of depreciation. The investment in real estate, buildings, machinery and equipment (exclusive of the special tools to be paid for by the Government, and the cost of testing and inspection facilities on which there is to be a depreciation allowance of 100 per cent.) amounts to approximately $7,150,000, of which $3,460,000 is the cost of machinery, tools and equipment (to July 31, 1918) on which the Government is to pay a depreciation allowance of 40 per cent., in addition to profits. The entire paid-in capital of the Company amounts to $850,000. At the outset, the Company obtained on the credit of its officers about $2,000,000 which served its purposes until it obtained the amounts needed for its plant, equipment and working capital, through advances by the Government. It is pointed out very clearly that the resent only an equity in its plant without any assured business, as it has been devoted exclusively to Government work. On the other hand, it may be said that there is a very liberal flat depreciation allowance on machinery, tools and equipment; that the plant is a permanent one, admirably designed for commercial work, and not merely for a temporary exigency, and that there is every prospect that it can be successfully utilized. It should also be said that from the standpoint of the Government it was free to make arrangements with existing plants, and the amount of the profits it should allow should be determined accordingly.

It is unnecessary to review the original contract with the Nordyke & Marmon Company, which is very far behind in its deliveries, and with the General Motors Company (Cadilac and Buick plants). The profit allowed per engine was the same as in the other contracts, but the contracts were for fewer engines, 3000 in the case of the Nordyke & Marmon Company, and 2000 in that of the General Motors Company. The Nordyke & Marmon Company received advances of $2,000,000. There were no advances to the General Motors Company.

The large percentage of the contractors' profits which will be taken by the Government in taxation is strongly emphasized and, of course, what the Government takes back through taxation should fairly be taken into account. But the contemplated tax does not justify an extravagant scale of profits which, even after payment of taxes, would permit an excessive return upon the capital invested, in view of the greatly reduced risks of the contractor under the cost-plus contracts. Company has provided an excellent plant for the manufacture of Liberty engines and that ultimately its profit, after paying taxes, will rep-

Revised Contracts for Liberty Engines

What has been said above relates to the original contracts for Liberty engines. During a recent period the contracts with the Lincoln Motor Company, the Packard Motor Car Company and the Nordyke & Marmon Company have been revised and put upon a fixed-price basis of $4000 an engine.

The revised contract with the Lincoln Motor Company is dated July 31, 1918. The former contract for 6000 engines is cancelled and superseded and the new contract provides for 9000 U. S.-12s and necessary spare parts, with an option to the Government to require the production of 8000 additional engines and spare parts. The schedule of deliveries provided for in the new contract is as follows:

Previous to August 1, 1918	1,000
August	750
September	1,000
October	1,500
November	1,500
December	1,500
January, 1919	1,500
February	250

The price is $4000 an engine. The spare parts are to be delivered on a schedule basis corresponding to a total price of $4000 for a

completed engine. The contract provides for payments by the Government, by way of amortization upon a basis of 100 per cent., of the actual cost of all testing and inspecting facilities provided by the contractor with the approval of the Government; for payment by the Government, by way of amortization upon a basis of 40 per cent., of the actual cost of the heat-treating building and equipment theretofore provided by the contractor; and payment by the Government, by way of amortization upon a basis of 40 per cent., of the actual cost of all machinery, tools and other items furnished by the contractor. It is further agreed that in case the Government shall not order from the contractor the 8000 additional engines for which it has an option, or the contractor is prevented by termination of the contract from manufacturing and delivering the 9000 engines contracted for and the 8000 additional engines, the Government shall pay to the contractor a sum equal to 40 per cent. of the difference between the actual cost of its plant, including real estate, buildings, machinery and equipment built or otherwise acquired by it for the purpose of performing the contract, (exclusive of any allowance of interest) and any and all payments previously made by the Government on account of depreciation or amortization. While the new contract is on a fixed-price basis, provision is made for payments by the Government within ten days of the termination of the various items, on account of the cost of direct materials, supplies and labor, and also for the payment monthly of amounts equal to proper ordinary depreciation, and other proper items of overhead expense not previously paid by the Government. It is also provided that in case the actual cost of manufacture shall be increased or decreased by reason of any changes in specifications or in the rates of labor, material, supplies or equipment, varying from the rates in force at the date of the revised contract, upon satisfactory proof, the contractor shall be paid the total amount of such increases, in addition to the fixed price, or in case of a decrease the fixed price shall be reduced accordingly.

Up to October 4th the Lincoln Company had delivered, according to the Government's report, 2,566 engines, instead of the 2,750 required by the schedule to October 1st, and it is likely to be somewhat behind its schedule in the total deliveries, but its deliveries of 9000 should be completed by March next. It may be assumed, as the Company assumes in its own estimate, that the 9000 motors can be produced on an average cost of $3000 each, which would leave $1000 profit per engine, exclusive of the spare parts, making a profit on the engines of $9,000,000 earned, it may be expected, by April 1st; and assuming that the profit on spare parts will be 25 per cent. of the profit on the motors, there would be an additional profit of $2,250,000. On this basis the entire profits earned by the Company on the Liberty contract would be $11,250,000.

The new contract with the Nordyke & Marmon Company was made under date of August 31, 1918. The former contract for 3000 Liberty engines is cancelled and the substitute contract calls for 5000 U.S.-12s and spare parts, with the option of the Government to order 2000 additional. The schedule of deliveries is as follows:

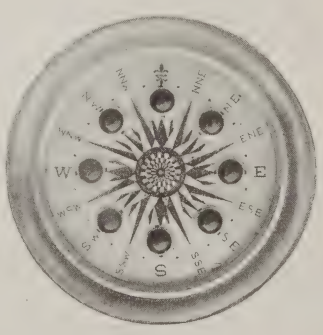
1918					1919							
Aug.	Sept.	Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	April.	May	June	July	Aug.
50	70	250	300	400	400	475	500	500	500	500	500	500

The contract is on the basis of a fixed-price of $4000 per engine, with a provision for increase or decrease in case of a change in the actual cost of manufacture, similar to that contained in the revised contract with the Lincoln Company. The contract also contains a provision for special depreciation which is somewhat involved, and need not be set forth.

The revised conract with the Packard Motor Car Company was made under date of September 2, 1918. It supersedes the original contract and provides for 12,000 U.S.-12s at a fixed price of $4000 per engine, and spare parts on the basis of this price for a completed engine. It contains provision as to an increase or decrease of price in case of a change of the cost of manufacture similar to that found in the other revised contracts above mentioned. The Packard Company agrees to deliver the articles at the rate of 600 engines a month, beginning with September 2, 1918. As the Packard Company had delivered 2660 engines up to October 4, 1918, the entire 12,000 will be delivered approximately by December, 1919. It is likely that the cost, distributed over the 12,000 engines, will not be more than $3000 an engine, and at this rate the profit on the 12,000 engines will amount to $12,000,000, with probably $3,000,000 more as the profit on spares, making about $15,000,000 in all.

Under the original cost-plus contracts for the Liberty engines, that is, with the bogey cost of $5000, a fixed profit of 12½ per cent. thereon, and an additional profit of 25 per cent. of the savings under the bogey cost, the total profits per engine would amount to $1075 on the basis of an actual average cost of $3200 per engine, or to $1125 on the basis of an actual average cost of $3000 an engine. It will thus be seen that the change from the cost-plus contracts to the fixed-price contracts saves the Government from about $75 to $125 (or possibly a little more) per engine, on the fixed-profit allowance, and also whatever expense may be saved by the reduced requiremnts of cost supervision and accounting and in connection with material. Upon the new fixed-price contracts the contractor's profits, though reduced, still remain very liberal.

It is understood that it has been arranged that similar revised contracts on a fixed-price basis will be made with the Ford Motor Company and the General Motors Company, but these had not yet been executed according to the latest information received.



THE SHOTWELL ELECTRIC WEATHER VANE FOR AERODROMES AND POSTMASTER'S OFFICE

Gives Wind Directions Far and Near

THE Shotwell Electric Weather Vane, patented and made by the Shotwell Weather Vane Company, of 299 Madison Avenue, New York City, is a very useful article for aerodromes, for the offices of field superintendents, postmasters, commanding officers and flying officers of Army, Navy and Marine Corps aerodromes—and anybody interested in aeronautics, boating, motoring, meteorology, etc., etc.

It is a simple device consisting of a vane and a dial which permits a person in his office or home to know when the wind changes near or far. When he wants to know the direction of the wind over his building—or twenty-five or fifty miles away—he presses a button, and the light on the dial shows the direction of the prevailing wind wherever the vane is located.

The Second Asistant Postmaster General and the Superintendent of the Aerial Mail, who have charge of the Aerial Mail Service in Washington, can, by pressing a button, see the exact direction of the wind at any point on any of the Aerial Mail routes. Knowing the direction of the wind they know whether the aviator has a head wind or a following wind or a cross wind, and can estimate whether he will arrive late or ahead of time.

From the changes in wind directions they will also know whether rain or fair weather is to be expected.

Prevents Loss of Equipment Through Sudden Storms

The Commanding Officer or the flying officer or superintendent at an aerodrome can see the changes of the wind from his desk and can order the direction and landing arrows moved, so the landing aviators will know the direction of the prevailing wind, and will land against the wind.

The change in wind direction also warns of approaching storms, in which case the field must be cleared of aeroplanes and equipment and preparations must be made, where electricity is generated by a local plant, to prepare for the approaching darkness.

Passing aviators are warned of the approaching storm by ground signals or lights, so they can land and house their machines until the storm is over.

The Shotwell Electric Weather Vane records the exact direction of the wind at any time, regardless of the distance from the vane to the dial. As many dials may be used in conjunction with one vane as may be desired, so that the commanding officer, the flying officer and the chief of squadron can all get the wind directions from one single vane. If a very accurate reading of the wind is desired, the dial may be so arranged as to give thirty-two directions. This is much closer than the eye can read.

The Shotwell Weather Vane also permits the scientific study of wind

currents. Six vanes installed on different points between New York and Washington will permit the authorities to know the exact wind conditions prevailing at any point along the aerial mail route at any time. By making the records of the changes of wind currents over a given route a valuable contribution can be made to science.

The dials are of a very neat design, either in nachomez or brass shells about eight inches in diameter. They are generally installed on a sidewall, so that the wires leading from the vane will be concealed, or on a desk. The light can be kept on, so that the direction of the wind can be seen at a glance without pressing the button. The installation is simple and the vane can be installed equally as well on a skyscraper as it can on a hangar or country home.

People who fly for sport or travel and need not fly unless the weather is favorable, can save themselves the trouble of preparing for a flight—or for an automobile or yacht ride, for that matter—by getting the direction of the wind from the Shotwell Weather Vane.

(*Continued from page* 655)

General Burleson, Washington; Second Assistant Postmaster-General Otto Praeger, Washington; Rear Admiral Robert E. Peary, President, Aerial League of America, Washington, and the presidents of various aero clubs throughout the country and other authorities and the magazines *Flying* and AERIAL AGE, which have been foremost in urging and making possible the establishment of Aerial Mail Service.

To celebrate Thanksgiving Day and the fact that hundreds of aeroplanes have been turned over to the Post Office Department to extend the Air Mail Service under the direction of Captain Benjamin B. Lipsner, Superintendent of the Service, and thereby provide an immediate opportunity to utilize the valuable services of military aviators who have served their country in time of war, the officials of the Aero Club of America, the Aerial League of America, and a few aeronautic authorities, accepted the invitation of Captain Lipsner to eat their Thanksgiving dinner in the air on board of one of the giant Handley Page machines that have just been turnd over to the Post Office Department at the new flying field opened at Elizabeth, New Jersey. From this field the first flight with mail to Washington left during the ceremonies and contributed a business-like touch to this epoch-making event in the history of the "Cloudland Mail."

Prior to the banquet, Mr. Alan R. Hawley, Vice-President of the Aerial League of America, conferred honorary membership in the League upon Captain Lipsner and presented him with the bold button emblematic of this signal distinction.

The various stages in the rapid development of the Air Mail Service were graphically shown when the three aeroplanes, representing each stage of advancement, were lined up on the field; the first type was a military training plane used before the Post Office Department secured its own machines built for them by the Standard Air Craft Corporation and delivered on August 6, 1918; the second type was one of these Post Office Department machines which was flown by Pilot Max Miller, and a rousing send-off was given to him when he left the field carrying the mail sacks for Washington and disappeared in the thick haze hanging over the field. The third type was the giant Handley Page which will carry a ton and a half of mail between New York and Chicago on the second permanent air mail route to be established.

A typical Thanksgiving turkey-dinner was spread out in preparation for the aerial banquet which was to follow in the cabin on the board the Handley Page. Mr. E. W. Pennewill, Vice-President of the Standard Company, and his wife; Captain Waller of the Royal Air Force, and his wife; Mr. and Mrs. Charles H. Day, Mr. Meyrick and the Postmaster of Elizabeth, joined in with Mr. Alan R. Hawley, Captain Lipsner, Mr. Henry Woodhouse, Mr. Leroy B. Gulotta and Mr. Augustus Post, who were going to dine in the aeroplane piloted by Captain Waller, and drank a toast to the globe trotters of the future who would have all the luxuries of travel in the dining compartment de luxe of their earth circling flying craft.

As a fitting tribute to the proud meaning of this National Day of Thanks and the momentous occasion when aerial navigation was passing from the limited state of transporting mail alone to general passenger travel, and as a natural expression of the thought uppermost in the mind and throb in the heart of all Americans, a few words were spoken in harmony with the spirit of the occasion and those assembled bowed their heads for a moment. Mr. Augustus Post, Secretary of the Aerial League of America, said:

"We are here to celebrate a historic moment in the annals of American achievement. A splendid victory has been won for the cause of Freedom, Justice and Humanity.

"We cannot give thanks for all our blessings without contributing a thought to the sacred memory which we all have for the brave and heroic men who have given their lives for the cause for which our Country and our Allies have been fighting.

"A bigger work is now before the world—to perfect the 'Pacts of Peace', to extend the principles of Freedom, to follow up our glorious victory and make a lasting state of harmony among the people of the earth and a permanent League of Nations.

"The areoplane will bear a great part in bringing about the glorious result and in uniting all the peoples of the globe."

November 28, 1918.

President Woodrow Wilson, Washington, D. C.

We, who are having Thanksgiving ceremony and dinner on board of the three-ton Handley Page post office mail aeroplane, extend our heartiest congratulations on inauguration of the Aerial Age by the Post Office Department. A nw epoch has dawned for the commerce of America and of the whole world. We all join in Thanksgiving for the stupendous victory achieved and for the realization of our hopes which we confidently believe will soon be followed by results of the utmost benefit to civilization when the marvelous developments in military aeronautics are turned to utilitarian purposes and aerial mail service is established throughout the United States.

(*Continued on page* 682)

The passengers who enjoyed their Thanksgiving Dinner in a Handley Page Biplane. Left to right: Henry Woodhouse, Capt. Lipsner, first Superintendent of the Aerial Mail Service, Alan R. Hawley, a British aviator, Augustus Post, Charles H. Day, J. M. Meyrich and Leroy B. Gullotta

NAVAL and MILITARY AERONAUTICS

Key to Abbreviations

AAD—Assigned to active duty.
ABC—Report to Army Balloon School, Arcadia, Cal.
ABC—Report to Army Balloon School, Arcadia, Cal.
ADO—Report to Aviation Supply Depot, Dayton, Ohio.
ADT—Report to Aviation Supply Depot, Dallas, Texas.
AFO—Report to Aviation Supply Depot, Fairfield, O.
AGC—Report to Aviation Supply Depot, Garden City, L. I., N. Y.
AHT—Report to Aerial Gunnery School, Houston, Texas.
AIR—Transferred to the Air Service, National Army, without change in rank or date of commission.
ALF—Report to Camp Alfred Vail, Little Silver, N. J.
AMV—Report to Aviation General Supply Depot, Morrison, Va.
AOV—Report to School for Aerial Observers, Hampton, Va.
APR—Report to School of Aerial Photography, Rochester, N. Y.
ARV—Report to Aviation Supply Depot, Richmond, Va.
ASM—Report to Aviation Mechanics' Training School, St. Paul, Minn.
BFT—Report to Barron Field, Fort Worth, Texas.
BRN—Report to Bakers Field, Rochester, N. Y.
BST—Report to Brooks Field, San Antonio, Tex.
CAF—Report to Carlstrom Field, Arcadia, Fla.
CAP—Commissioned as Captain, Aviation Section, Signal Corps.
CDT—Report to Aviation Concentration Camp, Dallas, Texas.
CFT—Report to Carruthers Field, Fort Worth, Texas.
CGC—Report to Aviation Concentration Camp, Garden City, L. I., N. Y.
CGS—Report to Aviation Concentration Camp, Greenville, S. C.
CIT—Report to Radio School, Carnegie Institute of Technology, Pittsburgh, Pa.
CJS—Report to Camp Jackson, Columbia, S. C.
CJW—Report to Camp John Wise, San Antonio, Texas.
CLR—Commissioned as Colonel, Aviation Section, Signal Reserve Corps.
CMV—Report to Aviation Concentration Camp, Morrison, Va.
CPA—Commissioned as Captain Air Service, National Army.
CPR—Commissioned as Captain, Aviation Section, Signal Reserve Corps.
CRI—Report to Chanute Field, Rantoul, Ill.
CSO—Report to the Chief Signal Officer, Washington, D. C.
CUI—Report to School of Military Aeronautics, Cornell University, Ithaca, N. Y.
CWT—Report to Call Field, Wichita Falls, Texas
DAF—Report to Dorr Field, Arcadia, Fla.
DAP—Report to Director of Aircraft Production, Washington, D. C.
DIK—Report to Camp Dick, Dallas, Tex.
DIS—Honorably discharged from service.
DMA—Report to Director of Military Aeronautics, Washington, D. C.
ELA—Report to Eberts Field, Loanoke, Ark.
EOT—Report to Ellington Field, Olcott, Texas.
FLA—Commissioned as First Lieutenant Air Service, National Army.
FLR—Commissioned as First Lieutenant, Aviation Section, Signal Reserve Corps.
FLT—Commissioned as First Lieutenant, Aviation Section, Signal Corps.
FOB—Report to Fort Omaha Balloon School, Omaha, Neb.
FRF—On duty requiring regular and frequent aerial flights.
FSO—Report to Fort Sill School for Aerial Observers, Fort Sill, Okla.
GIT—Report to School of Military Aeronautics, Georgia Institute of Technology, Augusta, Ga.
GLC—Report to Gerstner Field, Lake Charles, La.
HHN—Report to Hazelhurst Field, Mineola, L. I., N. Y.
JMA—Rated as Junior Military Aviator.
JRC—Report to Jackson Field, Riverside, Cal.
KST—Report to Kelly Field, So. San Antonio, Tex. (When specified in the order, the number of the field is given in parentheses)
LDT—Report to Love Field, Dallas, Tex.
LHV—Report to Langley Field, Hampton, Va.
MAC—Report to March Field, Allesandro, Cal.
MAJ—Commissioned as Major, Aviation Section, Signal Corps.
MAT—Report to Mather Field, Sacramento, Cal.
MDO—Report to McCook Field, Dayton, Ohio.
MIA—Report to U. S. Naval Air Station, Miami, Fla.
MIT—Report to School of Military Aeronautics, Massachusetts Institute of Technology, Boston, Mass.
MJA—Commissioned as Major Air Service, National Army.
MJR—Commissioned as Major, Aviation Section, Signal Reserve Corps.
MSC—Report to Radio School, Maryland State Agricultural College, College Park, Md.
OBS—Attached to the Aeronautical Service as Observers.
OSU—Report to School of Military Aeronautics, Ohio State University, Columbus, Ohio.
PFO—Report to Post Field, Fort Sill, Okla.
PMT—Report to Park Field, Millington, Tenn.
PUP—Report to School of Military Aeronautics, Princeton University, Princeton, N. J.
PWM—Report to Payne Field, West Point, Miss.
REL—Relieved from present duty.
RSD—Report to Rockwell Field, San Diego, Cal.
RTR—Retransferred to organization attached to previous assignment to aviation duty.
RWT—Report to Rich Field, Waco, Tex.
SBI—Report to Scott Field, Belleville, Ill.
SAG—Report to Souther Field, Americus, Ga.
SGS—Report to Camp Sevier, Greenville, S. C.
SLA—Commissioned as Second Lieutenant Air Service, National Army.
SLR—Commissioned as Second Lieutenant, Aviation Section, Signal Reserve Corps.
SLT—Commissioned as Second Lieutenant, Aviation Section, Signal Corps.
SMA—Report to School of Military Aeronautics, Cambridge, Mass.
SMM—Report to Selfridge Field, Mount Clemens, Mich.
SRC—Report to Columbia School for Radio Officers, New York City.
TFT—Report to Taliaferro Field, Fort Worth, Texas. (When specified in the order, the number of the field is given in parentheses)
TMA—Report to Taylor Field, Montgomery, Ala.
UCB—Report to School of Military Aeronautics, University of California, Berkeley, Cal.
UIU—Report to School of Military Aeronautics, University of Illinois, Urbana, Ill.
UTA—Report to School of Military Aeronautics, University of Texas, Austin, Tex.
VBW—Report to Vancouver Barracks, Washington.
WAC—Report to Aviation Concentration Camp, Waco, Tex.
WCS—Wire to the Chief Signal Officer upon arrival.
WDM—Wire, Director of Military Aeronautics, upon arrival.
WFO—Report to Wilbur Wright Field, Fairfield, Ohio.

The French Salmson Biplane, equipped with Hispano-Suiza motor

FOREIGN NEWS

60 Lafayette Fliers Lost

Paris.—At a dinner given by American aviators in honor of their French comrades in the air service, it was announced by the Under-Secretary of Aviation that of 240 American fliers in the Lafayette Squadron, sixty had lost their lives. Many of the most noted French airmen, including Lieutenant René Fonck and Captain Heuteux, as well as Italian aviators, were present at the dinner, which was of the most cordial and intimate character.

The French Aero Club will give a banquet on December 5th in honor of allied airmen who have escaped from German captivity. On the same evening a medal will be presented by the club to Gabriele d'Annunzio, the Italian author-aviator.

Armistice Saved Berlin from a Big Air Raid

London.—The Royal Air Force had completed all preparations for the bombing of Berlin on November 9th with nineteen Handley Page planes, each carrying 3,500 pounds of bombs, according to an official report published in the *Evening Standard*. The weather proving bad, however, the raid was postponed until November 11th, but the armistice was signed that same morning.

Prince Killed by Aeroplane Fall

London.—Prince Antoine Gaston Philippe of Bourbon-Orleans, great-grandson of King Louis Philippe of France, has died in a military hospital from injuries suffered in the fall of an aeroplane.

Report Air Fleet Wrecked

Basle.—One hundred and fifty aeroplanes which had been gathered at the Boeblingen Aerodrome, eleven miles southwest of Stuttgart, to be handed over to the Allies in accordance with the provisions of the armistice, have been rendered useless by order of the Revolutionary Committee, according to a Stuttgart dispatch received here.

British Air Losses 7,589 in Eight Months

London.—Casualties in the Royal Air Forces from April to November 11th were: Killed, 2,680; wounded, missing and prisoners, 4,909; totaling 7,589, according to an official statement by the Air Ministry.

Allied Aircraft in Adriatic

Mr. James Bone, writing in the "Daily Telegraph" of October 3rd, concerning the work of the French Navy, says:—

The Air Forces operating over the Adriatic include important British and American squadrons. In this matter a distinguished British naval commander here pointed out, not without warmth, that very little attention had been given at home to the fact that British flying squadrons in the south of Italy were regularly flying across the Odriatic to attack Durazzzo and Cattaro, which meant flying overseas a distance of about 240 miles, there and back, not on seaplanes, but on aeroplanes. If a machine got a splinter in its engine or had its tank cut, and it had to come down on the sea, it was all up with the aviator. Compared with these exploits the overland trip to attack Constantinople was an easy business.

New Use for German Aeroplanes

Paris.—A German aeroplane arrived November 15th at the French lines bearing an urgent message from the mayor of Mulhausen, asking that a French regiment be sent there to maintain order. The population, full of enthusiasm, has risen against the Germans, who are retiring in the utmost disorder, according to the *Echo de Paris*

12 German Aviators Land on Swiss Soil

Bern.—No less than twelve German aviators landed on Swiss soil Wednesday and Thursday. They came from the western front and said they had lost their direction, but it is believed that some of them came to Switzerland to be interned.

Made 709 Bombing Raids

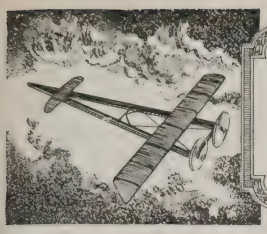
London.—Statistics published relative to the work of the independent air forces show that during the thirteen months preceding the armistice the astonishing number of 709 bombing raids were made by British aviators over German territory.

There were 374 raids on large German towns; 209 on German airdromes established for the defense of the Rhine, and 126 on other military objectives. The list of large towns visited shows that fifty-two were bombed during the period. In all 737 tons of bombs were dropped.

Aerial Transport in Scandinavia

A large Swedish air transport company has been formed with a capital of 1,000,000 kr. (£55,500), with its headquarters at Malmo. The aerial line will run Malmo-Stockholm-Gothenburg-Malmo. It is contemplated to open communication with Germany, Denmark, and Finland in the future.

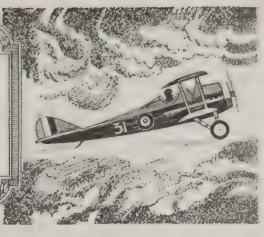
Aerial Mail for Greece



Athens and Salonika are being postally joined up via the air. General D'Esperey has, by reserving a number of machines for the purpose, made this possible, which follows upon a service between Athens and Janina, which is now to be made a regular delivery. This is but a beginning, so it is said, Greek enterprise hoping to be well in the front in the field of aerial mails.

Argentina Wanting Aeroplanes

The Republic of Argentina has always displayed a desire to keep its fighting forces up to date, and the Government has laid before the Chamber a Bill asking for £16,000,000 for the purchase of warships, submarines, aeroplanes and merchant vessels.



The twin-motored Caudron Biplane, equipped with Hispano-Suiza motors

Aeroplane Building as a Step to Aeronautical Engineering

I BELIEVE we have sufficient knowledge to construct the Light Horse-Powered Machine we have in mind. Of course our technical end of Aeroplane design was not fully covered, but what we did work out can be applied along with new data, which we will select as we go along. Obstacles will be encountered, but we will not become discouraged or all our previous work will be lost. The prospective builder need not have a thorough knowledge of Aeroplanes to build a large aeroplane, but it will be just "Luck" and nothing else if it flies. Of course the drawings which will accompany the articles will be descriptive and as clear as possible. If the reader follows out these plans to the letter he will have no trouble whatever.

The first step an aeroplane builder must take is to find a suitable motor. I would advise the reader not to attempt planning or building a large aeroplane unless he has a motor and a good one at that. Only too many successful model builders have started to build a big machine with the idea of using a certain motor, then after building it they find that the motor they had in mind has been sold, or perhaps out in the junk heap, which means the whole machine is discarded or must be altered for some other motor. So do not attempt to build an aeroplane unless you have your motor and it has been tested out in every way. The motor we will use is the regular Ford Motor, of course removing the heavy fly-wheel, transmission, etc., which lightens the motor considerable. Other changes could be made to save weight, but it would mean considerable machine work must be done by an expert machinist and we can use the motor as it is almost as well.

Some builders would rather use some other make of motor, which would be of greater weight. It will be necessary for the builder to have a good knowledge of aeroplane in this case, otherwise he will have a good job on his hands balancing the machine, figuring the different speeds, aerofoils, etc., but if he has studied the articles which had preceded this he will be able to use any size or type of engine. As we progress with the machine we will study different data which is used in conjunction with the problems we encounter.

The cost of this machine can be kept low if the builder makes every part himself, and it should go over $300.00. This is the total cost; parts can be purchased as they are needed. For instance, all the lumber can be bought cut to the desired lengths and thicknesses for about $25.00; when these parts are shaped and ready to be assembled, the metal for the fittings can be bought for $25.00, and so on until the machine is complete.

(To be continued)

A Model of the Burgess Seaplane Scout

The model shown in the accompanying illustration was made by the American Model Company from drawings which appeared in AERIAL AGE, August 20, 1917, page 828. This model is constructed entirely of wood with metal ornaments, such as radiator, propeller hub plate, engine cylinders, and so forth. This model was on exhibition at different optical stores for the last six months, and it has attracted considerable interest and should be interesting to the readers of this page.

The body is shaped out of a solid block of white pine. The wings, tail, and rudder are made of soft white wood. Pontoons are constructed also of white wood. Details and insignia are painted on for effect. Comparison with photographs of the big Burgess Machine, which have appeared in AERIAL AGE, will show how exactly this little model has been made to scale.

A scale model of a Burgess seaplane made of wood

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

Cross Country

Up with the star of the morning,
Up with the crisp early dawn,
To the pale blue sky, my course I shall fly,
Ere the day full fledged is born.

And the sun peeps o'er the horizon,
And strikes on my silvery wings,
And the earth scuds by, as I speed through the sky,
While my being throbs and sings.

To race with the clouds and battle the winds,
To attact, to dive and to glide,
To spiral and loop, like an eagle to swoop,
To bank, and to slip on my side.

Cross the open fields toward the distant rim,
To a spired hamlet I fly,
For the night is dead and morning has spread,
Her glory across the sky.

P. Laurence Coe, 2nd Lt., A. S. A.

The Aviator's Ten "Commandments"—or There's Lots Worse Off Than You

Brought down from Heaven by Capt. Horace B. Wild, An American Aerial Pioneer.

I

When your Battle-plane you've wrecked—
In a tail-spin you have crash'd—
Your crack at the next show cancel'd
'Cause your bus is badly smash'd;

II

Still, your bones are all together—
Though of Huns you got but two,—
There's many a Pilot that you know
Who'd gladly trade with you.

III

Our team-mates fall—("Gone West" they say)—
Other flyers take the night;
There are many more behind you—
You're not the last one in the fight.

IV

When your heart is sad and heavy,
And you're feeling bad and blue—
Do you ever stop and think a while

'THERE'E LOTS WORSE OFF THAN YOU'?

V

When you look about with envy
On those who've more than you,
Do you ever pause and ponder
There's lots their wealth can't do?

VI

Will it buy a place in Heaven?
Could it buy Love—pure and true?
Could it buy those dearly loved ones
Who are waiting home for you?

VII

We spend so much time wishing
For the things we *'haven't got'*
That we can't enjoy the blessings
Which we have and know them not.

VIII

So, don't look on with envy—
'Twill make you sour and old;
You have many many blessings
That cannot be bought with gold.

IX

Do not fancy all are happy
'Cause they soar so high on wealth—
Why, all the money in the world
Could not buy one hour of health!

X

So, if you're well—be happy—
And thank God both day and night
For giving you what wealth can't buy—
A GOOD BIG APPETITE!

With compliments to my esteemed friend, from
Capt. H. B. Wild.

Nuff's a Nuff

An acting member of the 145th Squadron visited a dentist last week and was told that he had too much nerve, that a nerve in one tooth must come out.

"Nothing feazes me," the entertainer remarked. "Shoot."

The dentist began with a drill and then opened an offensive with the "nerve" hook.

"Does that hurt?" asked the dentist as he went "over the top" and captured the nerve.

"No—ow!" replied the entertainer, wishing to appear nonchalant and brave, although the "hook" was hooking him to the queen's taste.

"Gee, I must have missed it," said the dentist as he made another jab, much more successful, and the patient jumped up with a healthy, full-lunged howl.

"If I hadn't hollered, he might have pulled out a lung," alibied the O. D. actor.

(*Continued from page* 665)

after the explosion of the bomb, and shed a brilliant glare of light.

Instruments

The instrument equipment involved a great variety of problems.

The self-luminous radium dials required for practically all instruments immediately become a production problem.

How the General Electric Company in eight weeks' time were producing 250 airplane compasses per week and how the minute chains in the Aneroid Barometers which serve as altimeters were secured from Switzerland, how the air speed indicators are all calibrated in a wind tunnel and how the National Cash Register Company developed the techometer, are each stories of absorbing manufacturing interest.

Photography

At the outbreak of the war in 1914 aerial photography for military purposes was a new subject; no special camera equipment was available, neither was the equipment for developing and finishing negatives in the field with the extreme rapidity demanded.

The first aerial work was done with cameras held in the hands. These were quickly replaced by cameras attached to the side of the plane, and later working through the bottom of the fuselage.

The later development consisted of cameras supplied with plate magazines. The power to operate these magazines was furnished from a small windmill.

This general line of development went on to an automatic camera, which could be put in action by the pilot and given no further attention during a reconnoissance, leaving the pilot free to fly and fight.

Further development included a film camera for long range reconnoissance work.

At the outbreak of the war it was possible for the aerial photographer observer to fly at low altitudes but as the importance of photography increased, the enemy were more aggressive in bringing down photographic observers. This fact greatly increased the altitude from which photographs could safely be taken, and it was frequently necessary to make exposures from an altitude of 17,000 feet. This increase in altitude required lenses of longer focus and a number of cameras having 50-inch lenses were employed.

The remarkable definition and detail obtained is illustrated by the photographs shown on the wall. Long experience in interpreting photographs has made possible the location with absolute accuracy of concealed batteries, machine gun nests, barbed wire, and even the paths followed by the soldiers.

The development of cameras and photographic equipment to get these really marvelous photographic results involved the most extensive optical, chemical and mechanical research work. Much of this had been carried to a high degree of perfection by our Allies, who sent the very best men they had to this country to aid in initiating the work in the United States.

Radio

Prior to the outbreak of hostilities in August, 1914, radio apparatus had not been used to an appreciable extent on aeroplanes. The development of suitable radio telegraph apparatus was undertaken and this method of communication soon became extremely important and valuable in fire control work, where observation planes are used to correct the firing of long rang artillery. At the time the United States entered the conflict satisfactory radio telegraph apparatus was in use by the combatant forces. Enormous improvements have been effected, however, by the Signal Corps and the Air Service of the United States, in apparatus designed for fire control telegraph signals. The sets which have been made and supplied in thousands to the American Expeditionary Forces are far superior to any apparatus developed by the other nations at war.

In April, 1917, the radio telephone for aeroplanes was in much the same state of development that the radio telegraph was in August, 1914. The aeroplane wireless telephone is by far the most striking method of using radio communication on aeroplanes. By means of this device the commander of an air squadron can direct by voice the movements of the entire group of aeroplanes under his command, thereby making the air squadron a real military unit. The recent developments in aero fighting abroad indicate the inestimable value of this ability to command the units of a squadron. Among other uses for the radio telephone is the communication which can be had between airplanes and ground by telephone, which may become of enormous importance in future use of aircraft. A pilot could thereby talk directly with a general, without intermediate delay and confusion.

A different type of apparatus recently developed enables the observer in an airplane to locate by means of radio signals sent from a land station his position with reference to certain fixed points. The observer can therefore direct the flight of the aeroplane in any predetermined manner by means of this radio compass. The uncertainty attached to the use of the magnetic and gyroscope compasses for aeroplanes make the use of the radio compass a practical certainty.

The problems encountered in working out suitable aeroplane radio apparatus have been principally eliminating the overwhelming effect of the noise of the motor; the reduction

THE NATIONAL TECHNICAL AND TRADE AUTHORITY

THE EDITORIAL CONTENTS

Printing the largest amount of editorial material, the editorial contents of AERIAL AGE include:

1. Editorials presenting always constructive suggestions concerning the substantial upbuilding of the American aeronautic industry.
2. Comprehensive and complete Trade and General news of the week from every point of the compass.
3. Technical contributions from leading authorities in the aeronautic world on aeroplanes, aero-motors and every other phase of aeronautics.
4. The complete official reports of the Army and Navy Air Services and published weekly together with articles by authorities on Military and Naval aeronautics, thereby insuring to the readers and advertisers a more complete representation of Army and Navy aeronautics than is afforded by any other publication in the United States.
5. A regular department presenting each week some important phase of military aerostatics, being the only magazine in the world to have such a department.
6. Complete reports concerning current aeronautic standardization work here and abroad.
7. Personal notes concerning the men upbuilding the aeronautic industry's affairs.
8. A digest presenting important events of the air services on the war fronts.
9. A page every week for the model enthusiast, giving views of the clubs and construction information.
10. A specially appropriate department in the French and English languages, giving valuable information and table, which our men who go overseas find most advantageous.
11. Last, but not least, a page of aeronautical humor in verse, prose and illustration.

ITS CLIENTELE—AERIAL AGE is read:

1. By **the Executive Heads** of every aeronautical concern in the country who relies upon its contents to inform him concerning the constantly increasing progress of the aeronautic industry.
2. By **the Executive, Engineering and Purchasing Military Authorities** of the United States and the Eighteen Allied Countries, and nine Latin-American countries who have severed their connections with Germany.
3. By **the Engineer** who looks upon it as the medium of information concerning every development of technical importance.
4. By **the Designer** who is made familiar with current progress throughout the world by articles, illustrations, and diagrams contributed by the world's technical experts.
5. By **the Purchasing Agent** who, in its advertising pages, finds a directory which gives the best and the latest products of the aeronautic industry.
6. By the Capitalist and progressive business men who recognize the fact that aeronautics, now one of the key industries, who look to AERIAL AGE for the opportunities afforded by the aeronautic industry, and to AERIAL AGE'S Service and Advisory Department for advice regarding investments.
7. By the Air Service Student who acquires a broad knowledge of what is happening in the Air Services in the United States, and Europe, and for whom we print special articles in French describing the machines with which he will require to become familiar.
8. By the Layman interested in aeronautics, who desires to be kept constantly and correctly informed on the current developments in the Aeronautic Industry and Movement.
9. By **the Juvenile Student** who is interested in model construction and for whom we print special articles of informative value. He will be the expert and the purchaser of the near future.

of weight to the smallest possible value; the necessity of absolute freedom from fire hazard; simplicity which would enable fliers untrained in the use of radio apparatus to operate the same; and eliminating the vibration of apparatus in the aeroplane.

Oxygen Equipment

One of the most important works undertaken by the Department of Military Aeronautics has been the maintenance and care of fliers. This endeavor has been carried on under the direction of Brig. Gen. T. C. Lystor through the Medical Section of the Department of Military Aeronautics. The most important device for maintaining the health and efficiency of the flier, is the oxygen apparatus which is designed to feed oxygen to the personnel of planes and maintain at all altitudes, atmospheric conditions and prevent the degeneration of the human organization.

The great necessity of efficiently maintaining fliers was brought about through a study of the English air casulties during the first year of the war. These were about as follows: 2 per cent. due to the Hun; 8 per cent. due to the plane; and 90 per cent. due to the men, which clearly indicated that something was radically wrong with the personnel, and immediate action was necessary. A thorough study of this situation disclosed the fact that practically all of the flying personnel was suffering from what was known as oxygen fatigue or lack of oxygen being caused by flying so many hours of the day at high altitudes and not securing enough oxygen to properly feed the body.

To design an oxygen equipment which would be entirely automatic, one that would be reliable and efficient, necessitated the building of a device which embodied several instruments and one that would overcome many variable conditions. It was necessary to have a device that would work under variable tank pressures from 100 to 2,250 pounds per square inch with a temperature range of from 70° to 80° F. to 20° or 50° below zero. To overcome these variables necessitated a very thorough study of temperature and pressure effects upon metals and considerable experiment. In addition the apparatus must deliver the required quantity to either one or two men at every altitude from 3,000 to 30,000 feet.

The first apparatus was designed for the British Air Service by Lieutenant Colonel Dryer of the British R. A. M. C. and was made at the plant of DeLestang at Paris. The demand for these apparatus was so great that an automobile was kept waiting at the plant for each apparatus as it was finished and was especially rushed to the front. An indication of the importance of oxygen is shown by the record of the 25th Squadron, 9th Wing, B. F. C. This was the first squadron to use oxygen equipment on planes in the British service. They were using the original Dreyer apparatus and found it efficient, sufficiently at least for Major Birley, who was in charge of the squadron, to state that this squadron in his opinion was giving six times the service of any other British squadron.

An original model of the French made apparatus was brought to this country to start quantity production. The French apparatus was a handmade device, each part being carefully fitted by an individual workman. Under the direction of Brigadier General T. C. Lystor, Medical Research Board of the Medical Section of the Department of Military Aeronautics, and the Bureau of Aircraft Production, the development and engineering of an oxygen apparatus to meet American requirements and to be adapted to American methods of manufacture was undertaken.

The entire apparatus had to be re-designed, first to take care of two men instead of one; second, to reduce the weight, and, third, to meet American methods of manufacture, and, fourth, to make the apparatus more efficient and reliable. This work was started about the first of January, 1918.

On May 3, 1918, six complete equipments, including apparatus, tanks, masks, etc., were sent overseas by special messenger to be actually tried out on the front. On May 31st the first production shipment of 200 apparatus was made. To date over 5,000 apparatus have been manufactured and accepted by the Government, over 3,600 have been shipped to ports of embarkation and over 2,300 have been floated overseas. This production, ranging from a rate of about 400 per month in May to 1,000 per month in October.

The importance of oxygen equipment necessitated the establishing overseas of a special oxygen equipment division to take care of the application of these equipments on planes.

All military planes flying over an altitude of 10,000 feet are equipped for the application of oxygen equipment. The following type of planes all use oxygen equipment: day bombing, pursuit and chase planes and a percentage of both night bombing and army and corps observation, this percentage depending on the altitude at which these types of planes will fly.

With victory looming in the eastern skies, be it remembered that

PARAGON PROPELLERS

built and based on efficiency, are with the winning forces. In the fight for democracy our product is Ace High. Four plants. Total floor space 164,132 ft.

Naval Aircraft Factory

(*Continued from page 667*)

engines, the Navy was able to select the type of aircraft which was best suited for its service and to frame a large and definite building program. As a result there are now over 500 seaplanes in use at naval air stations in the United States, and up to date over 400 seaplanes have been sent abroad. Other aircraft at stations, both in this country and abroad, includes airships and kite balloons. There has been no undue delay in supplying seaplanes, and the delivery of service seaplanes is approximately one month ahead of the scheduled time.

The demand for aircraft necessitated an enormous increase of production facilities, and, as a part of this extension, the Navy Department undertook to build and equip a naval aircraft factory at the Philadelphia Navy Yard. Within 90 days from the date the land had been assigned the factory was erected and the keel of the first flying boat was laid down. In August, 1918, the factory was producing 50 per cent more seaplanes than it had been two months previous. In addition, at least five plants are at present devoted to Navy work, and a large proportion of the output of several other factories has been assigned to the Navy.

The delivery of seaplanes for training purposes has been sufficient to more than meet the requirements. The training of personnel and providing of stations and equipment to carry out this training has expanded sufficiently so that the present output of pilots, observers, mechanicians, and men trained in special branches is keeping abreast or ahead of requirements.

The confidential nature of the work prevents any definite statement being made as to future operations. However, it may be said that the Navy Department recently established several air stations in Canada. These stations have been supplied with personnel and material from the United States, and the Navy Department is at present engaged in training personnel for the Canadian Government, which personnel will eventually take over the operation of the stations. In addition, the government of our allies have requested the Navy Department to take over more stations abroad, and not only are they desired to continue present operations, but also to increase the field of their activities.

From the Report of the Bureau of Steam Engineering

The marked military advantage to be gained by having but one type of aeroplane engine prompted the Navy Department to adopt the engine used by the Army. All Liberty engines used by the Navy are, therefore, obtained through the Aircraft Production Board.

About 1,500 of the engines have been delivered and have been assigned to naval air stations in this country and abroad. Since the number of Liberty engines produced has been too small for the needs of the Army alone, it has been necessary for the Navy to purchase others, to the number of about 700, which have been utilized while awaiting a full supply of Liberty engines.

In addition to these, a large number of engines of less power have been bought for use in training planes, all of which have been distributed to the flying schools, the most important of which is at Pensacola, Fla.

One of the very important duties devolving on the Bureau of Steam Engineering is the equipment and maintenance of stations for the generation of hydrogen for use in airships. A number of stations have been established and a full equipment of hydrogen cylinders provided, so that any calls may be promptly met.

It has also been necessary to give suitable training to a number of young officers for this work and to assign them to stations at home and abroad for the proper conduct of these plants.

From the Report of the Bureau of Construction and Repairs

The department has designed, built and equipped at the Navy Yard, Philadelphia, a factory for producing naval aircraft. This factory has been delivering planes since April of the present year. In January last it was decided to quadruple the capacity of the naval aircraft factory. The expansion is now nearing completion, and the present capacity of the aircraft factory is about fifty seaplanes of the largest size per month, and will, it is expected, eventually reach a capacity of ninety-five seaplanes of the largest size per month.

New Book on Practical Aeroplane Rigging

For Aviation Officers and Mechanics

Approved for use in U. S. Navy Aviation Mechanics Schools

Written by

JAMES T. KING, formerly mechanic with Canadian and American Curtiss Aeroplane Factory and Royal Flying Corps; now instructor Aviation Dept., Dunwoody Institute; and

NORVAL W. LESLIE, Flight Sub-Lieutenant, R.N., instructor Aviation Department, Dunwoody Institute.

This book is well illustrated and takes up types, parts, alignment, care and maintenance of machines in a practical way; also the theory of flight. Only new book of its kind on Rigging.

Price $1.50

PRECISION
BALL BEARINGS
(PATENTED)

Estimate the serviceability of a machine by the staying power of its weakest part—that it is which sets the limit of service. Analyze it for the essentials. Follow the factors in serviceability through every detail, to the small parts which—while seemingly insignificant—yet determine the capacity of the machine as a whole for maintaining its performance.

The bearings of the electrical accessories of airplane, car, truck, tractor, or power boat determine the service capacity of these machines. Which explains why "NORMA" Precision Bearings are the standard bearings in the ignition apparatus and lighting generators always preferred where maximum service is sought.

Be SURE. See that your electrical apparatus is "NORMA" equipped.

"STANDARD" Postal Planes Make Remarkable Record!

In the three months during which the fleet of special postal-planes, designed and built by the Standard Aircraft Corporation, has carried the air-mail between New York, Philadelphia and Washington, more than three hundred flights have been made and only seven of these have been interrupted for any reason whatsoever. Five of these interruptions resulted in negligible delays, and the other two held up the mail for only an hour or two.

This is a record for reliability of which the best train-service would be proud.

For peace-time duty as in war-time service, "STANDARD" Airplanes have proved their superiority.

AERO CLUB OF AMERICA OFFERS INTERCOLLEGIATE AERONAUTIC TROPHIES

ANOTHER important item has been added to the extensive plans of the Aero Club of America for fostering the use of aircraft for sport, pleasure, civic and scientific purposes.

Appreciating the fact that a large percentage of the 25,000 Army and Navy aviators are college men, including approximately 50% graduates and 50% undergraduates, and that most of them are intensely interested in aviation as a sport, the Board of Governors of the Aero Club of America has decided to create an Intercollegiate Aviation Trophy, to be competed for annually under rules similar to the rules governing the Intercollegiate regattas. The Board of Governors of the Aero Club of America is considering the advisability of creating two Intercollegiate Aviation Trophies, one to be competed for by graduates and one to be competed for by undergraduates.

The creation of the Intercollegiate Aviation Trophy is made possible under the bequest of the late Mr. Samuel H. Valentine, who was a member of the Board of Governors of the Aero Club of America, and who left $10,000.00 to the Club to be given in trophies or prizes for the development of Aviation.

This makes a total of 18 trophies and prizes for aeronautic events which are to be competed for during the coming year under the auspices of the Aero Club of America. Some of these trophies, like the International Aviation Trophy and the international Marine Flying Trophy, will be competed for in France, and the National Elimination Races will be held in the United States under the auspices of the Aero Club of America, to select the American representatives to be sent to France. The aeronautic trophies and prizes to be competed for during the coming year are listed in the Aero Blue Book, edited by Henry Woodhouse, and published by the Century Company, New York, as follows: For International Competition; The International Aviation Trophy; The International Balloon Trophy; The Michelin Trophy; The International Marine Aviation Trophy; The American Annual Aerial Derby; The Pan-American Aviation Trophy; The $50,000.00 and $5,000.00 Trans-Atlantic Flight Prizes. For National Competition: The Curtiss Marine Flying Trophy; The Annual National Elimination Aviation Contest; The Annual National Elimination Balloon Contest; The Mackay (Military) Aviation Trophy; The Valentine Trophies of the Aero Club of America; for Military and Naval Competition; The Collier Trophy; The Intercollegiate Aviation Trophies.

All these trophies and competitions are held under the rules of the International Aeronautic Federation, of which the Aero Club of America, No. 297 Madison Avenue, New York City, N. Y., is the sole representative on the American Continent.

Prospective entrants and competitors for these trophies will be required to hold the pilot's certificate which is issued by the Aero Club of America.

The competition for these trophies is expected to be the factor that will bring about the employment of aircraft for general purposes. It will also be the factor that will bring about the development of aircraft especially suited for civil purposes.

The arrangements for, and the rules and regulations governing the competitions for these trophies and prizes, which are not competed for under the international rules, will be made by the Contest Committee of the Aero Club of America, of which Mr. Alan R. Hawley is Chairman, and the following are members: W. Redmond Cross; Lieut. Godfrey L. Cabot, U. S. N.; Col. C. DeF. Chandler, U. S. A.; Major A. B. Lambert, U. S. A.; Major J. C. McCoy, U. S. A.; Commander H. C. Mustin, U. S. N.; Henry A. Wise Wood, and Henry Woodhouse.

AIRCRAFT APPROPRIATIONS AND AIRCRAFT CANCELLATIONS

THE sudden termination of the war has forced a policy of retrenchment in the Army and Navy aircraft programs and as the new policy is under consideration at present there is no definite military and naval aircraft program upon which the aeronautic industry can base plans for future activities.

Reports are received daily of cancellations of orders and the estimates for appropriations for the Army and Navy, which were included in the reports of the Secretary of War, Secretary of the Navy, and the Chiefs of the Bureaus of Military and Naval Aeronautics, have already suffered so many changes that it is impossible to state what the final estimates for appropriations will be.

The statement issued by the War Department recently announcing the adoption of a policy of Government construction, together with the fact that there are on hand a large number of military aeroplanes and motors, make it advisable for the aeronautic industry to seriously consider and adopt without delay a constructive policy of meeting the extensive demand for aircraft for commercial purposes, sport, pleasure and civic purposes.

This demand is large enough to afford substantial business but serious attention must be given to this field.

Air Service Estimates for 1920

As we have already stated there have been so many changes in the estimates for the air program of the Army and Navy that it is impossible to state what the appropriations will be. It is also impossible to state whether a large part of the appropriations requested is to meet present obligations and what part of the appropriations are to be spent for the upkeep of Government aircraft factories.

We print herewith the original estimates as a matter of record:

The letter from the Secretary of the Treasury to the House of Representatives,* of appropriations required for the fiscal year ending June 30, 1920, includes the following items for the Army Air Service:

*Transmitting the estimates.

Air Service, Aernonautics	$19,933,738.47
Air Service Production	$144,943,514.71
Total Air Service, Army	$164,877,253.18
Total Air Service, Navy	225,000,000.00

AIR SERVICE (AERONAUTICS)

AIR SERVICE, MILITARY—

Creating, maintaining, and operating at technical schools and colleges, and at established flying schools, courses of instruction for aviation students, including cost of construction, equipment and supplies necessary for instruction and subsistence of students, and excluding pay of military instructors and extra pay allowed candidates for commission (cadets) while at flying schools	$784,591.92
Extra pay allowed candidates for commission (cadets) while at flying schools	381,024.00
Vocational training in trades related to aviation, including the employment of necessary civilian instructors, purchase of tools, equipment, materials, machines, text books, books of reference, scientific and professional papers, and instruments and material for theoretical and practical instruction at aviation schools	325,669.20
Purchase of supplies for securing, developing, printing and reproducing photographs made by aerial observers	688,115.20
Purchase of aviation supplies and equipment to be furnished Air Service organizations to be established during the year, and to maintain and replace the equipment of organizations already in service	11,451,313.78
Payment of mileage to officers of the Army traveling on duty in connection with aviation	197,385.00
Establishment, enlargement, equipment, maintenance, and operation of aviation stations, balloon schools, fields for testing and experimental work	5,235,639.37
Salaries and wages of civilian employees in the District of Columbia or elsewhere as may be necessary, and payment of their traveling and other necessary expenses	600,000.00
Actual and necessary expenses of officers and enlisted men, and civilian employees of the Army, and authorized agents sent on special duty at home and abroad for aviation purposes, including observation and investigation of foreign military operations and organizations	25,000.00
Experimental investigation, and purchase and development of new types of aircraft	200,000.00
Necessary expenses incidental to the administration of the Air Service	30,000.00
All damages to persons and private property resulting from the operation of aircraft at home and abroad	15,000.00
Total amount to be appropriated under each head of appropriation: (aeronautic)	$19,933,738.47

PROVIDED, That claims not exceeding $250 in amount for damages to persons and private property, resulting from the operation of aircraft at home and abroad, may be settled out of the funds appropriated hereunder, when each claim is substantiated by a survey report of a board of officers appointed by the commanding officer of the nearest aviation post, and approved by the Director of Military Aeronautics;

PROVIDED, HOWEVER, That the claims so settled and paid from the sum hereby appropriated shall not exceed in the aggregate the sum of $150,000.

BUREAU OF AIRCRAFT PRODUCTION

AIR SERVICE (PRODUCTION)—

AERIAL APPLIANCES, VOCATIONAL TRAINING IN AVIATION, ETC.: For the purchase, manufacture, repair, and operation of airships, war balloons, and other aerial machines, including instruments and appliances of every sort and description necessary for the operation, construction, or equipment of all types of aircraft, and all necessary spare parts and equipment connected therewith; and all necessary buildings for equipment and personnel in any bureau or department charged with the production or procurement of aeronautical equipment and material; and also for the establishment, enlargement, equipment, maintenance, and operation of fields for testing and experimental work, including (a) the acquisition of land, or any interest in land, with any buildings and improvements thereon, by purchase, lease, donation, condemnation, or otherwise.

Total (Production) $144,943,514.71.

CONTINUING THE APPROPRIATIONS FOR THE SIGNAL SERVICE: That funds appropriated by the act approved July 24, 1917, for the fiscal year 1918, entitled "At act to authorize the President to increase temporarily the Signal Corps of the Army and to purchase, maintain, manufacture, repair, and operate airships, and make appropriations therefor, and for other purposes," and the funds appropriated for the Signal Service of the Army in the act approved May 12, 1917, entitled "An act making appropriations for the support of the Army for the fiscal year 1918," and October 6, 1917, for the fiscal year 1918, and prior years, entitled "An act making appropriations to supply urgent deficiencies, etc.," are hereby made available until June 30, 1920.

APPROPRIATION IMMEDIATELY AVAILABLE: That the moneys appropriated in this act for aviation purposes shall be and become available upon the passage of this act, and all shall also be available for the payment of obligations incurred prior to the passing of this act. In the event such obligations are of a character otherwise within the scope of the appropriation.

PROVIDED, That there shall be allotted to the Aircraft Board, by the head of the Bureau or Department charged with the production of aircraft, from the appropriations herein made for aircraft production for the fiscal year 1919 and 1920, the sum of $100,000.00, or so much thereof as may be necessary, which money shall be available during the fiscal year for the payment of such clerks, or other employees, either in the District of Columbia, or elsewhere, as may be necessary for the conduct of its business, including such technical experts and advisors as may be found necessary; and for the payment of rental of offices in the District of Columbia or elsewhere, purchase of necessary office equipment and supplies, including scientific publications, printing, necessary administration, and contingent expenses of said board.

AVIATION, NAVY—

For aviation, to be expended under the direction of the Secretary of the Navy for procuring, producing, operating, preserving, storing, and handling aircraft, establishment and maintenance of aircraft stations, including the acquisition of land by purchase, donation or condemnation, and for experimental work in development of aviation for naval purposes ($220,383,119)	$225,000,000.00
PROVIDED, That the sum to be paid out of this appropriation under the direction of the Secretary of the Navy for drafting, clerical, inspection, and messenger service for aircraft stations shall not exceed $300,000: PROVIDED Further, that the Secretary of the Navy is hereby authorized to consider, ascertain, adjust, determine and pay out of this appropriation the amounts due on claims for damages which have occurred or may occur to private property growing out of the operations of naval aircraft.	
Navy Total	$225,000,000.00

SECRETARY BAKER'S REPORT

IN his annual report for 1918, released December 5th, the Secretary of War reported on the Air Service as follows:

AIR SERVICE

Organization

The Aviation Section of the Signal Corps, which had charge of the production and operation of military aircraft at the outbreak of the war, was created on July 18, 1914. To assist in outlining America's aviation program, the Aircraft Production Board was appointed by the Council of National Defense in May, 1917. In October, 1917, the Aircraft Board, acting in an advisory capacity to the Signal Corps and the Navy, was created by act of Congress. In April, 1918, the Aviation Section of the Signal Corps was separated into two distinct departments, Mr. John D. Ryan being placed in charge of aircraft production and Brig.-Gen. W. L. Kenly in charge of military aeronautics. Under the powers granted in the Overman Bill, a further reorganization was effected by Presidential order in May, 1918, whereby aircraft production and military aeronautics were completely divorced from the Signal Corps and established in separate bureaus. This arrangement continued until August, when the present air service, under Mr. Ryan as Second Assistant Secretary of War, was established, combining under one head the administration of aviation personnel and equipment.

Raw Materials Secured

One of the most important problems which confronted the aircraft organization from the start was the obtaining of sufficient spruce and fir for ourselves and our allies. To facilitate the work, battalions were organized under military discipline and placed in the forests of the western coast. A government plant and kiln were erected to cut and dry lumber before shipment, thus saving valuable freight space. To November 11, 1918, the date the armistice was signed, the total quantity of spruce and fir shipped amounted to approximately 174,000,000 feet, of which more than two-thirds went to the Allies.

The shortage of linen stimulated the search for a substitute possessing the qualities necessary in fabric used for covering aeroplane wings. Extensive experiments were made with a cotton product which proved so successful that it is now used for all types of training and service planes.

To meet the extensive demands for a high-grade lubricating oil, castor beans were imported from India and a large acreage planted in this country. Meanwhile research work with mineral oils was carried on intensively, with the result that a lubricant was developed which proved satisfactory in practically every type of aeroplane motor, except the rotary motor, in which castor oil is still preferred.

Production of Training Planes and Engines

When war was declared the United States possessed less than 300 training planes, all of interior types. Deliveries of improved models were begun as early as June, 1917. Up to November 11, 1918, over 5,300 had been produced, including 1,600 of a type which was temporarily abandoned on account of unsatisfactory engines.

Planes for advanced training purposes were produced in quantity early in 1918; up to the signing of the armistice about 2,500 were delivered. Approximately the same number was purchased overseas for training the units with the Expeditionary Force.

Several new models, to be used for training pursuit pilots, are under development.

Within three months after the declaration of war extensive orders were placed for two types of elementary training engines. Quantity production was reached within a short time. In all about 10,500 have been delivered, sufficient to constitute a satisfactory reserve for some time to come.

Of the advanced training engines, the three important models were of foreign design, and the success achieved in securing quantity production is a gratifying commentary on the manufacturing ability of this country. The total production up to November 11 was approximately 5,200.

Production of Service Planes

The experience acquired during the operations on the Mexican border demonstrated the unsuitability of the planes then used by the American Army. Shortly after the declaration of war, a commisison was sent abroad to select types of foreign service planes to be put into production in this country. We were confronted with the necessity of redesigning these models to take the Liberty motor, as foreign engine production was insufficient to meet the great demands of the Allies. The first successful type of plane to come into quantity production was a modification of the British De Haviland 4—an observation and day bombing plane. The first deliveries were made in February, 1918. In May, production began to increase rapidly, and by October a monthly output of 1,200 had been reached. Approximately 1,900 were shipped to the Expeditionary Force prior to the termination of hostilities.

The Handley Page night bomber, used extensively by the British, was redesigned to take two Liberty motors. Parts for approximately 100 planes have been shipped to England for assembly.

Table 20 shows the status of American production of service planes by quarterly periods.

Table 20.—Service planes produced in the United States in 1918:

Name of plane	Jan. 1 to Mar. 31	Apr. 1 to June 30	July 1 to Sept. 30	Oct. 1 to Nov. 8	Total
De Haviland 4	14	515	1,165	1,493	3,187
Handley Page	..	...	100	1	101

(Continued on page 722)

THE NEWS OF THE WEEK

Wilson Pardons Aircraft Officials

Washington.—President Wilson December 3d authorized the announcement that he had pardoned Lieut.-Cols. George W. Mixter and J. G. Vincent, whom the recent report submitted by Charles E. Hughes, after his investigation of aircraft production, declared to be guilty of violation of a section of the criminal code which prohibits any person interested in profits or contracts of a corporation from acting as an officer or agent of the Government for the transaction of business with that corporation.

Attorney General Gregory agreed with Mr. Hughes's conclusion that these two officers had violated this section of the code, but did not think the ends of justice required that either of the two officers be prosecuted. At the White House it was announced that the President had pardoned both officers because he concurred entirely in the views of the Attorney General.

"He (the President) believes," says the official announcement, "that the two gentlemen concerned were entirely innocent of any improper or selfish intention, that their guilt was only technical, and that their service to the Government, which has been of the highest value and of a most disinterested sort, deserves the most cordial recognition."

No further statement was authorized by the President, but the letters written by the Attorney General were made public. Mr. Gregory's letter dealing with the case of Lieut.-Col. Vincent follows:

Dec. 3, 1918.

To the President,
The White House.
My Dear Mr. President:

In the report submitted to me by the Hon. Charles E. Hughes at the conclusion of the aircraft investigation, Lieut.-Col. J. P. Vincent was one of three officers found to have transacted business for the Government contrary to the prohibition contained in Section 41 of the Criminal Code and against whom prosecutions were recommended. In transmitting the report to you I said:

"I agree with Judge Hughes's conclusion that Lieut.-Col. Vincent violated Section 41 of the Criminal Code, which prohibits any person, directly or indirectly interested in the pecuniary profits or contracts of a corporation, from acting as an officer or agent of the United States for the transaction of business with such corporation. I further agree with Judge Hughes that the evidence does not afford ground for the conclusion that the Government was defrauded, or that there was any intent to defraud on the part of any of the parties concerned, or that the services rendered were not worth the amount paid therefor, or that the estimates of the outlay of the Packard Company were not fair estimates."

While there was a violation of the statute, I do not think the ends of justice require that Colonel Vincent be prosecuted.

Colonel Vincent was one of the designers of the Liberty motor. At that time he was not in the employ of the Government, but was vice-president of the Packard Motor Car Company. When the motor had been designed the Packard Company tendered Mr. Vincent and its engineering staff any facilities for such advice as might be necessary to test out and develop the design for production. The authorities authorized Mr. Vincent to build the required number of models and experimental motors, and he directed his company to do the work under his supervision. Later, during the progress of the work, he was commissioned in the Signal Corps, resigning as an officer of the Packard Company, but retaining the ownership of his stock. His offense is that he acted for the Government in connection with settling the compensation to be paid the Packard Company for this work. There is no evidence that he did not act in entire good faith, or that any advantage was taken of the Government.

The production of the Liberty motor was one of the great achievements in connection with the war. Colonel Vincent rendered invaluable services in designing and perfecting it.

In view of all the circumstances I recommend that a full and complete pardon be granted for the offense, as I believe it was unwittingly committed.

Respectfully,
T. W. GREGORY,
Attorney General.

The text of the other letter is as follows:

Dec. 3, 1918.

To the President,
The White House.
My Dear Mr. President:

The report made by the Hon. Charles E. Hughes to me at the conclusion of the aircraft investigation shows that Lieut.-Col. George W. Mixter acted for the Government in supervising inspection and production at the Curtis Aeroplane and Motor Corporation while he owned twenty-five shares of the preferred stock of that company of the par value of $2,500. I concurred with Judge Hughes in his conclusion that this was a violation of Section 41 of the Criminal Code.

Lt. William T. Campbell, O.I.C. Flying, Love Field, Dallas, who made the world's looping record by looping 151 times in succession

Lieut.-Col. Mixter testified that he had formerly owned a small amount of both common and preferred stock in the company referred to; that at the time he was commissioned he had sold the common stock and overlooked the fact that he still owned the preferred. There is nothing in the evidence warranting the conclusion that Lieut.-Col. Mixter did not act in entire good faith in the transaction referred to, or indicating that he was influenced by his ownership of this preferred stock, which paid a fixed dividend.

Lieut.-Col. Mixter has performed efficient service for the Government, and at a substantial sacrifice. I believe that the offense was unwittingly committed, and recommend that he be granted a pardon.

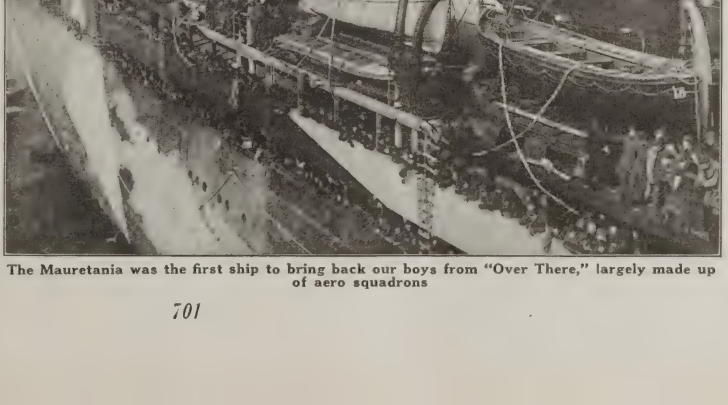
Respectfully,
T. W. GREGORY,
Attorney General.

Giant Seaplane to Make Radio Tests

Radio tests are to be made daily at the Naval Air Station at Anacostia, near Washington, a giant seaplane equipped with one of the finest wireless outfits in the navy having been assigned to the station especially for experimental work. This plane, which is the largest yet assigned the Washington base, arrived yesterday after a successful flight from Hampton Roads.

The plane has a capacity of eight passengers besides the crew of two, and is equipped with bombing and anti-aircraft appliances. The experimental flights will be carried on until freezing of the river.

Cited for Bravery



First Lieutenant George R. Phillips of the 50th Aero Squadron, who lives at Lewiston, Pa., and his observer, Second Lieutenant Mitchell H. Brown of Rockwell, Tex., attacked an enemy balloon while on reconnaissance and forced it to descend. They were in turn attacked by three Fokker planes, and incendiary bullets from the enemy machines set the signal rockets in the observer's cockpit afire. "Disregarding the possibility of going down in flames, Lieutenant Phillips manoeuvred his plane so that his observer was able to fire on and destroy one enemy plane and drive the other away.

"He then handed his fire extinguisher to his observer, who extinguished the flames. They completed their mission."

Flies 175 Miles in 75 Minutes

Washington.—Despite heavy snowstorms over the Alleghany Mountains, which forced an ascent to 12,000 feet, the trip from Pittsburgh to Washington, a distance of 175 miles, was made in seventy-five minutes Dec. 6 by a Glenn Martin day bombing plane equipped with twin Liberty motors and piloted by Major Harley W. Lake, inspector for the Division of Military Aeronautics.

Major Lake, a mechanician, and another pilot left Cleveland Dec. 5, but were forced to descend near Pittsburgh for the night. Temperatures as low as 10 degrees below zero were encountered during the flight.

The Mauretania was the first ship to bring back our boys from "Over There," largely made up of aero squadrons

Five Planes Crossing Country

Washington.—Major Albert D. Smith, commanding a squadron of five army aeroplanes which left San Diego Wednesday for El Paso, received authority Dec. 6 from the War Department to continue the trip to the Atlantic seaboard if possible.

If the transcontinental flight is made it will be the first by a military aircraft formation.

After leaving El Paso it is expected that the planes will stop at Kelly Field, San Antonio, Texas; Ellington Field, Houston, Texas; Camp Taylor, Montgomery, Alabama; Souther Field, Americus, Georgia; Dorr Field, Arcadia, Florida, thus completing the flight from the Pacific to the Atlantic.

Germany Preparing for Next Air War

According to the correspondence of the Associated Press, in Germany there is a society called the "Deutsche Fliegerbund." Just as the German Navy League was largely influential in giving Germany a powerful navy, so this new flying league, it is believed here, is expected to promote the German aim in "the next war" of conquering the world from the air.

According to a Bremen paper, the league will undertake the preliminary work in the training of young men for the air service. Flying schools are to be established for the "practical and theoretical" instruction of boys from 15 to 18 years old.

The training will be carried out, the paper says, by means of model aeroplanes. The monthly fee will be one mark, about 25 cents. "Practical training, four marks a year," the announcement reads.

French Aces to Foster Aerial Sports

French military aviators are planning the organization of an association to foster aerial sports and to place competent pilots at the service of the government and industry and business. The association will include the leading French aviators and will have the support of the government. Numerous aces already have signified their intention of joining.

Pittsburgh to Washington in 95 Minutes

Washington—Capt. Norbert Carolin made a flight in an army aeroplane from Pittsburgh to Washington, December 3, in one hour and thirty-five minutes. War Department officials said the best previous record was two hours and twenty minutes.

More Aero Squadrons Returning

Washington.—Two steamships, the "Empress of Britain" and the "Adriatic," sailed from Liverpool December 2 for New York with American troops, the War Department announced. The "Empress of Britain" carries 76 officers, 10 nurses and 2,389 men. The "Adriatic" carries 80 officers and 2,208 men.

Aboard the "Empress of Britain" are the 307th, 361st, 140th, 337th, 256th and 834th aero squadrons; the Tenth, Thirteenth, Seventeenth and Fourteenth air service construction companies, and a number of casuals and sick and wounded.

The "Adriatic" carries the 828th, 338th, 336th, 334th, 472d, 377th and the 637th aero squadrons; the Fourth, Sixth, Seventh, Eighth and Ninth air service construction companies.

Air Service Clubs' Association

The total embership of the Air Service Clubs' Association is now very near the thousand mark, with membership campaigns being conducted in almost every field. At Kelly Field, Texas, a meeting of the officers was recently held at which plans were made to enroll members in the Association.

Returning aviators from France in almost every case are joining the Air Service Clubs' Association. Applications are also being received from men in the Naval Branch of Aviation. The Balloon Section has also responded in a gratifying manner.

Kenly Flies from Washington to Garden City

Major General Wm. L. Kenly, Director of the Division of Military Aeronautics, with Major Wm. C. Ocker, Air Service, Aeronautics, as pilot, made the air trip from Washington to New York City, on November 29, in one hour and fifty-five minutes flying time. They left Bolling Field at 10:20 A. M. in a de Haviland plane and arrived at Garden City, N. Y., at 12:15 P. M.

Wilbur Wright Demobilizing

Demobilization at the Wilbur Wright field will begin within the next few days it is unofficially announced, and it is expected it will require about two months to muster out of service the more than one thousand men stationed at the Armorers' school. Lieut. W. G. Marvin, acting commanding officer at the field; Lieut. Lockwood, assistant technical executive, and Capt. B. A. Milter, gunnery officer, will return to private life this week. Col. B. Q. Jones, commanding officer at the field, was in Washington this week getting information concerning demobilization. Col. T. H. Bane, of the M'Cook Field, is also in Washington.

Information Bureau Ends Domestic Duty

The Committee on Public Information, of which George Creel was the head, has gone out of existence so far as the domestic service is concerned.

There will be no diminution, however, in the public supply of government news. The only difference will be in the system. Hereafter the news of the governmental operations will be disseminated by the publicity bureau of each department separately.

Reserve Officers to Have Annual Flight Instruction

The War Department authorizes the following:

Officers of the Air Service, Aeronautics, who remain in the Reserve Corps following their discharge from the regular service, will be permitted to fly Army planes even after their release from active duty. This information is of special interest to the Army pilots now leaving the service, as most of them had expected that they would have to give up flying or buy a plane. Although something like air livery planes are foreseen in the near future, the present cost of a plane is equal to the price of the most expensive English or French automobile, a price prohibitive to most flyers, and even though an expert pilot might be able to arrange for a "jazz" flight in some ship capable of fifty or sixty miles an hour, if he had been accustomed to flying planes doing from 90 to 135 miles an hour, it would be tame sport for him and of little attraction.

According to present plans, reserve officers of the Air Service, Military Aeronautics, will be called to flying fields for active duty for a period not to exceed two weeks each year. There pilots who have not flown for some time would be sent up, first, under an instructor in order to demonstrate their ability to handle a ship. After the dual control flight they would be permitted to fly solo during their period of training service. In the event of another emergency, these flyers would immediately be taken into the service again as commissioned officers without further training or instruction.

Splitdorf Activity in the War

An echo of Splitdorf activity in the War—the Splitdorf of ignition renown in the aeroplane automobile, truck, motorcycle, tractor and motorboat field—was sounded recently. A. B. Chace, factory manager of the Splitdorf Electrical Company's home plant at Newark, N. J., recently received a letter from Arthur J. Fleidner, one of the many Splitdorf workmen serving with the American Expeditionary Forces in France. Fleidner, who was one of the first to be included in the overseas contingent, in the course of an interesting letter and commenting upon the fact that even the Huns knew a good thing when they saw it, writes:

"Well, the Splitdorf Dixie 441 and the rest of the Dixies are standing right up at the front, as they are on all Packard trucks and Indian motorcycles. We have had no trouble with them and I hope that they put them on all machines after this.

"I have a piece of a breaker bar from a Splitdorf Magneto which was on a 'Hun' aeroplane which was brought down right near where we were stationed. We boys are giving the 'Hun' all they want, and it won't be long now when everything will be over."

First Forecast Made on Aerial Weather

Washington.—The first aerial weather forecast to be issued in the United States was made public Dec. 3 by the Weather Bureau in co-operation with the aerial mail service of the Post Office Department. It is as follows:

New York to Cleveland, cloudy, 8 P. M. Snow near Lake Erie. Winds moderate northwest to north northwest east of the Alleghanies up to 6,500 feet and moderate south winds west of Alleghanies, shifting to west southwest at about 1,500 feet. Forecast, snow to-day, Monday, with increasing northeast to north winds up to about 6,000 feet, backing to strong northwest above.

It is the purpose to extend this forecast for all the territory from New York to Chicago by December 15, when the aerial mail service between those and intermediate cities is to be inaugurated.

Long Island Flying School Reopens

The Hydrerocraft Co. has reopened its flying school at Central Park, L. I. Due to war conditions, the work at the school was temporarily suspended, but as its popularity had long been established, a lively resumption of peace-time flying activity is contemplated.

From New York City, the flying field at Central Park is easily reached by train from Jamaica, or by automobile by way of Hempstead. Classes are being formed for solo instruction on the Curtiss JN 4 tractor, and passenger flights can be arranged by appointment.

Balloon Section Congratulated

The Balloon Section is being congratulated as a result of the publication of the following orders:

Headquarters First Division,
American Expeditionary Forces,
France, October 12, 1918.

From: Chief of Staff, 1st Division
To: Commanding Officer, 2nd Balloon Company
Subject: Appreciation of Services

1. The Commanding General, 1st Division, directs me to express to you his appreciation and the appreciation of the division for the services rendered by your organization during the operations participated in by this division between the Meuse and the Argonne from September 29 to October 11, inclusive. The energy and alertness of your organization, which enabled the frequent identification of artillery targets, were of great value to the division.

J. H. Greely,
Chief of Staff.

Balloon Group
Fifth Army Corps, A. E. F.
A. P. O. 769
19 October, 1918.

Group Special Order No. 26.

1. The entire Balloon Service honors the maneuvering squad of the 12th Balloon Company. The devotion to duty shown by the men who composed this squad on October 1, 1918, was such as to set a glowing example to all other balloon companies in the American Expeditionary Forces.

2. Despite the fact that shells were falling on all sides of the balloon, two so close as to tear holes in the fabric, no man left the ropes nor faltered, well knowing that death was liable to come to them at any moment. The safety of the balloon was their first thought; their personal safety second. They have shown the spirit and loyalty which is expected of true soldiers.

3. This order is to be read to all balloon organizations, in the Balloon Group, Fifth Army Corps, at the first formation after its receipt.

By order of Major Jouett:
Carleton C. Jones,
1st Lieut., A. S., U. S. A.
Adjutant.

The Aviation Section of the N. Y. Police Department in a recent parade

The AIRCRAFT TRADE REVIEW

Col. Vincent to Remain on Job Until Jan. 1st

Col. J. G. Vincent, who has been commandant at the M'Cook Experimental Field here, and resigned, will remain at his post until January 1, giving his successor, Col. T. H. Bane, all the help he can in this work. Col. Vincent returns Jan. 1 to Detroit to resume his work as vice president of the Packard Motor Co.

Personal Notes

C. A. Shayne, formerly student at the Massachusetts Institute of Technology, Cambridge, is now junior mechanical engineer with the Nation Advisory Committee for Aeronautics, Washington, D. C.

R. B. Jones, formerly superintendent of engineering shops, Curtiss Aeroplane & Motor Corp., Buffalo, is now production engineer of the Canadian Aeroplanes, Ltd.

Frank M. Taylor, formerly purchasing agent in The Glenn L. Martin Co., Cleveland, is now director of purchases for The Parish & Bingham Co., that city.

John Swinscoe, formerly chief engineer with Crown Cork & Seal Co., Baltimore, Md., is now industrial engineer in the Wright-Martin Aircraft Corp., New Brunswick, N. J.

Austin P. Palmer, formerly electrical consulting engineer in New York City, is now electrical tester with the Sperry Gyroscope Co. of Brooklyn, N. Y.

G. H. Peterson, formerly designing engineer of the Champion Ignition Co., Flint, Mich., is no longer connected with that company.

Fort Omaha Balloon Pilots Continue in Experiment Flights

Leo Stevens, Lt.-Col. J. D. Carmedy and Capt. Raymond C. Pierce made a free balloon flight from Fort Omaha for experimental purposes and the balloon used has a capacity for 35,000 cubic feet of gas.

The flyers are all master balloonists and, it is safe to say, that three more experienced and daring aeronauts never before made a flight together.

Leo Stevens holds all honors as the foremost balloon pilot in the country. He has made ballooning his business since he was a mere lad and most of the great fliers of today were trained under Stevens. He has made several thousand flights and many hundred parachute drops.

Captain Pierce has given ballooning devoted study and has invented a machine attachment for the distributing of literature to be dropped during flights.

American-British Gage Bureau

Major H. W. Torney, U. S. A., and Mr. H. J. Bingham Powell, of England, have charge of the U. S. Bureau of Aircraft Production Section of Gages and Standards, and the Gage Inspection Department of the British War Mission, located in New York City. This highly important and very advanced combined organization is installed at 45th Street and Madison Avenue. Here gages are designed, purchased and inspected.

All new gages are sent to this bureau, inspected and returned to the particular districts in which they are used. Formerly district officers had discretionary power to use in certain classes of work gages rejected for given specific purposes, but this practice has been discontinued; once a gage is rejected, that is the end of it.

Visits are made to the war products plants fortnightly to examine for wear the gages in uses there. The history of each gage is recorded in books at the respective factories, the inspectors noting down the result of each periodical examination of them. The use of any gage is discontinued after it develops an amount of wear that has been predetermined.

The United States Army has received greatly appreciated assistance from the British in the establishment and operation of this branch of its inspection work. Nearly one hundred persons are employed in the laboratory at this time. There is an adequate drafting room for the design of the gages. The basic purpose of the bureau is to aid manufacturers in production and facilitate their meeting the gages in their work. That is, the activity is gage procedure in the broad sense, much of this practice being based on reports of the National Physical Laboratory of London. Clear instruction in the use of gages is given. A branch is maintained in Detroit.

Conflict of Thread Standards

The matter of the international conflict of thread pitches is of course before the bureau much of the time. This is one of the subjects that was considered in a preliminary way at the conference of American and British engineers held early in the year in London in cooperation with the work of the British Engineering Standards Association for the determination and promulgation of mechanical standards for the British Government.

The British representatives here feel that if a series of screw or bolt pitches could be agreed upon by Great Britain and this country, the rest of the points in connection with thread practice that would have to be solved would be easy of disposition. For example, the difference in the specifications for the Whitworth and for the United States forms of thread is not considered formidable. In other words, they are of the opinion that in practctice the United States form of thread is produced rounded in a way approaching that specified in the Whitworth standard. The view has been expressd that the five-degree difference in the angle of the British and of the United States thread is not an insurmountable obstacle to Anglo-American standardization. U. S. nuts have been assembled on Whitworth screws without great "over-wrenching" in the great majority of cases in recent trials made.

There is a strong tendency in England to replace the Whitworth pitches by the British standard fine pitches. These latter run numerically about half-way between those of the United States standard and of the S. A. E. Standard Regular. Some of the British engineers make the statement that the British standard fine pitches will answer the needs of all engineering practice. They are anxious that an Anglo-American standard of pitches shall be established.

The British Association threads are dimensioned in the metric system. This system, which originated in Switzerland, runs up to a little over ¼ in. diameter, and is used in instrument making.

Gage Inspection

In the American-British laboratory here women are employed extensively. They are found to be good on automatic work. In some of the gage testing machines, a system of wires under weight tension is used, electric visual signals flashing out when a given dimension on a gage is as it should be. Generally speaking, each dimension is measured by a separate person. The establishment is equipped with gage blocks accurate within a few ten-thousandths of an inch. Measurements to two hundred-thousandths are made.

The gage tolerances are usually in amount one-tenth those of the product.

In the case of a complicated gage, like that for an oil-pump, two days are needed for inspection.

The lantern screen system of magnified measurement is used, photographic views of gages thrown on the screen being made. The merit of the work depends, of course, upon the field accuracy of the lens used. Photometric gages will replace steel gages to some extent.

A study is being made of the polarized light method of indicating distribution of stresses, in celluloid pieces cut to shape. It is known in a general way that in the case of threads the stresses are applied on the first few threads only, the most stress being imposed on the first. From this it is deduced that there is no advantage in long threads, unless differentiated threads are used on bolt and nut, the latter being pulled up by a wrench.

To Sell Army Aeroplanes

A campaign has been inaugurated to sell in open marked, with the approval of the Chief of the Supply Section, several hundred aeroplanes and engines, which served their purpose well as training ships for our aviators and which are no longer needed. These aeroplanes, it is believed, will find a ready sale in open market and will do much to popularize flying in the United States. Another possible market for some of these aeroplanes is to nations of South America.

Major Packard Resigns

The resignation of Major John H. Packard as Officer in Charge of the Aeronautical Information Branch was announced this week. Major Packard returns to his home in Philadelphia to resume his business. Major Packard was presented with a monogrammed gold and silver cigarette case by the civilian and military members of the Information Branch.

The Aeroplane as a Possible Bootlegger Thwarted

Pensacola.—Aeroplanes have been added to the means by which liquor may not be brought into the State of Florida.

The bill to which Senator John Stokes gave his name and which he prides himself on having made "the most drastic anti-liquor law ever framed in the history of the world" has been amended to include "all machines traveling through the air" among those vehicles which may be forfeited and disposed of for aiding bootlegging.

Hundreds of aviators fly regularly from half a dozen places in Florida to New Orleans or to coast points where illicit stills are in operation. Gov. Sidney Catts had been told that liquor was brought back on their planes by these men.

Postmaster Burleson Reports Plans for Aero Mail

In the course of his annual report Postmaster Burleson goes into much detail as to the use of aeroplanes. On this it says:

Cost of Air Service

"One round trip daily, except Sunday, by postal aeroplanes carrying mail is being made without fail. The trip from Washington to New York is performed on an average of two hours and thirty minutes, and from New York to Washington in two hours and fifty minutes, the difference in time being due to resistance offered by the prevailing winds, which are usually from a westerly direction. An average of seven and one-quarter tons of letter mail is being carried each month. The cost of the operation of the service since it began, including development of new routes, is at the rate of $108,223.41 per year, or 79 cents per mile operated. The cost per ton mile of mail carried is $5.35. By this service mail between New York and Washington is advanced from two and one-half to three hours over the train service.

"The Washington-New York route has served as a working laboratory in which the many unknown factors that enter into the maintenance of a daily aerial service are being successfully solved, and the Post Office Department only awaits the day when the aircraft production of this country can more than supply the needs of our own army and those of our allies to make effective the programme for the aerial mail that I have directed to be put into operation as speedily as war conditions will permit.

"This programme directs, first, the establishment of an aerial mail service connecting the principal commercial centres of the country by a system of trunk lines and feeders, and, secondly, connecting this country with the West Indies and Central and South America. The trunk lines and feeders decided upon under this programme are:

"1. New York to San Francisco, with feeders from (a) Chicago to St. Louis and Kansas City; (b) Chicago to St. Paul and Minneapolis; (c) Cleveland to Pittsburgh.

"2. Boston to Key West, with feeders from (a) Philadelphia to Pittsburgh; (b) Washington to Cincinnati; (c) Atlanta to New Orleans.

"3. Key West, via Havana, to Panama.

"4. Key West, via the West Indies, to South America.

"On this programme I have to report progress as follows:

"1. Boston to Key West.—Of this route the Washington-New York division has been operated since May 15, and is functioning perfectly.

"The Boston-New York division has been tentatively laid out and will be established whenever, in the opinion of the War Department, its operation will not conflict with the war needs of the country.

"The Washington-Atlanta and Atlanta-Key West routes are now being worked out with a view to their immediate establishment at the close of the war.

"2. New York to San Francisco.—Of this route the division from New York to Chicago has been carefully worked out. The War Department has released to the Post Office Department, for the use of this division, aeroplanes of 650 pounds mail-carrying capacity which are no longer suitable for war needs. The hangars have been ordered, landing fields obtained, and the route has been ordered established before the close of the present year.

"In a series of aeroplane flights by the Post Office Department early in September the route was carefully charted for emergency and regular landing fields. In this work one aeroplane made a record flight from Chicago to New York in less than fourteen hours, including all stops en route. The flights were made through storm and heavy rains over parts of the route. The reconnaissance developed that it will be feasible to maintain a daily nine-hour schedule between New York and Chicago, as compared with the twenty-one-hour schedule of the Twentieth Century Limited.

"The time between Chicago and Cleveland will be cut to three hours forty-five minutes, and between New York and Cleveland to five hours fifteen minutes. Mail from the Atlantic seaboard will be advanced from twelve to twenty-four hours to the West and Southwest by this new service. The feeder routes from Chicago to St. Louis, Kansas City, St. Paul, Minneapolis, and the remainder of the trunk line from Chicago to San Francisco will be worked out during the ensuing year with a view to their immediate inauguration at the close of the war.

"3. Key West to Panama, and 4. Key West to the West Indies and South America.—Negotiations looking to the conclusion of special aerial mail conventions between the United States and the foreign countries involved for the establishment of these routes to the West Indies and Central and South America are now in progress. It is realized that these oversea routes will require the most powerful aeroplanes with wireless installation and special construction to make them safe over the seas, but the enormous commercial advantage that will result by materially reducing the time between this country and Central and South America will justify the expenditure that such a service will entail."

The Thanksgiving luncheon party in the cockpit of the Handley Page Biplane that will shortly be in active aerial mail service

One Hundred and Twelve Additional Aeroplanes for Mail Service

The War Department has turned over to the Post Office Department 100 De Haviland No. 4, and 12 Handley-Page aeroplanes, in compliance with the provision of the 1919 appropriation bill, to be put in operation in the Air Mail Service. The De Haviland fours will carry 400 pounds of mail and may be altered so as to increase the capacity to 1200 pounds. The 12 Handley-Page are large bombing planes capable of carrying a ton or more.

The New York-Chicago air route will be divided into three legs. Starting from Elizabeth, N. J., the first regular stop will be Bellefont, Pa., with emergency landing field at Lehighton, Pa.; the next regular stop will be at Cleveland, Ohio, with an emergency landing place at Clarion, Pa.; and the final leg from Cleveland to Chicago with a stop at Bryan, Ohio, to take on and discharge mail. Three planes will be used between New York and Chicago, one for each leg of the trip.

The Post Office Department has just employed ten additional regular pilots and four emergency pilots, which, with the four regular fliers now on the New York-Washington route, make a total force of 19 pilots.

(*Continued on page 731*)

MILITARY AEROSTATICS

By LIEUT. H. K. BLACK, R. F. C., C. F. A.

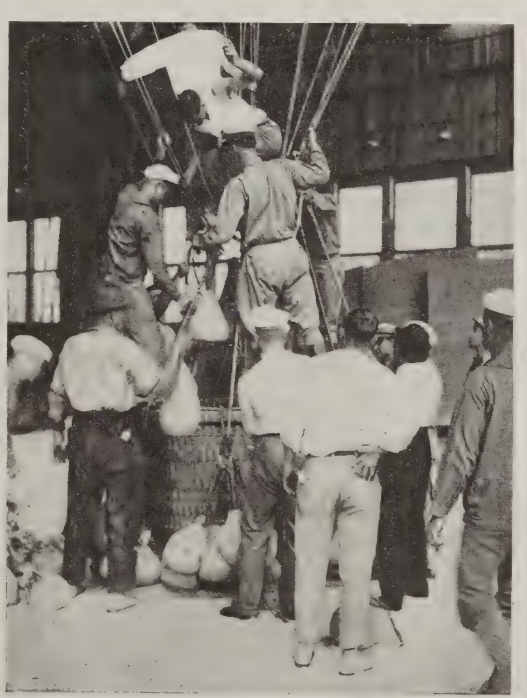
Free Ballooning

THOUGH a captive observation balloon does not go floating at the dictates of the wind over the lines, there are times when such a thing might happen. Balloons break away from their cables in a high wind sometimes and then a captive balloon becomes, to all intents and purposes, a free balloon. If the wind is carrying the balloon toward the Hun lines there is only one thing to do. The observer must throw his instruments overboard and then follow them to earth in his parachute.

The balloon generally goes over the Hun lines hotly pursued by the anti-aircraft shells of both the Germans and our own batteries.

If, however, the wind is away from the Hun lines the balloon will drift back into friendly territory. In that case it is necessary that the pilot of the balloon be able to bring his balloon down to earth without injury to himself, his passenger or the gas bag itself. Therefore is the need of free balloon training as a preliminary for observation balloon work. This necessity has been questioned several times since war broke out, and as an instance of the non-necessity of it the fact was quoted that the French didn't use it. The prevailing winds in France are toward the Hun lines, so while the French did not do the free ballooning, they were making a virtue of necessity in refraining from it. Had they done so, the chances are they would have lost a good many balloonists by them drifting over the Hun lines. This would be particularly the case in long night flights. It was notorious throughout the British balloon wings that the French were having very high casualties among their balloon observers on account of the lack of free balloon training. This training does more, however, than teach the pilot how to bring his balloon to earth safely; it teaches him the very indescribable thing known as the "feel of the air." In other words, it gives the balloonist a great deal of confidence in himself, his balloon and his ability.

Free ballooning as well as the captive ballooning is taught at Roehampton, England.



That place is where the British Royal Air Force has its Lighter Than Air School. While the writer does not want to introduce personal experiences, there is one thing about Roehampton which is printed indelibly on his memory.

He landed in a hospital not very far from the balloon school on his return from France. Being rather shot to pieces, he was put to bed immediately, and for two or three days he was too sick to pay attention to anyone or anything. However, one day came when he was feeling quite chipper and with the sun streaming in on the floor of the ward he felt a bit better. As he sat up in bed he gazed out of the window opposite, and the first thing which met his eyes was the sight of three Caquot balloons riding in the sky. Right there he pinched himself to see if he was really awake, and, being convinced that he was, grave doubts of his sanity assailed him. The next time he looked for them they were not to be seen, but it was not till the next day that he summoned up enough courage to ask the nursing sister if she saw those balloons also. What he had been looking at were the balloons at the Roehampton school.

It was not an uncommon sight to see six or eight large spherical balloons floating over London at six to ten thousand feet altitude which had come from the Roehampton school. There are several places in the United States where the same thing may be seen almost every day, but outside of the immediate vicinity comparatively few people seem to know about it. Making a landing with a free balloon is a rather ticklish proceeding when one has to land in a thickly enclosed country. In England the balloon cadets used to try to land in the back garden of some jolly old chap, the idea being that they could then get someone else to pack up the balloon while the gallant balloonist was entertained at tea or lunch, etc. There might even be a pretty daughter in the house. Cupid has various methods and airmen as a rule know mostly all ways of getting acquainted. The warm, affectionate welcome which one is expecting is apt to be somewhat modified, if not totally absent, when one in trying to land on a gentleman's lawn misses connections and lads on his pet cucumber frames or his greenhouse, after having the drag rope wind itself round one or two of his chimney pots and pull them to the ground amid a shower of tiles. Even when all that happened on one occasion, I know of one case where the old chap chuckled and said it wasn't half as bad as the last air raid he had been through.

Free ballooning is, among numerous other things, one of the best sports I know of. It used to be the ambition of most of the balloon officers in France to have their balloon break away with a southeast wind blowing. I have forgotten just exactly what the bearing of the wind would have to be to land us in London, but we all knew while we were there. We all swore that if any of us ever broke away with that wind we would forget everything we ever knew about landing a balloon until we had crossed the Channel and could bring her down gently in London or as close as we could get. So far as I know no one ever got the chance to try it. Balloons have landed in London, however, and in the busiest part of the city at that. One day a great big spherical from Roehampton was forced to land right in the crossroads of a very congested street. The London policeman on duty there upheld the reputation of that force for capability, for as the gasbag settled to earth he simply reversed traffic without shifting his position, for all the world as though he had had notice of the balloon's descent there for a month in advance.

(*To be continued*)

Preparation for a free balloon flight. A spherical balloon just after she has been "got on her feet". The balloon has been inflated with gas and the basket has been attached. The photograph shows the instruments being attached and the final preparations being made. The man second from the top holds in his hand a string which when pulled will release the catch on the appendix. This is done just before leaving the ground as the gas expands at a height. Were the appendix not open the balloon would be in danger of bursting from the internal pressure. Free ballooning is a very necessary part of a balloon pilots training, for he not only learns how to handle his balloon in an emergency, but by it he acquires the "feel of the air". The photograph was taken at an American Naval training station

THE LIBERTY MOTOR

By G. DOUGLAS WARDROP. M. S. A. E., A. S. M. E.

THROUGH the courtesy of the Engine Production Division of the Bureau of Aircraft Production, we are enabled this week to present a series of most interesting photographs of the Liberty Twelve, the greatest achievement of America's aeronautic program. The history of the development of the motor is an amazing demonstration of the skill of American engineers and the capacity for production of the automotive industries. On May 26, 1917, the Liberty Motor was merely an idea; on June 5 drawings had been made; on July 24 a complete motor was tested, on November 29 first production deliveries were made; on October 12, 1918, the ten-thousandth motor was delivered to the Government! This feat has never been equalled in automotive engineering and production, and Colonels Hall and Vincent, with the engineers who co-operated closely with them, and the two-hundred manufacturing concerns who made the production possible, have merited the heartiest commendation.

The first official announcement concerning the Liberty was made by the War Department on May 15, 1918. The statement read:

"The design of the parts of the Liberty engine were based on the following:

"Cylinder—The designers of the cylinders for the Liberty engine followed the practice used in the German Mercedes, English Rolls Royce, French Lorraine Dietrich, and Italian Isotta Frachini before the war and during the war. The cylinders are made of steel inner shells, surrounded by pressed steel water jackets. The Packard Company by long experiment had developed a method of applying these steel water jackets. The valve cages are drop forgings welded into the cylinder heads. The principal departure from European practice is in the location of the hold-down flange, which is several inches above the mouth of the cylinder, and the unique method of manufacture evolved by the Ford Company. The output is now approximately seventeen hundred cylinder forgings per day.

"Cam Shaft and Valve Mechanism Above Cylinders Heads—The design of the above is based on the Mercedes, but was improved for automatic lubrication, without wasting oil, by the Packard Motor Car Company.

"Cam Shaft Drive—The cam shaft drive was copied almost entirely from the Hall-Scott motor; in fact, several of the gears used in the first sample engine were supplied by the Hall-Scott Motor Car Company. This type of drive is used by Mercedes, Hispano-Suiza, and others.

"Angle Between Cylinders—In the Liberty engine, the included angle between the cylinders is forty-five degrees; in all other existing twelve-cylinder engines it is sixty degrees. This feature is new with the Liberty engine, and was adopted for the purpose of bringing each row of cylinders nearer the vertical and closer together, so as to save width and head resistance. By the narrow angle greater strength is given to the crank case and vibration is reduced.

"Electric Generator and Ignition—A Delco ignition system is used. It was especially designed for the Liberty engine, to save weight and to meet the special conditions due to firing twelve cylinders, with an included angle of forty-five degrees.

"Pistons—The pistons of the Liberty engines are of Hall-Scott designs.

"Connecting Rods—Forked or straddle type connecting rods, first used on the French De Dion car and on the Cadillac motor cars in this country are used.

"Crank Shaft—Crank shaft design followed the standard twelve-cylinder practice, except as to oiling. Crank case follows standard practice. The forty-five degree angle and the flange location on the cylinders made possible a very strong box section.

"Lubrication—The first system of lubrication followed the German practice of using one pump to keep the crank case empty, delivering into an outside reservoir, and another pump to force oil under pressure to the main crank shaft bearings. This lubrication system also followed the German practice

An assembly of Liberty Twelves in the Marmon factory

in allowing the overflow in the main bearings to travel out the face of the crank cheeks to a scupper, which collected this excess of crank-pin lubrication. This is very economical in the use of oil and is still the standard German practice.

"The present system is similar to the first practice, except that the oil, while under pressure, is not only fed to main bearings, but through holes inside of crank cheeks to crank pins, instead of feeding these crank pins through scuppers. The difference between the two oiling systems consists of carrying oil for the crank pins through a hole inside the crank cheek, instead of up the outside face of the crank cheek.

"Propeller Hub—The Hall-Scott propeller hub design was adapted to the power of the Liberty engine.

"Water Pump—The Packard type of water pump was adapted to the Liberty.

"Carburetor—A carburetor was developed by the Zenith Carburetor Company for the Liberty engine.

"Bore and Stroke—The bore and stroke of the Liberty engine is 5 x 7 inches, the same as the Hall-Scott A-5 and A-7 engines, and as in the Hall-Scott twelve-cylinder engine.

"Remarks—The idea of developing Liberty engines of four, six, eight, and twelve cylinders with the above characteristics was first thought of about May 25, 1917. The idea was developed in conference with representatives of the British and French missions, May 28 to June 1, and was submitted in the form of sketches at a joint meeting of the Aircraft (Production) Board and the joint Army and Navy Technical Board, June 4. The first sample was an eight cylinder model, delivered to the Bureau of Standards, July 3, 1917. The eight-cylinder model, however, was never put into production, as advices from France indicated that demands for increased power would make the eight-cylinder model obsolete before it could be produced.

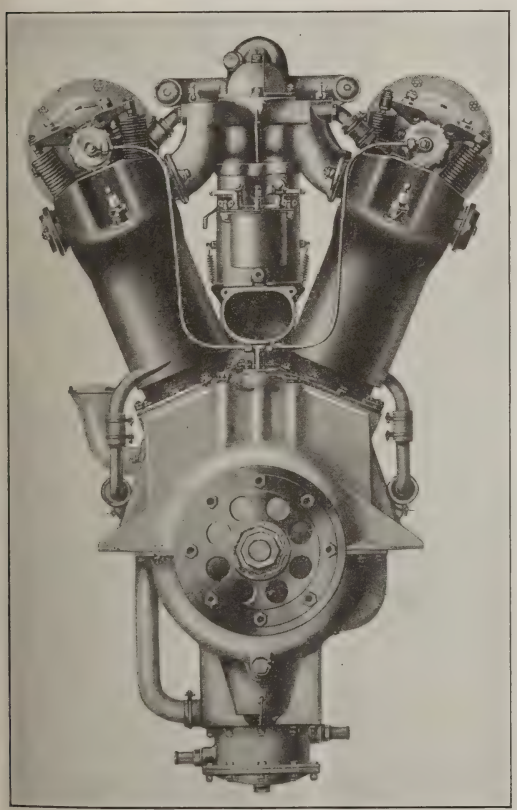
"Work was then concentrated on the twelve-cylinder engine, and one of the experimental engines passed the fifty-hour test August 25, 1917.

"After the preliminary drawings were made, engineers from the leading engine builders were brought to the Bureau of Standards, where they inspected the new designs and made suggestions, most of which were incorporated in the final design. At the same time expert production men were making suggestions that would facilitate production.

"The Liberty twelve-cylinder engine passed the fifty-hour test, showing, as the official report of August 25, 1917, records, that the fundamental construction is such that very satisfactory service, with a long life and high order of efficiency, will be given by this power plant, and that the design has passed from the experimental stage into the field of proven engines.

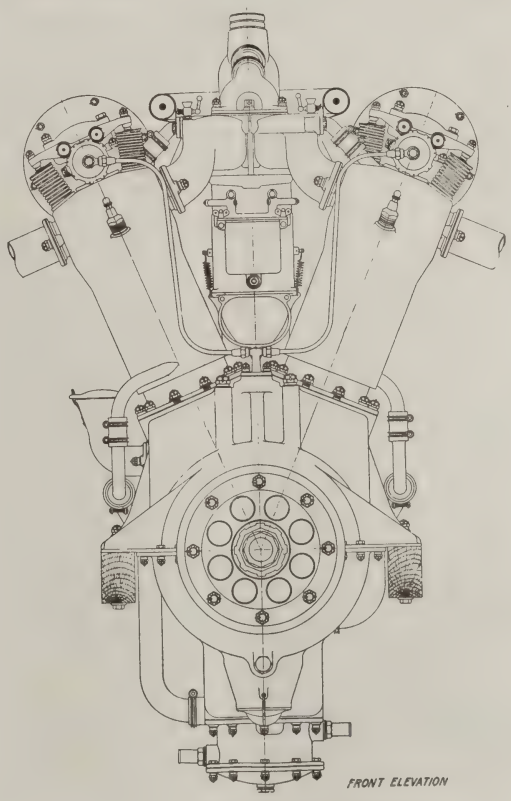
"An engine committee was organized informally, consisting of engineers and production managers of the Packard, Ford, Cadillac, Lincoln, Marmon, and Trego companies. This committee met at frequent intervals, and it is to this group of men that the final development of the Liberty engine is largely due."

The prime consideration of the designing engineers was to have a motor that would be efficient from every modern standpoint, and at the same time suitable for production on a rapid basis. Both results have apparently been achieved.



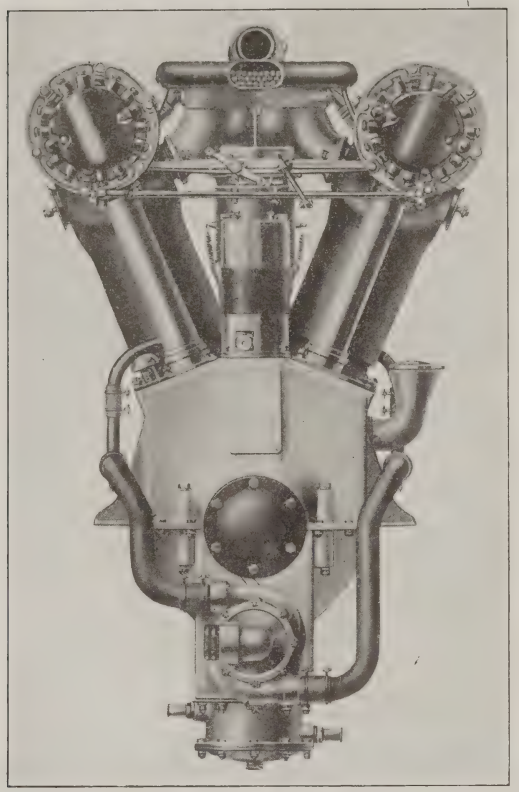
Before proceeding to a discussion of the detail of the motor, the following dimensions and characteristics are of interest:

General Data:

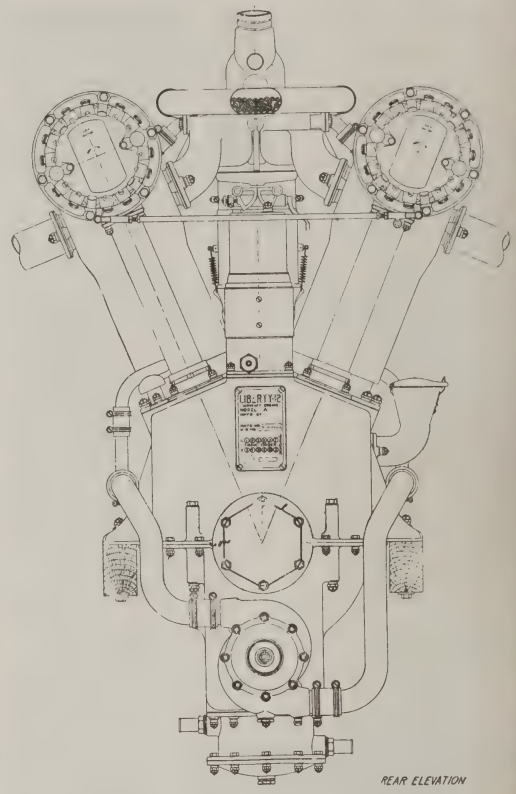


Number and arrangement of cylinders	Twelve-Vee
Included angle	45°
Bore	5″
Stroke	7″
Stroke-bore ratio	1.4:1
Area of one piston	19.635 sq. in.
Total piston area	234.62 sq. in.
Swept volume of one cylinder	137.445 cu. in.
Displacement of motor	1649.5 cu. in.
Compression ratio (Army)	5.4:1
Compression ratio (Navy)	5.:1
Normal brake H. P.	400 at 1750 RPM
Type of valve gear	Overhead cam shaft and valve rockers
Number of carburetors	Two Duplex Zenith

Valves:



Number per cylinder	One inlet and one exhaust
Outside diameter	2¾″

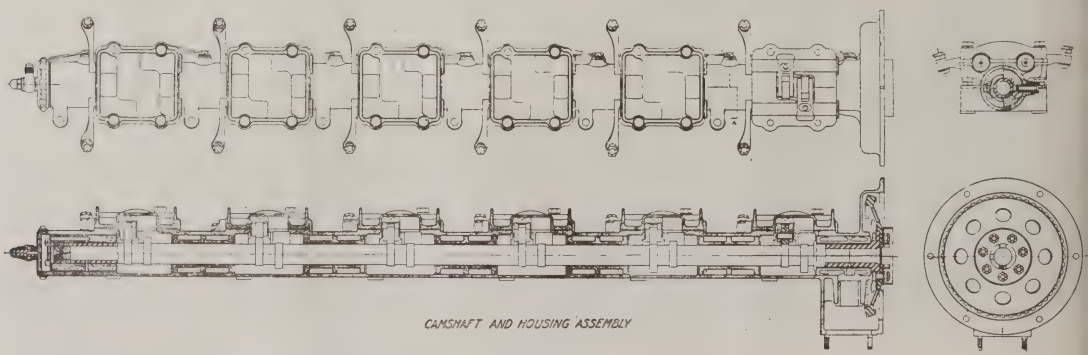


The propeller end of the engine, showing the arrangement of the carbureter and manifold

Front elevation of the Liberty Twelve

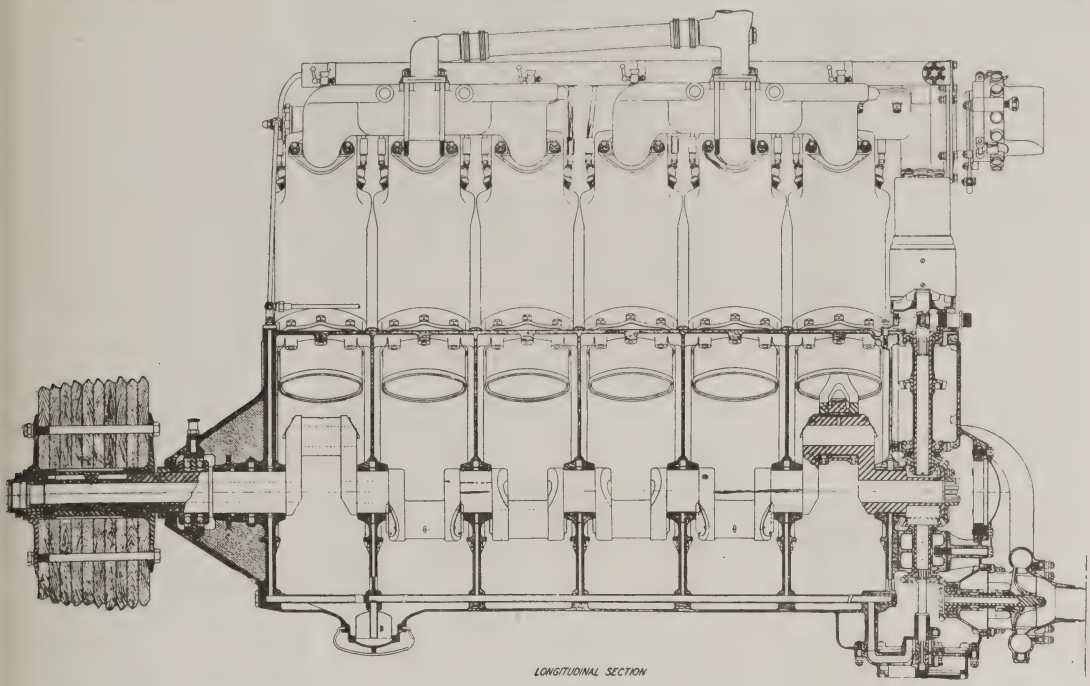
Anti-propeller end of the Liberty Twelve

Rear elevation of the Liberty Twelve



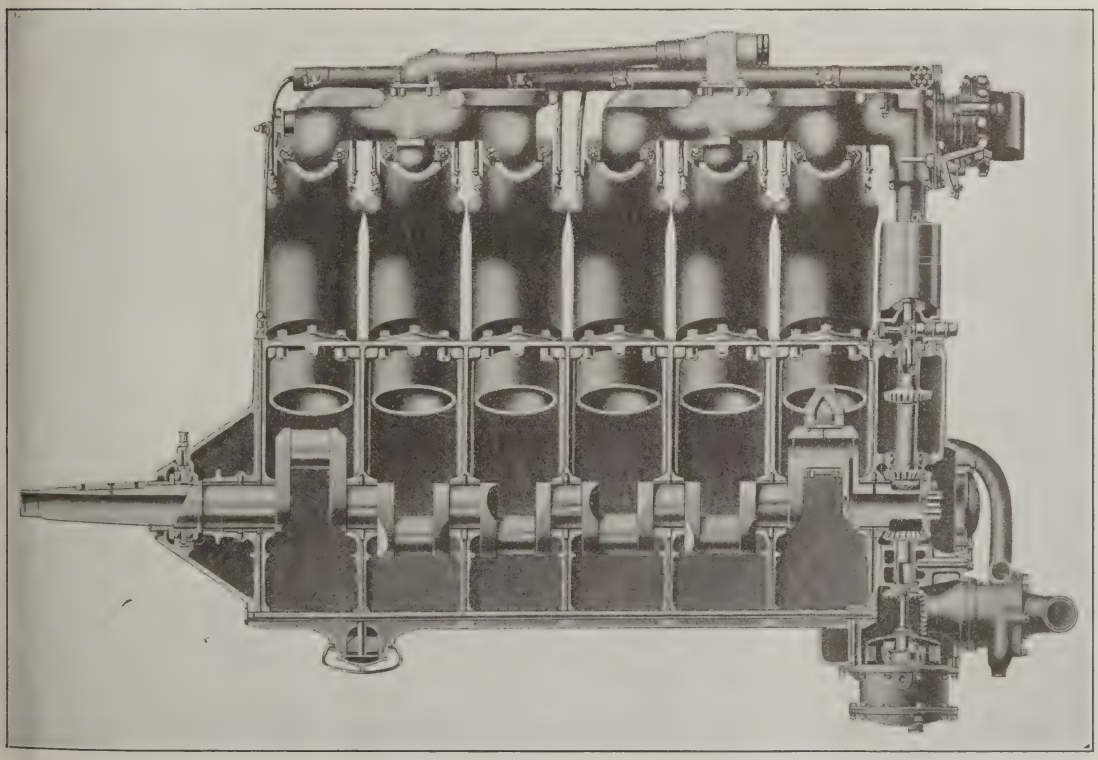
Port diameter	2½″
Width of seat	⅛″
Angle of seat	30°
Valve lift (Inlet)	7/16″
Valve lift (Exhaust)	⅜″
Diameter of stem	7/16″
Length of Valve	6 3/16″
Number of springs per valve	2 concentric
Length of spring in position	2 3/16″
Mean diameter of coils (large spring)	1 7/16″
Mean diameter of coils (small spring)	1″
Inlet rocker clearance	.015″
Exhaust rocker clearance	.020″
Included angles of valves	27°

Cylinders:



Overall height of cylinders	16 13/16″
Length of projection in crankcase	57/64″
Diameter of cylinder over waterjacket	6¾″ max.
Diameter of cylinder over waterjacket	5 13/16″ min.
Thickness of flange (base)	¼″
Number of studs	10
Diameter of stud	⅜″
Thickness of waterjacket	3/64″
Thickness of cylinder head	3/16″
Thickness of combustion chamber-wall	5/32″
Thickness of cylinder barrel	⅛″
Number of reinforcing ribs	8
Thickness of valve ports	⅛″
Diameter of port at valve	2½″
Diameter of port at flange	2⅛″
Number of spark plugs	2 per cylinder

Pistons:



Type of piston (Army)	Crowned
Type of piston (Navy)	Flat
Material	Aluminum
Length of piston	5″
Length to diameter ratio	1:1
Number of rings per piston	3

Number of teeth	16
Width of face	½"
Diameter of inclined drive shaft	¾"

Crankcase (upper):

Material	Aluminum
Thickness of wall	3/16"
Thickness of cylinder pads	½"
Thickness of supporting flange	3/16"
Center distance of motor support bolts	16¾"

Crankcase (lower):

Material	Aluminum
Thickness of wall	⅛"

Lubrication:

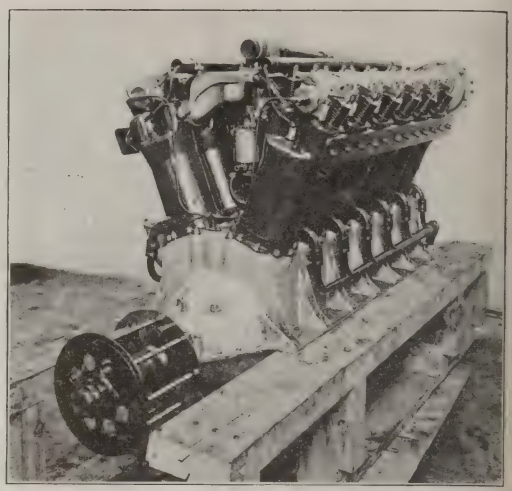
Type	Forced feed
Type of pumps	Rotary gear
No. of pumps	1 double pressure and 1 scavenging
Ratio of pump speed to crankshaft speed	1.5:1

Ignition:

Type	Battery and generator
Firing order	L 1-9-5-11-3-7, R 8-4-12-6-10-2
Number of plugs per cylinder	2

Type of plug	A. C.
Ratio of generator speed to crankshaft speed	1.5:1

Cooling System

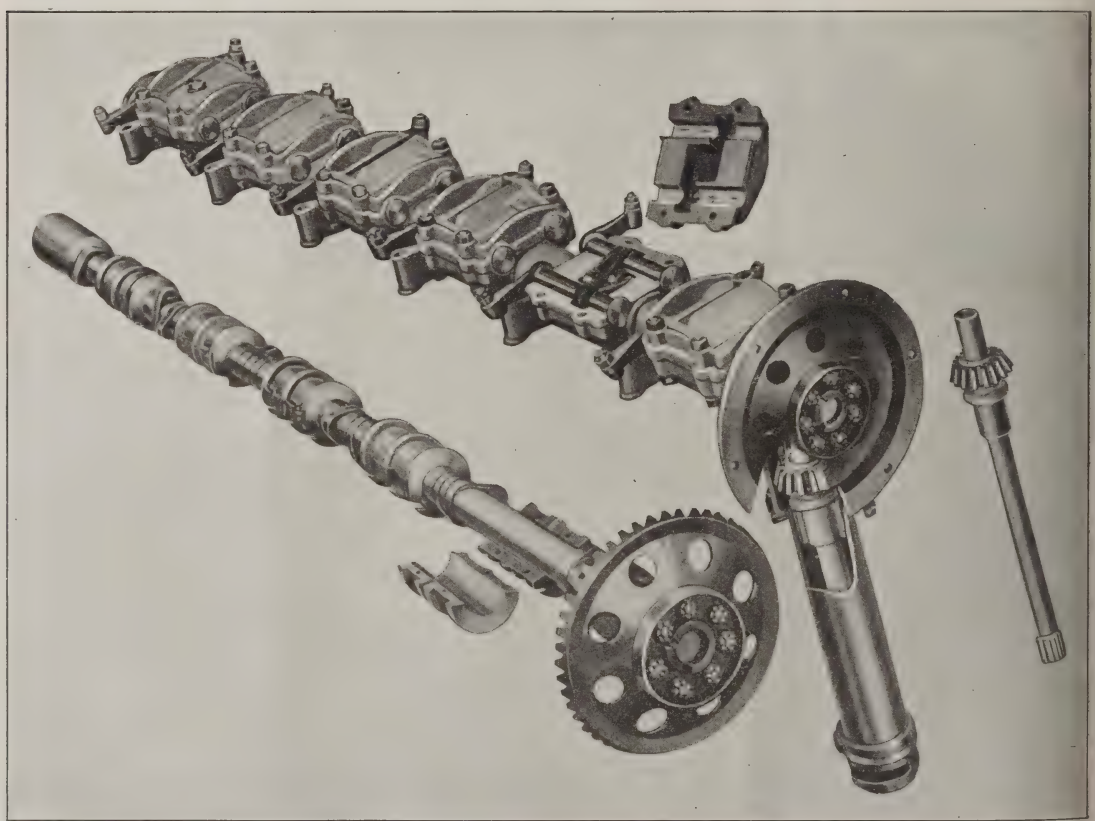


Type	Water cooled
Pump	1 centrifugal
Diameter of inlet pipe	2"
Diameter of outlet pipe	1⅜"
Number of outlets	2
Diameter of rotor	3⅛"
Ratio of pump speed to crankshaft speed	1.5:1
Water temperature inlet	155° F.
Water temperature outlet	175° F.

Ignition System

The ignition system used on the Liberty Twelve is known as the generator-battery type. The system comprises two independent breaker and distributor mechanisms, identical in every respect and each one firing all twelve cylinders. For starting and for idling speeds up to 650 R.P.M. current is drawn from a specially constructed four cell storage battery. The battery is very light and carries very little liquid or electrolyte. Nevertheless, it has sufficient capacity to ignite the engine at full speed for three hours. It is so constructed that, even though it be turned upside down, it will still continue to function properly.

In addition to the battery, a positively clever generator is provided, so geared that it runs at one and one-half times crankshaft speed.



Electrical energy for starting and idling speeds is supplied by the battery. As the engine speed is increased, the generator "builds up" and its output grows greater until, at about 650 R.P.M. the generator voltage equals that of the battery. The maximum generator outputs exceed the requirements for ignition so that, at speeds above 650 R.P.M., the direction of flow current is reversed and the excess output of the generator goes to recharge the battery. The generator is controlled by a "voltage regulator" which prevents the output exceeding a predetermined figure. In view of this fact, the generator will supply current for ignition indefinitely, without the battery, so long as the engine speed is not allowed to drop below 500 R.P.M. A duplex switch permits of either one or both distributors being turned "on," and the switch is so constructed that either set of ignition alone can be used without connecting the generator.

Propeller and three-quarter view of a Marmon constructed Liberty Twelve

Carburetion

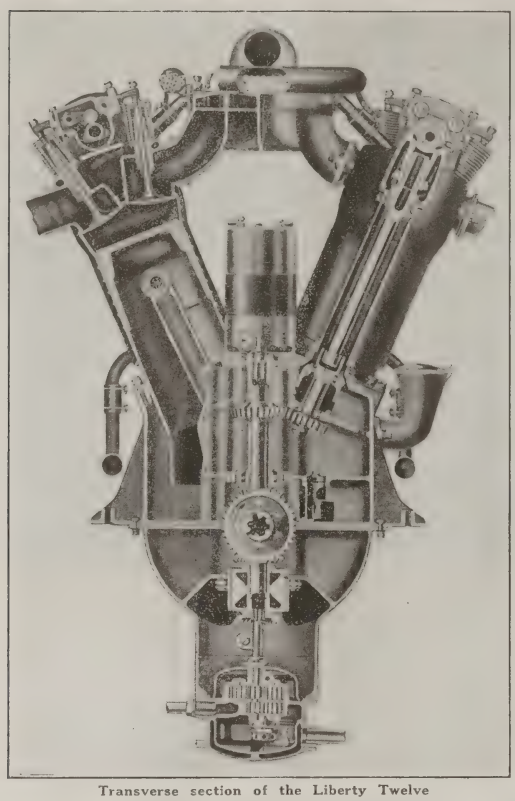
Two Zenith duplex carbureters are used on the Liberty Twelve. This is equivalent to four single carbureters, each one supplying three cylinders of the engine. Each duplex

Camshaft and camshaft housing of the Liberty Twelve

Final assembly of Liberty Twelve

carbureter consists of a single float chamber and a single air inlet joined to two separate and distinct spray nozzles, venturi and idling devices. As the V-type engine is, in a sense, two separate engines joined together for greater utility, so the Zenith is built in double form for the purpose of supplying each one of these two engines with its exact requirements. Each of the two barrels of each carbureter is fitted with a throttle valve of the butterfly type. The shafts of the throttles are parallel with the center line of the engine, and are interconnected by means of gear sectors pinned to the throttle shafts and meshing together. The two pairs of throttles are operated simultaneously by a shaft, provided with an adjustment at each end by means of which the pairs may be synchronized. Each duplex carbureter is fitted with an "altitude adjustment" which affects both barrels equally.

Gasoline from the tank enters the float chamber through the gasoline inlet D and the needle valve seat S, lifting the float F. As soon as the gasoline reaches a predetermined height in the float chamber, the metal float F, acting through the levers B and the collar G2, closes the needle valve G1 on its seat S.



From the float chamber to the engine, gasoline flows through three different channels in various quantities and proportions, according to the size of nozzle, speed of motor and to the degree of throttle opening. At low speed when the butterfly throttle valve T is nearly closed, there is little or no suction in the throat X, but as there is considerable suction at the edge of the throttle T, gasoline is drawn through the idling device instead of through the jets G and H. This device (see Figure 31) consists of the idling tube M within the secondary well P inserted in the main well J, at the bottom of which the compensator I is located, and which is open to the atmosphere through holes A.

Gasoline from the compensator I flows through the calibrated hole in the bottom of the secondary well P (which is open to the air through holes Y) thence through the passage R to an opening opposite the throttle valve.

With the throttle fully open most of the gasoline flows

Grinding operations on Liberty Twelve parts in one of the Detroit factories

Transverse section of the Liberty Twelve

through the channel E and main jet G; some flows through compensator I, which is located at the bottom of the well J, open to the atmosphere through holes A (see Figure 31), then through channel K to the cap jet H which surrounds the main jet. Main jet and cap jet work together and furnish the proper mixture at all motor speeds.

Oiling System

Oil supply is carried in a reservoir provided with a suitable means for cooling it. Oil is led from this reservoir to the connection on the right side of the oil pump body marked "Oil In." It is filtered at this point through a large area fine mesh screen. A delivery pump of the gear type takes the oil up after it has passed through the screen and delivers it under considerable pressure to a distributor pipe running the entire length of the crankcase. Opening out of the passage between the pump and the distributor pipe is a pressure regulating valve designed to maintain a pressure not to exceed fifty pounds per square inch on the oiling system.

Pipes are fitted in the case leading from the distributor pipe to the main crankshaft bushings.

The crankshaft is hollow and in the center of each main bearing a radial hole is drilled through the shaft into the hollow center. This hole in the shaft registers with the corresponding hole in the bearing bushing once every revolution of the shaft, at which time a small quantity of oil is forced through into the hollow crankshaft. A passage leads from each hollow main bearing to the adjacent crank pin, which is also hollow. A radial hole is also drilled through each crank pin and carries the oil out on the surface of the pin. Oil grooves and passages in the connecting rod bushings insure proper lubrication for both the forked and plain connecting rods.

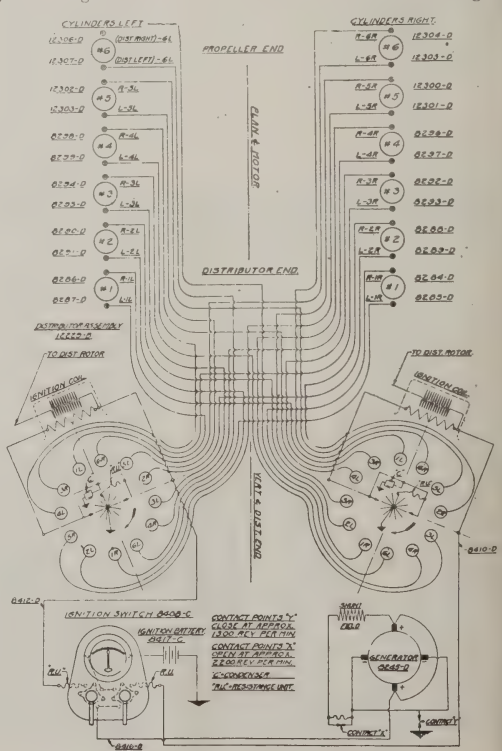
The excess oil thrown off the rapidly moving connecting rod ends forms a mist which lubricates the piston pins and the cylinder walls.

Part of the oil conducted to the main crankshaft bearing at the propeller end of the engine goes through a passage around this bearing and up through pipes to the propeller end of the camshaft housings. From the end of the camshaft housings it is led around the end camshaft bearing to a passage drilled diametrically through the bearing midway of its length. Once every revolution of the camshaft a hole drilled through the camshaft into its hollow center registers with the oil passage through the bearing.

Thus once every revolution a small quantity of oil is forced into the hollow camshaft.

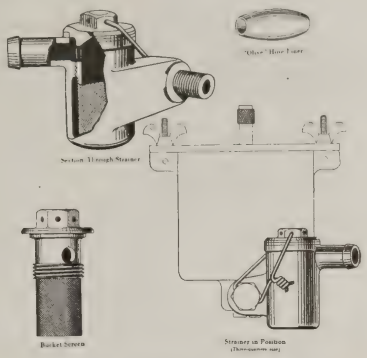
The oil is led through the camshaft and out through holes drilled in it to each camshaft bearing. The excess works out of the ends of these bearings and collects in small reservoirs to a depth of about ¼". The cams, in revolving, dip into this oil and splash it over the cam rollers and into pockets in the rocker lever shafts. From these pockets it is led through the hollow rocker shafts to the rocker shaft bearings.

The excess oil eventualy finds its way to the gear end of the camshaft housings, over the gears and down the drive shaft housing into a chamber just above the oil pump.



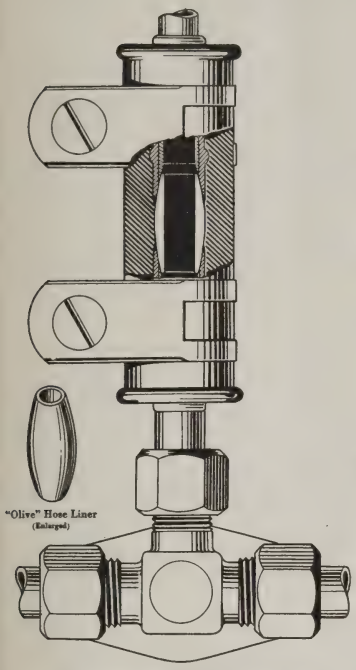
The excess oil thrown off in the crankcase by the connecting rods collects in this same chamber when the engine is inclined so that the propeller end is high. If the propeller end of the engine is low, this oil collects in a small sump or chamber at the propeller end of the crankcase.

Immediately above the *oil delivery* pump is located an *oil return pump* consisting of three gears, and driven by the same shaft as the delivery pump. The function of this oil return pump is to draw the excess oil out of the crankcase and return it to the oil reservoir. One-half of this pump draws oil from the sump at the propeller end of the crankcase and the other half draws oil from the sump at the distributor end of the crankcase. Both halves of the pump deliver oil to the connection on the left side of the oil pump body marked "Oil Out," from which point it returns to the oil reservoir.



Cooling System

Cooling water is circulated through the Liberty engine by means of a centrifugal pump running at one and one-half times engine speed. The capacity of this pump is 100 gallons per minute at 1,700 R.P.M. The cooling system from the pump inlet to and including the water outlet header will hold 5½ gallons of water.



The water pump is provided with a single inlet, the outside diameter of which is 2", and two outlets, each one delivering water to a header supplying the right and left hand cylinders respectively. Water is forced into each cylinder jacket tangent to its outside surface. This construction gives

the water a whirling motion inside the jacket and insures uniform cooling.

The water outlet pipe for each cylinder extends inside the jacket to a point very close to the exhaust valve chamber, which guarantees the proper cooling of the exhaust valve. The cooling water then goes through a passage cored in the intake headers. This serves to warm and further vaporize the incoming gas as well as assist in coling the water. These passages in the intake headers are connected by two water outlet headers, the final outlet of which has an outside diameter of two inches.

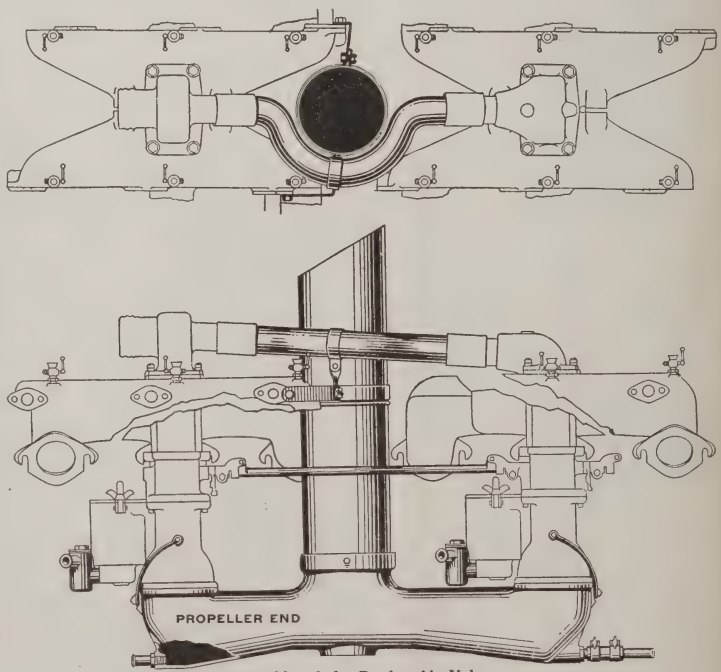
Carburetor Air Intake

Tests have recently been conducted at Detroit and at McCook Field, Dayton, Ohio, to determine upon the best way of modifying the present carbureter air intakes to decrease the fire hazard.

The design which proved the most satisfactory is shown in an accompanying drawing and consists of a T-shaped casting with the air intake extended upwards, in the form of a pipe stack, through the top of the engine bonnet. Drain tubes are provided at either end to carry the gasoline waste outside of the fuselage.

Dynamometer and flight tests made at McCook Field have demonstrated the performance of the new arrangement to be fully as efficient as that of the old, while the fire hazard has been greatly reduced by draining away gasoline drippings from the hot engine "V," and carrying the carbureter back-fire flame out of the hood. This thorough gasoline drain and consequent absence of combustible vapor also protects the pilot from the fire hazard of incendiary bullets passing through the bonnet.

With this construction it is not difficult to make jet inspection or changes. By sliding up the pipe stack, springing off the attaching bails and disconnecting drain tubes, the manifold can be moved forward or backward as desired, to reach the jets of either carbureter.



The changes necessary in making this installation consists of replacements to provide clearance for the new intake stack and its parts. These changes consist of new offset or curved intake header water curved carbureter throttle control connection. New and larger drain tubes are also included.

A hole must be cut in the motor bonnet to provide for the exit of the air intake pipe stack which is cut at an agle above the top of the bonnet so that pressure may be produced in the air intake by the propeller slip stream.

Carburetor Altitude Adjustment

The altitude adjustment on Zenith type U. S. "52" carbureter furnished on Liberty "12" cylinder engines is of limited range because the float chamber vent, which supplies air to both the float chamber and compensator, is too large for the best results. It is the purpose of this adjustment to cut down the flow of gasoline through the jets at high altitude where the air is thinner and lighter. Weighing less per unit volume here than at sea level, the air contains less oxygen to support combustion and must, therefore, need less gasoline for the most economical mixture. The altitude valve links up the float chamber with the engine suction at the carbureter throat for the purpose of holding back the flow or applying a gasoline brake. However, instead of maintaining a partial vacuum on the gasoline in the float chamber to retard its flow through the jets at high altitude, the screened air vents nullify this effect through their excess capacity.

To correct this condition without interfering with air supply to the compensator, modifications have been made in the original design by removing the screened air vents, plugging the holes in the casting, and drilling a new compensator air intake vent as shown in sketch Figure 4 and drawing Figure 1. Venting of the float chamber is thus accomplished through the air passage around the secondary well of the idling sys-

Assembly of the Duplex Air Valve

Note.—The illustration shows the new gasoline strainer in place.

tem, but is partially restricted by a collar added to the secondary well as shown in sketch, Figure 3. The diameter of this collar determines the amount of air restriction and, hence, the degree of vacuum permitted in the float chamber. This, in turn, directly affects the flow at the jets and, hence, the gasoline economy.

Flight tests made at McCook Field show that the use of this altitude adjustment will enable the operator to effect a gasoline economy of approximately 30 per cent. under that obtained formerly at the same engine R.P.M. and at an altitude of 18,000 feet.

In addition it has been found advantageous to employ progressive slot openings in the altitude valve, instead of the parallel drill holes formerly employed. (See Figure 2.) The slots coming into action progressively permit a more gradual leaning of the mixture, and the use of a greater range somewhat in excess of that actually required. The pilot can ascertain that the valve is operating by pulling the control back further than necessary and noting the falling off in engine R.P.M.

Changes can be made by dismounting the carbureter from the engine, and removing the throttle housing, the choke, the idling well system, the float mechanism and the altitude valve. Drill two No. 17 holes (see sketch, Figure 4, and drawing, Figure 1) into main well and securely plug air vent hole with special plug shown on drawing, Figure 1, and which must be positively locked in place by the attachment of the throttle housing. Build up shoulder of solder (for temporary use) on secondary well shown in sketch, Figure 3, and machine to dimensions of which diameter is most important. Insert new altitude valve. Reassemble the carbureter in the usual way, and stamp letter "A" on carbureter body as shown in drawing, Figure 1. All carbureters now coming through have letter "A" cast in place, which refers to venting of well only. To check up on altitude valve, pull out and note whether drilled or slotted.

"Olive" Oil-Hose Liner

The "olive" in the oil hose line is designed to reinforce the strength of the rubber tubing, and to act as a spacer with its tapered ends slipping into the countersunk openings of the oil pipe and the three-way valve connection when these two are pushed snugly into the rubber hose. In this way, the rubber hose is protected from full contact with the oil pressure and pieces of rubber which may be loosened through deterioration are not liable to enter the oiling system.

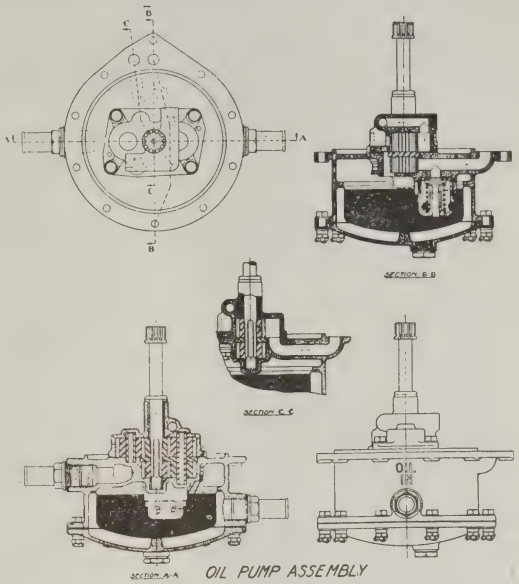
An improved olive is now in production which is shorter and smaller than the one formerly used. The new olive is 5/8" in length instead of 1", and is .304 plus or minus .004 in outside diameter.

All engines now going through have the smaller "olive" in place.

Vertical Shaft Packing Nut Lock

The packing nut used on the camshaft driving shaft housing where the upper and lower housings join is now further secured by a simple stamped steel lock employed as illustrated.

This lock can be used over either of the two outside studs on each of the two housings and is held in place by the usual castellated nut. The one-sixteenth inch thickness of the lock will make it difficult to insert the cotter pin as formerly but a smaller wire will answer the purpose, and prevent nut from loosening.



Water Pump Impeller Puller

An improved method of removing the water pump impeller without damage from its firm seat on the tapered shaft is clearly illustrated.

The new impeller puller now going into production performs this operation with ease, and is of the usual cup and screw type. The cup is threaded to engage the end of the impeller hub while the action of the screw draws the impeller off the shaft. The screw is always retained in the cup by punching the edge of the first screw thread to prevent disassembly.

Carbureter Gasoline Strainer

There has been some difficulty experienced through dirt working into the carbureter jets, and disturbing the measured flow necessary for the best results. This has been made possible because there has been no strainer in the gasoline system between the tank and the carbureter; and gasoline coming into contact with rubber hose will rot this in time, causing particles of rubber to be carried along into the carbureter.

To avoid this difficulty, a gasoline strainer has been designed to filter the gasoline entering the float chamber and to make an easy mechanical breakdown for removing the carbureter. This strainer incorporates a bucket screen. The gasoline entering from the top filters through the screen while the dirt is caught in the bottom of the bucket, which can easily be removed and emptied at intervals.

As a further protection against rubber particles a brass hose liner or "olive" is inserted in the rubber hose. This strengthens the hose and acts as a spacer between the supply pipe and the strainer intake; the tapered ends of the "olive" fitting into the beveled ends of the pipe and strainer preventing the gasoline from coming into direct contact with the rubber.

To install the strainer assembly, it is only necessary to remove the gasoline connection from the carbureter bowl and screw the strainer in its place. The gas line attaches to the gasoline connection at the top of the strainer by means of the rubber hose containing the brass hose liner. Suitable clamps are furnished.

AC Titan Aeroplane Spark Plugs

It has been found desirable to issue general instructions covering the care and adjustment of the AC Titan, used on Liberty 12-cylinder engines, as many plugs have been unnecessarily destroyed through rough treatment. Spark plug production is not up to government needs and all departments should practice conservation to meet the scarcity of this article. The following description and directions are important:

The AC Titan is known as a one-piece, or integral, plug wherein the porcelain is sealed with a gas-tight joint (at No. 6) into the shell and the central electrode is cemented into the porcelain. Unless the plug is preserved in its original gas-tight condition, its value is destroyed. Rough handling can easily crack the porcelain, while too much tool pressure in screwing down may cause a fracture of the joints. No mechanical repairs are ever required, and must not be attempted.

In Figure A is shown a cross-section of this plug. The ball terminal connection No. 1 is screwed on the upper end of the center wire No. 5, and a special riveting operation is performed to prevent it from coming loose. As the pressure applied in this operation is necessarily limited, it sometimes happens that on a small number of plugs part No. 1 is not rigid. A slight play here has no bearing on the action of the plug, and any attempt to tighten it may ruin the porcelain.

In Figure B is shown a special terminal connection used in Hispano-Suiza motors. In Figure C is shown a combination terminal connection which will be standard on all AC Titan aeroplane plugs by January 1, 1919.

REPORT OF THE DIRECTOR OF MILITARY AERONAUTICS

WAR DEPARTMENT,
OFFICE OF THE DIRECTOR OF MILITARY AERONAUTICS,
November 3, 1918.

SIR: I have the honor to submit herewith the annual report of the Division of Military Aeronautics for the fiscal year ended June 30, 1918. Though the Division of Military Aeronautics was created only on April 24, 1917, it was agreed that the duties intrusted to it and previously carried out by the Signal Corps should be covered in this report in order to present a continuous story of the development of the personnel, training, and organizing phases of the present Air Service. Also it should be pointed out that operations on the front in France have been left largely to whatever report the American Expeditionary Force may deem wise.

The fiscal year 1917-18 saw aviation develop from a wholly subsidiary branch of the Army as the Aviation Section of the Signal Corps to a position of extreme and decisive importance as the Air Service, directly under the Chief of Staff. From the most insignificant beginnings it came within the year to be one of America's major efforts in the war.

This is all the more surprising when America's previous backwardness in aviation is considered. This country has stood practically still in aerial progress, while the war in Europe brought about an extraordinary advance. From all this the United States was entirely shut off up to the time it abandoned neutrality. So little exact knowledge was available that the first American planes to go with the expedition into Mexico in March, 1916, were all rendered useless in accidents within a short time of arrival. There was practically no aviation technique here comparable to Europe's, almost negligible manufacturing facilities, not a hundred trained flyers, and only the most rudimentary facilities for training. Moreover, no one had any adequate appreciation of the intricacy and skill required in the making of either an aeroplane or the training of a pilot.

As against this stagnation Europe's progress in two and one-half years of war had been tremendous. The first planes to go to the front in 1914 had been few in number, unequipped with radio, machine guns, bombs, or photographic apparatus, and entirely unproved in military value. Their extraordinary success, however, in disclosing the size of the German concentration in Belgium at once brought them into a position of great importance. Very shortly radio was installed to replace signaling by dropping tinsel or making curious evolutions; the pistols of the pilots gave way to machine guns; the easy-going system of dropping bombs over the side was replaced by regular bombing planes, and the occasional taking of photographs by an intricate system of picturing every mile of the front. Engine power increased to 200, 300, 400, 500 horsepower; huge planes with large carrying capacity were being developed for night bombing; and operation were taking place by whole squadrons in various air strata—light, single-seater scouts around 15,000 to 20,000 feet, two-seater day bombers around 9,000 feet, and photographic and observation planes around 6,000 feet.

In contrast to all this development the United States at the time of its entry into the war stood very little ahead of where it had been before the world war broke out. Aviation, both in its personnel and its equipment, was included in that part of the Signal Corps known as the Aviation Section, which had been established by Congress July 18, 1914. Its chief was Maj. Gen. George O. Squier, who after four years as military attaché in London, had been put in charge of the Aviation Section in May, 1916, and made Chief Signal Officer on February 14, 1917, continuing to have charge of aviation through nearly the whole of the fiscal year. On April 6, 1917, the total assets on hand consisted of 65 officers, 1,120 men, two small flying fields, less than 300 very second-rate training planes, practically no manufacturing facilities, and only the most meager technical information as to Europe's startling developments.

The original American war program, based on an army of a million men, made aviation but a relatively insignificant part of the general military forces. This program, which represented the view of the General Staff before the arrival of the foreign missions, was met by two appropriations, $10,800,000 on May 12, 1917, and $43,450,000 on June 15, many times larger than any appropriations ever before made.

The British and French missions, however, arriving the last part of April, completely revolutionized this viewpoint. Supported by an urgent cable of May 24 from the premier of France, calling for 2,000 planes a month and a total of 5,000 pilots and 50,000 mechanicians, the $640,000,000 appropriation, the largest ever made by Congress for one specific purpose, was drawn up, put through the House of Representatives Military Affairs Committee in two meetings, the House itself in one, the Senate Military Affairs Committee in 45 minutes, and the Senate itself a week later, becoming law on July 24, 1917. On this date the present large program was really launched, two months and a half after the outbreak of war, and largely in response to allied appeals.

The rest of the fiscal year was taken up in amplifying and executing the lines of effort here laid down. Toward the end of the year, however, it became obvious that the system of organization of an Aviation Section as a subsidiary branch of the Signal Corps was not functioning efficiently. The British and French, perceiving that we were encountering the same kind of obstacles as theirs, strongly recommended a separate, independent air service similar to the air ministries they had been obliged to establish and which have worked so successfully since. As a result, a first step was taken in a rearrangement of duties designed to effect a greater independence and a greater concentration of authority when, on April 24, the War Department authorized the following statement:

Mr. John D. Ryan has accepted the directorship of aircraft production for the Army.

A reorganization of the Aviation Section of the Signal Corps has been also effected, of which the principal elements are as follows:

Gen. Squier, as Chief Signal Officer, will devote his attention to the administration of signals; a Division of Military Aeronautics is created, under the direction of Brig. Gen. William L. Kenly. The Aircraft Board, created by act of Congress, remains as an advisory body, as it has been in the past, with Mr. Ryan as its chairman. This arrangement is made with the entire concurrence of Mr. Howard Coffin, who remains a member of the Advisory Commission of the Council of National Defense and will render assistance and counsel to the Aircraft Board and Mr. Ryan.

The Division of Military Aeronautics will have control of the training of aviators and military use of aircraft. The exact division of functions in the matter of designing and engineering will be worked out as experience determines between the Devision of Military Aeronautics and the Division of Production.

This announcement involves no change of personnel in the present Equipment Division of the Signal Corps, of which W. C. Potter is chief, and which will continue under his direction.

This reorganization, however, was admittedly but the first step. The first action taken by the President under the broad powers of the Overman Act was to effect a still further reorganization by taking aviation entirely out of the jurisdiction of the Signal Corps, where it has been from its inception on July 18, 1914, and to set up two separate bureaus, one for securing and training the large flying and ground forces and the other for providing planes, engines, and equipment.

The presidential order of May 21 covering this change follows:

By virtue of the authority in me vested as Commander in Chief of the Army and by virtue of further authority upon me specifically conferred by "An act authorizing the President to coordinate or consolidate executive bureaus, agencies, and offices, and for other purposes, in the interest of economy and the more efficient concentration of the Government," approved May 20, 1918, I do hereby make and publish the following order:

The powers heretofore conferred by law or by Executive order upon and the duties and functions heretofore performed by the Chief Signal Officer of the Army are hereby redistributed as follows:

I.

(1) The Chief Signal Officer of the Army shall have charge, under the direction of the Secretary of War, of all military signal duties, and of books, papers and devices connected therewith, including telegraph and telephone apparatus and the necessary meterological instruments for use on target ranges, and other military uses; the construction, repair, and operation of military telegraph lines, and the duty of collecting and transmitting information for the Army by telegraph or otherwise, and all other duties usually pertaining to military signaling; and shall perform such other duties as now or are or shall hereafter be devolved by law or by Executive order upon said Chief Signal Officer which are not connected with the Aviation Section of the Signal Corps or with the purchase, manufacture, maintenance, and production of aircraft, and which are not hereinafter conferred, in special or general terms, upon other officers or agencies.

(2) A Director of Military Aeronautics, selected and designated by the Commander in Chief of the Army, shall hereafter have charge, under the direction of the Secretary of War, of the Aviation Section of the Signal Corps of the Army, and as such shall be, and he hereby is, charged with the duty of operating and maintaining or supervising the operation and maintenance of all military aircraft, including balloons and aeroplanes, all appliances pertaining to said aircraft and signaling apparatus of any kind when installed on said aircraft, and of training officers, enlisted men, and candidates for aviation service in matters pertaining to military aviation, and shall hereafter perform each and every function heretofore imposed upon and performed by the Chief Signal Officer of the Army in, or in connection with, the Aviation Section of the Signal Corps, except such as pertains to the purchase, manufacture, and production of aircraft and aircraft equipment and as is not hereinafter conferred, in special or general terms, upon the Bureau of Aircraft Production; and all aeroplanes now in use or completed and on hand and all material and parts, and all machinery, tools, appliances, and equipment held for use for the maintenance thereof; all lands, buildings, repair shops, warehouses, and all other property, real, personal, or mixed, heretofore used by the Signal Corps in, or in connection with, the operation and maintenance of aircraft and the training of officers, enlisted men, and candidates for aviation service, or procured and now held for such use by or under the jurisdiction and control of the Signal Corps of the Army; all books, records, files and office equipment heretofore used by the Signal Corps, in, or in connection with, such operation, maintenance, and training; and the entire personnel of the Signal Corps as at present assigned to, or engaged upon work in, or in connection with, such operation, maintenance, and training, is hereby transferred from the jurisdiction of the Chief Signal Office and placed under the jurisdiction of the Director of Military Aeronautics; it being the intent hereof to transfer from the jurisdiction of the Chief Signal Officer to the jurisdiction of the said Director of Military Aeronautics every function, power, and duty conferred and imposed upon said Director of Military Aeronautics by subparagraph (2) of paragraph I hereof all property of every sort of nature used or procured for use in, or in connection with, the functions of the Aviation Section of the Signal Corps placed in charge of the Director of Military Aeronautics by subparagraph (2) of paragraph I hereof, and the entire personnel of the Signal Corps in charge of the Director of Military Aeronautics by subparagraph (2) of paragraph I hereof.

(3) An executive agency, known as the Bureau of Aircraft Production, is hereby established, and said agency shall exercise full, complete, and exclusive jurisdiction and control over the production of aeroplanes, aeroplane engines, and aircraft equipment for the use of the Army, and to that end shall forthwith assume control and jurisdiction over all pending Government projects having to do or connected with the production of aeroplanes, aeroplane engines, and aircraft equipment for the Army and heretofore conducted by the Signal Corps of the Army, under the jurisdiction of the Chief Signal Officer; and all material on hand for such production, all unfinished aeroplanes and aeroplane engines, and all unfinished, unattached, or unassembled aircraft equipment; all lands, buildings, factories, warehouses, machinery, tools, and appliances, and all other property, real personal, or mixed, heretofore used in or in connection with such production, or procured and now held for such use, by or under the jurisdiction and control of the Signal Corps of the Army; all books, records, files, and office equipment used by the said Signal Corps in or in connection with such production; all rights under contracts made by the Signal Corps in or in connection with such production; and the entire personnel of the Signal Corps as at present assigned to or engaged upon work in or in connection with such production are hereby transferred from the jurisdiction of the Signal Corps and placed under the jurisdiction of the Bureau of Aircraft Production, it being the intent hereof to transfer from the jurisdiction of the Signal Corps to the jurisdiction of the said Bureau of Aircraft Production every function, power, and duty connected with said production, all property of every sort or nature used or procured for use in or in connection with said production, all property of every sort or nature used or procured for use in or in connection with said production, and the entire personnel of the Signal Corps, as at present assigned to or engaged upon work in or in connection with such production.

Such person as shall at the time be chairman of the Aircraft Board created by the act of Congress approved October 1, 1917, shall also be the executive officer of said Bureau of Aircraft Production, and he shall be, and he hereby is, designated as Director

of Aircraft Production, and he shall, under the direction of the Secretary of War, have charge of the activities, personnel, and properties of said bureau.

II.

All unexpended funds of appropriations heretofore made for the Signal Corps of the Army and already specifically allotted for use in connection with the functions of the Signal Service as defined and limited by subparagraph (1) of Paragraph I hereof shall be and remain under the jurisdiction of the Chief Signal Officer; all such funds already specifically allotted or use in connection with the functions of the Aviation Section of the Signal Corps as defined and limited by subparagraph (2) of Paragraph I hereof are hereby transferred to and placed under the jurisdiction of the Director of Military Aeronautics for the purpose of meeting the obligations and expenditures authorized by said section; all such funds already specifically allotted for use in connection with the functions hereby bestowed upon the Bureau of Aircraft Production, as defined and limited by subparagraph (3) of Paragraph I hereof, are hereby transferred to and placed under the jurisdiction of said Director of Aircraft Production for the purpose of meeting the obligations and expenditures authorized by said bureau in carrying out the duties and functions hereby transferred to and bestowed upon said bureau; and in so far as such funds have not been already specifically allotted to the different fields of activity of the Signal Corps as heretofore existing, they shall now be allotted by the Secretary of War in such proportions as shall to him seem best intended to meet the requirements of the respective fields of former activity of the Signal Corps and the intention of Congress when making said appropriations, and the funds so allotted by the Secretary of War to meet expenditures in the field of activity of the Aviation Section of the Signal Corps are hereby transferred to and placed under the jurisdiction of the Director of Military Aeronautics for the purpose of meeting the obligations and expenditures authorized by said section; and the funds so allotted by the Secretary of War to meet the expenditures in that part of the field of activity of the Signal Corps, which includes the functions hereby transferred to the Bureau of Aircraft Production, are hereby transferred to and placed under the jurisdiction of the Director of Aircraft Production for the purpose of meeting the obligations and expenditures authorized by said bureau.

III.

This order shall be and remain in full force and effect during the continuance of the present war and for six months after the termination thereof by the proclamation of the treaty of peace, or until theretofore amended, modified, or rescinded.

Under this order Mr. John D. Ryan continued as Director of Aircraft Production and Maj. Gen. William L. Kenly became Director of Military Aeronautics.

This division of responsibilities and functions gave a clearer conception of the unique duties of the Air Service in production of planes and training of pilots, and is significant, too, of the many tactical reasons which made it imperative for England and France to establish separate and independent air services.

The end of the fiscal year found this problem of higher organization one of the most important to be faced. An early defect discovered in the reorganization developed when there appeared to be inadequate liaison between the Bureau of Aircraft Production and the Division of Military Aeronautics. One was responsible for the production of planes, the other for their operation and military efficiency. The method of selecting a type to put into production and the final decision whether any plane produced was suitable for its military purposes or not, was undetermined. The situation of two sets of officials with equal authority in their respective fields of action, neither responsible to the other, at once demonstrated that neither could be held for the final production of an acceptable plane for the front. This was partially obviated by an agreement between the Division of Military Aeronautics and the Bureau of Aircraft Production that the types of plane to be put into production must first be mutually agreed upon, and that before a plane could be sent to the front it should be given a military test and accepted by the Division of Military Aeronautics. But considerable time was lost before this policy was definitely arranged, a policy which might easily have at once been established by a unified department.

The personnel side of the air service, including the selection, training, organization, and operation of the flying forces, developed within the fiscal year 1917-18 into an educational system on a scale infinitely larger and more diverse than anyone had anticipated. Teaching men to fly, to send messages by wireless, to operate machine guns in the air, to know artillery fire by its bursts, and to travel hundreds of miles by compass, teaching other men to read the enemy's strategy from aerial photographs, and still others to repair instruments, ignition systems, propellers, aeroplane wings, and motors, has required a network of flying fields and schools, a large instructional force, and a maze of equipment and curricula.

None of this, practically speaking, was on hand at the outbreak of the war, neither fields, instructors, curricula, nor, more serious than all, experience to show what was to be needed. This country had never trained an aviator sufficiently to meet the demands of overseas aerial warfare and had not the slightest knowledge of the instruction necessary for radio, photography, or enlisted personnel. Consequently, the first men largely taught themselves before teaching others, and experience led on from one course to the next.

At first, in the point of need, was that of flying fields. Two were in limited operation at the outbreak of war, San Diego and Mineola; three more were selected, cleared, equipped, and made ready for flying in six weeks' time, and by the end of the year over a score were in operation all over the country. All were protected by a three-year lease with option to buy, if desired, at a fixed price. During the year also five supply depots, three concentration depots, three balloon camps, two repair depots, one experimental field, one radio laboratory, and one quarantine camp were built.

The selection of men for training as flyers was a complicated task, as the requirements were necessarily rigid. Volunteer examining boards of the highest medical skill were organized all over the country, 36 urban and 30 divisional boards, and a total of 38,777 men were examined to June 2, of whom nearly half, or 18,004, were disqualified. This naturally led to a high grade of personnel, and made the later training both more rapid and more efficient.

The first step in instruction was at one of the new "ground" schools opened on May 21 at the Massachusetts Institute of Technology, Cornell and Ohio State Universities and the Universities of Illinois, Texas, and California, with Princeton and the Georgia School of Technology added on July 5. Here, in eight weeks, under military discipline, the cadets were grounded in all the elements of aviation at a cost to the Government at first of $65 per pupil, and later $10 each for the first four weeks, and $5 weekly thereafter. By June 30, 1918, a total of 11,539 men were graduated to the flying fields and 3,129 were discharged for failure in studies, etc.

Next came the actual flying instruction, divided into two phases, primary and advanced. The former averaged about eight weeks, included ability to execute the simpler evolutions and cross-country flights, and led to an officer's commission and the right to wear the Reserve Military Aviator's wings. To June 30, 1918, 4,980 men had been graduated as Reserve Military Aviators for final training, and about 400 had been disqualified as incapable of becoming fliers.

The advanced training, however, presented infinitely more difficulties. It was not nearly so simple to teach the more complex stunts, formation flying, aerial machine gunnery, bombing, and night flying, while at the same time the highly specialized equipment necessary required considerable time for manufacture. Nevertheless, advanced schools of the three types necessary were opened toward the end of the year 1918, with what equipment was available, and had graduated 110 bombers, 85 bombing pilots, 464 observers, 389 observer pilots, and 131 pursuit pilots by June 30, 1918.

The ideal arrangement in mind at the end of the year was to train each pilot completely on this side of the ocean, where facilities are very good, supplies in abundance, and information and experienced pilots from the front available in ever-increasing numbers. The fliers can then be organized into provisional squadrons and wings and given training as large units with their own administrative officers and enlisted personnel so that they will be able to go immediately to the front, after a month or so of transformation work in France, learning geography and familiarizing themselves with new types of planes. Plans are under way looking to the establishment of such wings and brigades in the United States with the end in view of furnishing complete and fully trained units to the American Expeditionary Force.

The whole training program was considerably held up by lack of equipment. Obviously it required far less time to select men for training than to build the fields, planes, and accessories necessary to train them. Primary training planes, the only type manufactured here before the war, soon become available in increasing numbers, till by the end of the year more were on hand than needed. The advanced training planes, however, presented problems wholly new to this country, so that primary planes had to be fitted with more powerful engines and equipment and made to serve the purpose. The first 16 single-seater pursuit planes were not delivered till January, 1918, the first bombers till March, and the first gunnery late in May.

During this fiscal year a grand total of 407,999 hours were flown by Army aviators in the United States, as contrasted with 745.5 hours in 1914 and 1,269 in 1915. In the single week ending June 30, 1918, a total of 19,560 hours were flown, or 15 times, for that single week, the number for the whole year three years before. This, at 75 miles an hours, is equivalent to over 30,000,000 miles, or 1,223 times around the Equator.

During it there were 152 fatalities, or 2,684 flying hours and 201,000 miles flown to each death. Of these, 86 were caused by stalls, when the plane, usually through some error by the pilot, lost its flying speed and dropped into a straight nose dive or turned into a tail spin, from which the pilot did not have the time or the skill to extricate it. Collisions were responsible for 30 other accidents, often due to failure to fly according to the rules. Side-slips, the only other large cause of accidents, resulted in 10 deaths.

Regrettable as these accidents are, it is felt that, considering the newness of the science, the early state of development of the planes, the inexperience in instruction, and the necessity of teaching stunts in themselves rather dangerous, this number is not large. As a matter of actual statistics, fatalities in American training are less than half as large as those of the other allied countries.

Besides flyers, however, engineer officers to direct the upkeep of the equipment, supply officers to keep sufficient equipment on hand, and adjutants to keep the records and do other military work had to be especially trained. These men, absolutely essential to the maintenance of the Air Service organization, could be secured only after a detailed course of instruction. An engineers' school, opened for a 12 weeks' course at the Massachusetts Institute of Technology on January 12, graduated 590 men and discharged 228 before June 30; a supply officers' school, opened at the Georgia School of Technology, graduated 852 men and discharged 111 from an eight weeks' course before it was closed on May 11; and an adjutants' school, opened at Ohio State University on January 12, graduated 789 and discharged 97 men in an eight weeks' course before it was closed June 22.

A six weeks' course for armament officers and men to care for machine guns and bombs was opened at Fairfield, Ohio, on April 22, graduating 95 officers and 465 men by June 30, all of whom went forthwith overseas. Just at the end of the year a series of special schools in aerial gunnery were opened as the final step in the flyers' training in this country, graduating 102 pilots, 111 observers, and 101 fighting observers by June 30. Also a special course for compass officers was opened at Camp Dick, Tex., on April 10, with 53 graduates, and another course at the same time for a score of navigation officers.

Radio also required very special instruction, with courses and instructors for all flyers through the various stages of their progress, for the receiving force on the ground, and for the men responsible for the upkeep of the radio equipment. At the outset, volunteer civilians, each with his own methods of instruction, stepped into the breach, but by the end of the year two radio officers, and four enlisted men's schools were in operation with 49 and 329 graduates, respectively; radio officers and equipment had been sent to every field and ground school; and the courses for flyers had been standardized all the way through.

Aerial photography, which had developed during the war into an exact science, required similar triple instruction—that for observers to operate the cameras in the air, intelligence officers on the ground to interpret them, and enlisted men to aid in the developing, printing, and enlarging, and to keep the equipment in condition. Where the United States had not even a single aerial camera at the outbreak of the war, by the end of the year there had been opened on March 25 a large school for developers and printers at Rochester, N. Y., with 680 graduates by June 30, an officers' school on January 6 at Cornell teaching map compilation and interpretation, and photographic "huts" with complete personnel and equipment for instruction at each of the flying fields.

One of the most serious problems, and one of late development, was that of enlisted men, the ground force needed to keep the planes and engines always in prime condition, repair minor breaks, tighten up wires, strengthen struts, and make sure that no airman went up in a faulty plane. This was work wholly new to American mechanics, and of a delicacy and carefulness to which they were quite unaccustomed. Moreover, mechanics of the skill required had largely been drained off by the draft, by enlistment, or by other war industries.

Consequently, a whole series of schools was necessary. At first, in the fall small detachments of mechanics were sent to various factories—ignition, magneto, propeller, welding, instruments, sail-making, cabinet work, copper work, machine guns, and motors to secure as much experience as possible. While about 2,000 men awere being graduated from 17 courses at 34 different schools of this type, more fully worked out courses were established at five northern flying fields closed for flying during the winter. With 2,500 graduated here, still more detailed courses were opened at four large mechanics' schools, which

added another 5,000 men. By the end of the year two large and complete Government schools were in operation at Kelly Field, Tex., and St. Paul, Minn., capable of graduating 5,000 men every three months.

A noteworthy event of the year was the opening on May 15 of the first regular aerial mail service in the United States between New York, Philadelphia, and Washington. The Army furnished six planes and pilots, shortly doubled, for a daily round trip, carrying about 350 pounds of mail each way, and with a record of 50 minutes for the 90 miles between Philadelphia and New York, and 1 hour and 50 minutes for the 135 miles from Philadelphia to Washington. Ninety per cent of the trips were made successfully.

Another vitally important phase of the Air Service is that of ballooning, which during the war has been developing into a system of ever-watchful sentries on guard all the way from the North Sea to Switzerland. Less spectacular, perhaps, than the heavier-than-air work, this branch of the service has a quite indispensible function. The observer, swinging in a captive balloon at an altitude of a mile, 2 to 5 miles from the enemy's lines, and with a range of vision of 8 miles in all directions, can make a far more detailed, minute-by-minute analysis of the enemy's movements than the wider visioned but transitory aviator, and can maintain such a flow of minute information to the staff below that no important movement can take place unobserved within his view.

Here, also, at the outbreak of the war the United States was practically without facilities. The only school was at Fort Omaha, Nebr., recovered from complete abandonment the previous November, with accommodations for 15 officers and 400 men, and equipment of balloon shed, gas plant, two obsolete captive balloons, and some telephone material. The original program of August 13 necessitated a very large expansion, fully comparable to that in the heavier-than-air branch.

To meet the program the Fort Omaha school was enlarged in September to accommodate 61 officers and 1,200 men; on December 28 Camp John Wise was opened at San Antonio with a final capacity of 150 officers and 2,200 men, and special companies were sent to Fort Sill, Okla., for cooperation with the Coast Artillery. By June 30, 440 balloon officers had graduated, of whom 155 were fully qualified observers, and 73 had been sent overseas. The enlisted strength stood at 9,621 with 1,382 abroad.

Thus, by the end of the fiscal year, the Air Service had in operation an educational system complete in all the details necessary to man this intricate service. Fields, curricula, instructors, and equipment were on hand for the most diverse courses, and men were graduating in hundreds trained to all the difficulties of operating aeroplanes and translating their work into effective action. A total of 34,209 men had been graduated from the various courses, with 20,976 men enrolled in 50 schools of 16 different types.

Many outside bodies were called upon to cooperate in this development. Great Britain, France, and Italy all early established large aviation missions in Washington which brought their three years of experience to help solve problems confronted here for the first time. The National Advisory Committee for Aeronautics, the Bureau of Standards, and several joint Army and Navy Boards also added their information on the subject.

Nevertheless the work was carried out under extreme difficulties. Operation and production were not properly coordinated. Much time was lost in having to obtain the necessary authority to build a new field or secure increases in personnel, instead of being able to carry out a main program with full independence and authority. Moreover, experienced and trained personnel was lacking; work had to be done while the actual organization to do it was being built up; much time was lost in the expansion and moving about of offices in Washington, some half a dozen times; while officers were constantly being shifted between Washington, the fields, and overseas.

Meanwhile overseas, work of organization was similarly going on. Hardly six weeks after the United States entered the war, namely, on Many 27, the first cadets sailed for France for training in the highly developed French flying schools, till by the end of the year nearly 2,500 men were under instruction in France, England, Italy, and Canada. The collapse of Russia, Italy's serious defeat, and the weight thrown on the allied services made it impossible, unfortunately, for the allies to meet the schedule of training planes necessary, so that many of these cadets, the most promising of America's material, were in idleness for months. Nevertheless, what facilities were available greatly advanced America's aerial preparation and helped relieve the shortage of equipment here. It was early in May, 1918, however, over a year after America's entry into the war, that the first German plane fell victim to an aviator in the American service. About the same time 468 fully trained American aviators organized into 13 complete American squadrons or brigades with British and French squadrons were actually on the front, taking increasing toll of the enemy.

During the same time an enlisted force of 46,667 men had also been sent overseas. The first to go were sent to France to lay the foundations for the great organization soon to be built up, including training fields, assembly depots for American-built planes, and aerodromes near the front. Others were formed into service squadrons in England and France to be ready as soon as American pilots were trained into their own organizations. Still others went to relieve French skilled labor of unskilled work so that they could go back into aeroplane factories, while others went to England for the construction work necessary to carry out the night bombing program.

Consequently, by June 30, 1918, two large training organizations were in operation, the source of supply in this country training and organizing thousands of pilots and men in all sorts of tasks and the operation end overseas giving the final training in France, England, and Italy the fast moving fully trained squadrons to the front.

Where, at the outbreak of the war, there had been but 65 officers in the Air Service, there were now 14,230; the enlisted strength, similarly, had jumped from 1,120 to 124,767; the number of men in or awaiting training for flyers from less than 100 to over 18,000. There were 4,872 officers and 46,667 enlisted men overseas. Indeed, the Air Service alone was by June 30, 1918, larger than the American Army at the outbreak of the war. While its development had been infinitely more complicated and much less rapid than expected, there is reason to believe that it is essentially sound.

WILLIAM L. KENLY,
Major General, U. S. A.,
Director of Military Aeronautics.

The SECRETARY OF WAR.

(*Continued from page* 700)

A total of 2,676 pursuit, observation, and day bombing planes, with spare engines, were delivered to the Expeditionary Force by the French Government for the equipment of our forces overseas.

Considerable progress was made in the adaptation of other types of foreign planes to the American-made engines, and in the development of new designs. The U. S. D. 9A, embodying some improvements over the De Haviland 4, was expected to come into quantity production in the near future. The Bristol Fighter, a British plane, was redesigned to take the Liberty 8 and the Hispano Suiza 300 h.p. engines. A force of Italian engineers and skilled workmen was brought to America to redesign the Caproni night bomber to take three Liberty motors, and successful trial flights of this machine have been made.

Several new models are under experimentation. Chief of these is the Le Père two-seater fighter, designed around the Liberty motor, the performance of which is highly satisfactory. Several of these planes were sent overseas to be tested at the front.

Production of Service Engines

In view of the rapid progress in military aeronautics, the necessity for the development of a high-powered motor adaptable to American methods of quantity production was early recognized. The result of the efforts to meet this need was the Liberty motor—America's chief contribution to aviation, and one of the great achievements of the war. After this motor emerged from the experimental stage, production increased with great rapidity, the October output reaching 4,200, or nearly one-third of the total production up to the signing of the armistice. The factories engaged in the manufacture of this motor, and their total production to November 8, are listed in Table 21.

Table 21.—Production of Liberty motor to November 8, 1918, by factories:

Packard Motor Car Co.	4,654
Lincoln Motor Corporation	3,720
Ford Motor Co.	3,025
General Motors Corporation	1,554
Nordyke & Marmon Co.	433
Total	13,396

Of this total, 9,834 were high-compression, or army type, and 3,572 low-compression, or navy type, the latter being used in seaplanes and large night bombers.

In addition to those installed in planes, about 3,500 Liberty engines were shipped overseas, to be used as spares and for delivery to the Allies.

Other types of service engines, including the Hispano-Suiza 300 h.p., the Bugatti, and the Liberty 8-cylinder, were under development when hostilities ceased. The Hispano-Suiza 180 h.p. had already reached quantity production. Nearly 500 engines of this type were produced, about half of which were shipped to France and England for use in foreign-built pursuit planes.

Table 22 gives a résumé of the production of service engines by quarterly periods:

Table 22.—Production of service engines in 1918.

Name of engine	Jan. 1 to Mar. 31	Apr. 1 to June 30	July 1 to Sept. 30	Oct. 1 to Nov. 8	Total
Liberty 12, Army	122	1,493	4,116	4,093	9,824
Liberty 12, Navy	142	633	1,710	1,087	3,572
Hispano-Suiza 180 h.p.	...	...	185	284	469

Improvement in Instruments and Accessories

Few facilities existed for the manufacture of many of the delicate instruments and intricate mechanisms going into the equipment of every battle-plane. The courage and determination with which these most difficult problems were met and solved will form one of the bright pages in the archives of American industry.

One of the most important outgrowths of the research work which the war stimulated was the development of voice command in formation flying by means of wireless devices. The great significance of this invention will be appreciated when it is realized that the leader of a formation has heretofore been dependent on signals for conveying instructions to the individual units of the squadron.

Training of Personnel

After the declaration of war the constructoin of training fields proceeded with such rapidity that the demand for training equipment greatly exceeded the output. Since the latter part of 1917, however, the supply of elementary training planes and engines has been more than sufficient to meet the demands, while the situation as regards certain types of planes for advanced training has greatly improved. Approximately 17,000 cadets were graduated from ground schools; 8,602 reserve military aviators were graduated from elementary training schools; and 4,028 aviators completed the course in advanced training provided in this country. Pending the provision of adequate equipment for specialized advanced training, the policy was adopted of sending students overseas for a short finishing course before going into action. The shortage of skilled mechanics with sufficient knowledge of aeroplanes and motors was met by the establishment of training schools from which over 14,000 mechanics were graduated.

At the cessation of hostilities there were in training as aviators in the United States 6,528 men, of whom 22 per cent were in ground schools, 37 per cent in elementary schools. and 41 per cent in advanced training schools. The number of men in training as aviator mechanics was 2,154.

Forces at the Front

Early in 1918 the first squadrons composed of American personnel provided with French planes appeared at the front. The number was increased as rapidly as equipment could be obtained. On September 30,

THE FIRST AEROPLANE FLIGHTS—FIFTEEN YEARS AGO

The Wright Camp at Kitty Hawk, N. C., in 1903. *Wilbur Wright standing in front of building.*

The first flight, December 17, 1903, *Orville Wright at the helm; Wilbur Wright alongside of machine.*

The rail used to start the Wright flyer and the flyer at point where it landed in the flight of 59 *seconds, December* 17, 1903.

NAVAL and MILITARY AERONAUTICS

Key to Abbreviations

AAD—Assigned to active duty.
ABC—Report to Army Balloon School, Arcadia, Cal.
ABC—Report to Army Balloon School, Arcadia, Cal.
ADO—Report to Aviation Supply Depot, Dayton, Ohio.
ADT—Report to Aviation Supply Depot, Dallas, Texas.
AFO—Report to Aviation Supply Depot, Fairfield, O.
AGC—Report to Aviation Supply Depot, Garden City, L. I., N. Y.
AHT—Report to Aerial Gunnery School, Houston, Texas.
AIR—Transferred to the Air Service, National Army, without change in rank or date of commission.
ALF—Report to Camp Alfred Vail, Little Silver, N. J.
AMV—Report to Aviation General Supply Depot, Morrison, Va.
AOV—Report to School for Aerial Observers, Hampton, Va.
APR—Report to School of Aerial Photography, Rochester, N. Y.
ARV—Report to Aviation Supply Depot, Richmond, Va.
ASM—Report to Aviation Mechanics' Training School, St. Paul, Minn.
BFT—Report to Barron Field, Fort Worth, Texas.
BRN—Report to Bakers Field, Rochester, N. Y.
BST—Report to Brooks Field, San Antonio, Tex.
CAF—Report to Carlstrom Field, Arcadia, Fla.
CAP—Commissioned as Captain, Aviation Section, Signal Corps.
CDT—Report to Aviation Concentration Camp, Dallas, Texas.
CFT—Report to Carruthers Field, Fort Worth, Texas.
CGC—Report to Aviation Concentration Camp, Garden City, L. I., N. Y.
CGS—Report to Aviation Concentration Camp, Greenville, S. C.
CIT—Report to Radio School, Carnegie Institute of Technology, Pittsburgh, Pa.
CJS—Report to Camp Jackson, Columbia, S. C.
CJW—Report to Camp John Wise, San Antonio, Texas.
CLR—Commissioned as Colonel, Aviation Section, Signal Reserve Corps.
CMV—Report to Aviation Concentration Camp, Morrison, Va.
CPA—Commissioned as Captain Air Service, National Army.
CPR—Commissioned as Captain, Aviation Section, Signal Reserve Corps.
CRI—Report to Chanute Field, Rantoul, Ill.
CSO—Report to the Chief Signal Officer, Washington, D. C.
CUI—Report to School of Military Aeronautics, Cornell University, Ithaca, N. Y.
CWT—Report to Call Field, Wichita Falls, Texas
DAF—Report to Dorr Field, Arcadia, Fla.
DAP—Report to Director of Aircraft Production, Washington, D. C.
DIK—Report to Camp Dick, Dallas, Tex.
DIS—Honorably discharged from service.
DMA—Report to Director of Military Aeronautics, Washington, D. C.
ELA—Report to Eberts Field, Loanoke, Ark.
EOT—Report to Ellington Field, Olcott, Texas.
FLA—Commissioned as First Lieutenant Air Service, National Army.
FLR—Commissioned as First Lieutenant, Aviation Section, Signal Reserve Corps.
FLT—Commissioned as First Lieutenant, Aviation Section, Signal Corps.
FOB—Report to Fort Omaha Balloon School, Omaha, Neb.
FRF—On duty requiring regular and frequent aerial flights.
FSO—Report to Fort Sill School for Aerial Observers, Fort Sill, Okla.
GIT—Report to School of Military Aeronautics, Georgia Institute of Technology, Augusta, Ga.
GLC—Report to Gerstner Field, Lake Charles, La.
HHN—Report to Hazelhurst Field, Mineola, L. I., N. Y.
JMA—Rated as Junior Military Aviator.
JRC—Report to Jackson Field, Riverside, Cal.
KST—Report to Kelly Field, So. San Antonio, Tex. (When specified in the order, the number of the field is given in parentheses)
LDT—Report to Love Field, Dallas, Tex.
LHV—Report to Langley Field, Hampton, Va.
MAC—Report to March Field, Allesandro, Cal.
MAJ—Commissioned as Major, Aviation Section, Signal Corps.
MAT—Report to Mather Field, Sacramento, Cal.
MDO—Report to McCook Field, Dayton, Ohio.
MIA—Report to U. S. Naval Air Station, Miami, Fla.
MIT—Report to School of Military Aeronautics, Massachusetts Institute of Technology, Boston, Mass.
MJA—Commissioned as Major Air Service, National Army.
MJR—Commissioned as Major, Aviation Section, Signal Reserve Corps.
MSC—Report to Radio School, Maryland State Agricultural College, College Park, Md.
OBS—Attached to the Aeronautical Service as Observers.
OSU—Report to School of Military Aeronautics, Ohio State University, Columbus, Ohio.
PFO—Report to Post Field, Fort Sill, Okla.
PMT—Report to Park Field, Millington, Tenn.
PUP—Report to School of Military Aeronautics, Princeton University, Princeton, N. J.
PWM—Report to Payne Field, West Point, Miss.
REL—Relieved from present duty.
RSD—Report to Rockwell Field, San Diego, Cal.
RTR—Retransferred to organization attached to previous assignment to aviation duty.
RWT—Report to Rich Field, Waco, Tex.
SBI—Report to Scott Field, Belleville, Ill.
SAG—Report to Souther Field, Americus, Ga.
SGS—Report to Camp Sevier, Greenville, S. C.
SLA—Commissioned as Second Lieutenant Air Service, National Army.
SLR—Commissioned as Second Lieutenant, Aviation Section, Signal Reserve Corps.
SLT—Commissioned as Second Lieutenant, Aviation Section, Signal Corps.
SMA—Report to School of Military Aeronautics, Cambridge, Mass.
SMM—Report to Selfridge Field, Mount Clemens, Mich.
SRC—Report to Columbia School for Radio Officers, New York City.
TFT—Report to Taliaferro Field, Fort Worth, Texas. (When specified in the order, the number of the field is given in parentheses)
TMA—Report to Taylor Field, Montgomery, Ala.
UCB—Report to School of Military Aeronautics, University of California, Berkeley, Cal.
UIU—Report to School of Military Aeronautics, University of Illinois, Urbana, Ill
UTA—Report to School of Military Aeronautics, University of Texas, Austin, Tex
VBW—Report to Vancouver Barracks, Washington.
WAC—Report to Aviation Concentration Camp, Waco, Tex.
WCS—Wire to the Chief Signal Officer upon arrival.
WDM—Wire, Director of Military Aeronautics, upon arrival.
WFO—Report to Wilbur Wright Field, Fairfield, Ohio.

Notes

Note 1—Report to places mentioned in order named for temporary duty.
Note 2—Report to Air Service Headquarters, Fayetteville, N. C.
Note 3—Report to Air Service, Detroit, Mich., to the officer in charge.

FOREIGN NEWS

France Projects Aerial Lines

Paris, Nov. 17.—The French Government is contemplating the creation of about twenty aerial lines connecting Paris with the chief towns of France and the great foreign centers.

British Machines in German Hands

As an indication of the types of machines used by the British last summer, the following official list published in Germany is of interest. It shows a total of 136 British machines which the Germans claim as having fallen into their hands on the Western Front during the month of July, 1918:

(Single-seaters) 40 Sopwith Camels; 27 S.E. 5s; 14 Sopwiths; 9 Sopwith Dolphins; 1 D.H. 5. (Two-seaters) 20 D.H. 4s; 5 D.H. 9s; 14 B.F.s; 1 Sopwith; 1 F.E.; 1 R.E. and 1 Bristol. Also "a large fighter," which evidently the Germans failed to idenify, and 2 Handley Page bombers.

Norwegian Aircraft Company

The Bergens Tidende states that a company is being formed at Christiania, the "A/S Mekanisk Teknisk Industri," its object being, among other things, the manufacture of frames and other woodwork for aeroplanes. The Director of Military Aeroplane Factory, Captain Sem-Jacobsen, is to be the company's technical adviser and factory manager. The offices will be at Christiania, but a piece of land at Strommen has been secured for the building of the factory. The company's capital is fixed at Kr.350,000, a large portion of which is already subscribed.

Aeronautical Development in Japan

With his usual far-sightedness our Eastern Ally, Japan, has quickly realized the necessity for preparedness in matters aerial. The Prime Minister was recently a guest at a luncheon with Baron Sakatani and General Nagaoka, the respective vice-presidents of the Imperial and National Aviation Associations, and a large company of bankers and other men of affairs, who met in order to form a combined national association to secure the widest financial help for an effort to raise aviation in Japan to the level of other countries.

Air Traffic in Germany

London (British Wireless Service.)—Air traffic has been begun between some of the largest German towns, advices reaching here report. The aeroplanes are carrying parcel post matter and passenges. The fare per passenger is 2½ marks a kilometer, or about 94 cents a mile.

The machines can fly at the rate of eighty miles an hour, and the journey from Berlin to Munich, for instant, can be accomplished in four and a half hours.

One company is constructing a new, large type of aeroplane, able to carry forty passengers.

Huge German Plane for Ocean Flight

London.—The Berlin correspondent of *The Daily Express* telegraphs descriptions of a visit he paid to a German aircraft factory at Staaken, in the suburbs of Berlin. He says an aeroplane for a transatlantic flight which is now under construction there will have a wing spread of 198 feet and engines developing 3,000 horse power. The correspondent also learned that an airship for a transatlantic flight which is being built at the Zeppelin factory at Friedrichshafen has nine engines, eight propellers, and will carry a hundred passengers.

If the international situation clears, the first flight will take place in July. The voyage is expected to last forty hours.

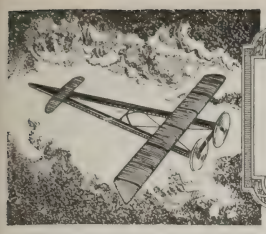
At Staaken the correspondent saw great aeroplanes of the type used in bombing raids on London and Paris. They have five motors, each developing 250 horse power and driving five propellers. They have a wing spread of 140 feet, carry eight men and 2,840 pounds of bombs, and can fly fourteen hours at a speed of 81 miles an hour. The correspondent adds:

"Hardly was the armistice ink dry, when the workers at Staaken began in feverish haste to transform raiders into commercial machines. I saw men tinkering and hammering to turn them into passenger-carrying aeroplanes to link up all European capitals with Berlin. I saw dozens of fighting machines, all built of aluminium, being transformed for the postal service.

"Going into the airship department, I learned details of a remarkable Zeppelin flight which took place last year. At 8 A. M. on November 21 a Zeppelin, with a crew of twenty-two, carrying twenty-five tons of munitions and medicines, left Jamboli, in Bulgaria, for German East Africa. On the night of November 22-23 the airship was over Khartoum, when it received a wireless message from Nauen ordering it to return, because Berlin had learned through a Reuter dispatch that the majority of von Letton-Worbeck's troops had surrendered. The airship returned and came to anchor at Jamboli at 8 A. M. on November 25. The ship, says Herr Rasch, managing director of the factory, was capable of going from Berlin to New York and returning without a stop."

Plane to Carry 100 With Cabin and Beds

Rome, December 8.—Gianni Caproni, interviewed by a New York *Times* correspondent about the prospect of continuing the development of aviation now that the war is over, said:



"The war has served to reveal the practical importance of aviation and to hasten its technical perfection. Italy especially, owing to its geographical formation, will benefit immensely by it to communicate with the Dalmatian Islands, Africa, and the Near East. The aeroplane must also become like the transatlantic steamers and serve as a means of worldwide commerce.

"With a triplane we can already transport thirty persons and a heavy cargo. I am building a triplane which will accommodate a hundred passengers with all modern comforts, cabins and beds. When sufficient planes have been built to form a flotilla, I shall sketch out an itinerary for each one to take. For the present we cannot transport third-class passengers owing to the expense of the journey.

"One of the chief aims of aviation will be transportation of mail and merchandise. Journalism will gain immensely by this quick means of transportation, the newspapers of Rome being distributed almost at the same time in Naples as in the capital. We are positive of important results, but think that others will follow that will be even more important."

French Caudron Biplane equipped with two Hispano-Suiza motors

ELEMENTARY AERONAUTICS *and* MODEL NOTES

By John F. McMahon

The Ford Motored Aeroplane and Its Construction

AS we start to construct our light horse-powered tractor I might call attention to the fact that the aeronautic industry is waking up to the need of the small light horse-powered machine and we have started none too early. At the present time five light machines are being constructed by different manufacturers, three of them with Ford motors.

Before going further I might inform the readers that the machine will be described as fully as the space of this page will permit. This may not be sufficient for the less experienced reader, or for the great number of persons who have sent in requests for full plans and drawings of the Ford machine.

So to help those persons who have sent in requests, and for those who might not be able to get all the information from this page the writer has drawn up a full set of blueprints which sell for a small sum.

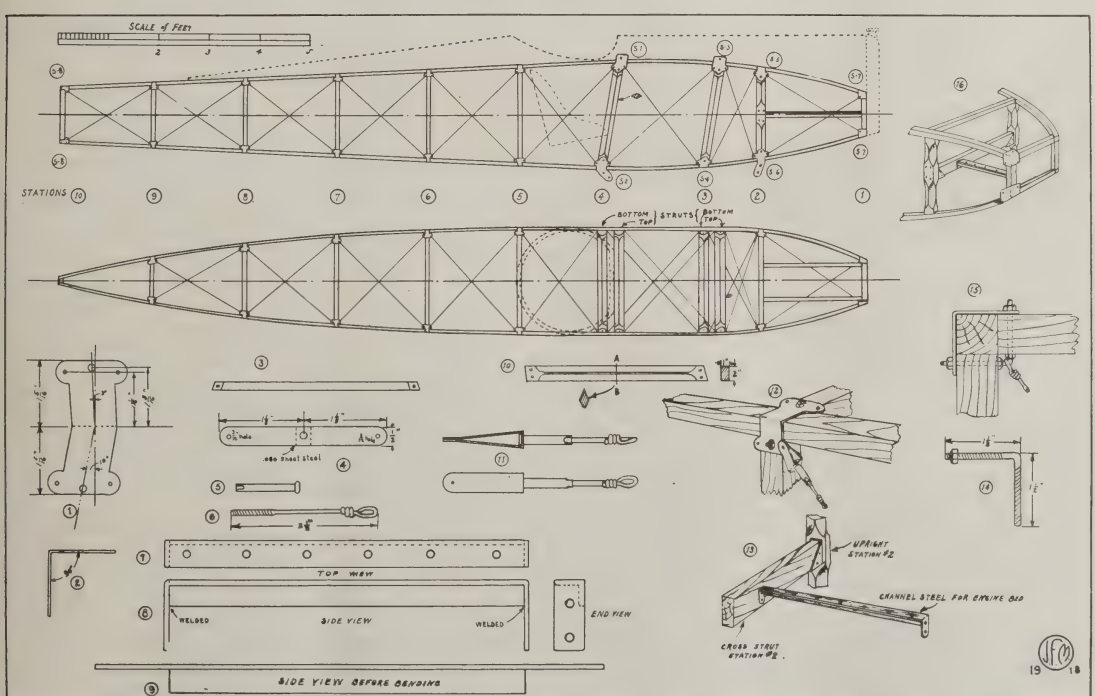
The body is 16 feet long and the scale given at the upper left hand corner should assist in correctly laying out the machine. When making the struts, if the builder would make a pencil mark at the center of the strut, it would be easy to line up the machine later.

It was my idea to place the radiator over the engine, but after checking up I find that for ease in building and greater efficiency the radiator is best placed in front.

The body should be laid out first. The longerons are made from a 9 ft. strip of ash and a 9 ft. strip of fir. These pieces are joined together at a small distance behind the pilot's seat. To join them it is necessary to taper each piece. The taper being 18" long. These tapers are then placed together, glued, and wrapped with 1½" wide silk ribbon. The ash should be placed at the forward end of the machine on account of the added strains occurring at this point. The weight of these longerons should not go over 11 pounds.

The struts to the rear of the pilot's seat are made ⅞" fir. When cutting these struts take care to have the ends at the correct angle at which they meet the longerons. (See Figure 3.) The struts forward are made of ash 2" x 1". The ends are left square but the inner portions are made of a sort of diamond shape, for lightness, as shown. The struts must not weigh over 13 pounds for the lot. An engine bed made of angle steel or iron, ⅛" thick and 1" deep on each side, is then fastened in place. These two strips are made as shown in Figures 7, 8 and 9. Figure 9 shows the piece before the ends are bent down and welded. Holes can be drilled at distances to equal the holes on the Ford cylinder block, where the oil pan fastens in place.

Figure 15 shows the method of fastening the rear struts in place. These fittings are made from a piece of .050 sheet steel as shown in Figure 1. When made they are bent along the dotted line to the shape as in Figure 2. Note that the angle of the bottom portion of the fitting changes to meet the angle of the longerons in the top view of the fuselage. The top portions do not change from 3 degrees off center.



The angle bolt is made from ⅛" drill rod bent to a 90 degree angle and threaded at each end almost to the bend as shown. If a regular 32 die is used, nuts to fit can be purchased. Figure 12 shows the method of fastening the brace wires and turnbuckles.

Turnbuckles are made from 105 gauge mortorcycle spokes as shown in Figure 11. The strap is .050 sheet steel ½" wide and bent to the proper shape.

When bracing the body note that wires are left out of the top section where the pilot's seat is placed, and also the cross bracing in front where his legs will protrude.

The body is laid off and different stations noted, as shown in the circles, starting at one from the nose of the machine and ending at ten to the rear. In the future these points will be known as Station 6, etc.

The circles having the numbers S-1, S-2, etc., are given to show the number of special fitting which will be shown in later drawings.

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

The Aviator

On giant wings he rises from the ground,
And in ascending quickly circles round,
'Ere climbing up into the ether blue,
Where in fleecy clouds he seems lost to view,
But to appear then disappear again,
'Til but a tiny speck he does remain
On the horizon, when at last all sight
Of him is lost; so rapid is his flight.

'Tis wonderful how in the divine plan,
The power to create is given man,
How he with lofty thoughts and objects high
Has achieved his purpose which was to fly
Like a bird, and to travel through the air,
Penetrating through banks of mists to where
The earth would disappear; then wing his flight
To where it pleased his fancy to alight.

But the birdman who was at first content
To fly for pleasure, has his mind now bent
On winning honors in the Flying Corps,
In which he's aiming as an Ace to score.
And to be classed with those "Knights of the Air,"
Who in Freedom's name all things do and dare,
And if need for Country and Flag to die,
Like them in a last battle in the sky.

ROSE VILLAR, 550 West 184th St., N. Y. City.

THE PREHISTORIC FLYING CORPS.

Synonymous Anyhow

Editor Plane News: Will zee monsieur be so kind as to tell me the American meaning of the word "bull"?—*Pvt. Frenchie.*

Dear Frenchie: The word is very hard to explain thoroughly without concrete example. To give you a vivid illustration we quote the words of Hun Hindenburg: "The war will be over before America can create an effective army!" Compree, Frenchie? Get the idea? Bull, Frenchie, is making people think something is that ain't and were but are not.

The Air Is Best

Hart Jenks, Kelly Field, Texas

Each living thing holds in its heart,
  Away from all the rest,
Some most loved joy, a thing apart;
  In mine, the air is best.

The lean wolf haunts his hunger-trail,
  The wren goes to her nest,
And I, through flame-bathed cloud
    fields, sail;
  For me, the air is best.

For you the noise, the joust, the grind,
  The city on her quest;
For me a ship astride the wind—
  For me, the air is best.

I've seen the glory of the plow,
  And growing things I've blest,
But ah, the air is calling now,
  Oh dear; the air is best.

I want no harvest labor yields,
  Of laughter, seek not zest,
Or love, the mighty sword it wields
  For me, the air is best.

Piled deep and free my dawn-cloud
    waits,
  In blazing brilliance drest,
To lure through the rose-love gates,
  Ah yes—the air is best.

Air Ditty

Aeroplane grown weary
Of return to earth that's dreary,
Vagabonds in the air
Serenading any star that's fair,
And from each like a troubadour
Rollics away as before.

Sometimes a minstrel star
Wanders forth from afar,
And passing by
Sings in the sky,
Cantatrice improvisatore
Like my aeroplane troubadour.

The chauntress wind grows fantastic
To prove her scale reach elastic.
When the wind gets that way
The plane must stop play
And seek the earth
To prevent the stars from mirth
At his antics.

—Robert M. McAlmon.

BOOKS ON AERONAUTICS

Christmas Presents for Boys Overseas Must be Mailed This Month. Send Him Books and Magazines and He Can Share Them with His Squadron

Book: starred out of stock. Editions importing.

TEXT BOOKS

Aeroplane Construction & Operation, Rathbun. $2.00.
Practical Aviation, Hayward. $3.75.
The A-B-C of Aviation, Pagé. $2.50.
Aeroplane Construction & Assembly, Leslie & King. $1.50.
Textbook of Naval Aeronautics, by Henry Woodhouse. $6.00.
Textbook of Military Aeronautics, by Henry Woodhouse. $6.00.
Practical Flying, by McMinnies. $1.50.
Aviator's Elementary Handbook, by A. DeGuiche. $1.00.
Manual of Army Aeronautics, 60c.
D'Orcy's Airship Manual. $4.00.
Manual for Aero Companies, Satterfield. $1.00.
****Air Navigation for Flight Officers***, by A. E. Dixie, R. N. $4.00.

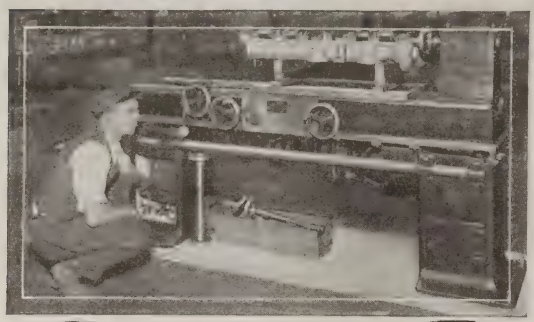
(Continued from page 722)

the date of the latest available information, there were 32 squadrons at the front; of these 15 were pursuit, 13 observation, and 4 bombing. The first squadron equipped with American planes reached the front in the latter part of July.

Losses in Battle and in Training

Though the casualties in the air force were small as compared with the total strength, the casualty rate of the flying personnel at the front was somewhat above the artillery and infantry rates. The reported battle fatalities up to October 24 were 128 and accident fatalities overseas 244. The results of Allied and American experience at the front indicate that two aviators lose their lives in accidents for each aviator killed in battle. The fatalities at training fields in the United States to October 24th were 262.

Commissioned and Enlisted Strength



On America's entrance into the war, the personnel of the Air Service consisted of 65 officers and 1,120 men. When the armistice was signed the total strength was slightly over 190,000, comprising about 20,000 commissioned officers, over 6,000 cadets under training, and 164,000 enlisted men. In addition to the cadets under training, the flying personnel was composed of about 11,000 officers, of whom approximately 42 per cent were with the Expeditionary Force when hostilities ceased. The Air Service constituted slightly over 5 per cent of the total strength of the Army.

Secretary Baker's report included a communication just received from General Pershing in which he commented on aircraft and the Air Service as follows:

"Our entry into the war found us with few of the auxiliaries necessary for its conduct in the modern sense. Among our most important deficiencies in material were artillery, aviation, and tanks. In order to meet our requirements as rapidly as possible, we accepted the offer of the French Government to provide us with the necessary artillery equipment.

"In aviation we were in the same situation, and here again the French Government came to our aid until our own aviation program should be under way. We obtained from the French the necessary planes for training our personnel, and they have provided us with a total of 2,676 pursuit, observation, and bombing planes. The first aeroplanes received from home arrived in May, and altogether we have received 1,379. The first American squadron completely equipped by American production, including aeroplanes, crossed the German lines on August 7, 1918.

"It should be fully realized that the French Government has always taken a most liberal attitude and has been most anxious to give us every possible assistance in meeting our deficiencies in these as well as in other respects. Our dependence upon France for artillery, aviation, and tanks was, of course, due to the fact that our industries had not been exclusively devoted to military production. All credit is due our own manufacturers for their efforts to meet our requirements, as at the time the armistice was signed we were able to look forward to the early supply of practically all our necessities from our own factories."

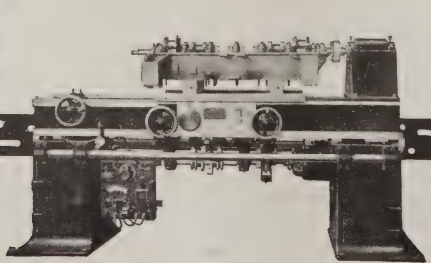
Balancing Franklin Automobile Crankshafts

Finding the running balance of crankshafts has been such a difficult and expensive operation that only a few of the highest class automobile manufacturers have seriously attempted it in the past.

The above illustration shows how the Franklin Automobile Company now accomplish this in their Syracuse plant.

Heretofore *exact* results were merely "approximated" and then only by a near genius with a sixth sense who used much valuable time by the cut-and-try method.
With the

CARWEN
Dynamic Balancing Machine
(ARCHOFF PATENTS)



and ordinary shop skill they can now put 100 crankshafts in precise running balance—not mere static balance—in an 8-hour day.

Similar results are being obtained by manufacturers of airplane engines, steam turbines, electric motors and other machines having rapidly rotating parts that require exactness of running balance.

The cost of purchasing and operating a Carwen is negligible as compared with the gain in output and increased efficiency of your product. Made in sizes suitable for balancing objects up to 15,000 lbs.

Write for copy of our illustrated booklet that explains principle and operation.

Address:

Samuel J. Shimer & Sons, Inc.
Milton, Pa.

(*Continued from page* 704)

The newly appointed pilots are Leon D. Smith, Carl B. Smith, Ira O. Biffle, Trent C. Fry, Dunn K. Steel, Dan Davison, Wm. W. Harrison, Edwin W. Hubbard, C. C. Eversole and D. I. Lamb. Eversole, Lamb and Hubbard are Americans and were attached to the Royal Flying Corps. The others are experienced fliers and instructors. The emergency pilots are Christopher C. Cole, Julian Sykes, Edgar F. Waters and Wm. Lindley.

Mechanics and mechanics helpers were employed as follows: Mechanics: Wm. L. Bramer, Chas. W. Denn, Jr., Joseph J. Brucato, Wm. C. Burmeister and T. E. Ilch. Helpers: Harold T. Dwyer, Joseph E. McConnell, Wm. H. Kitchen, Chas. B. Chamberlain and Stanley Oberly.

Capt. Lipsner Resigns

On December 6th Capt. Benjamin B. Lipsner resigned as Superintendent of the Aerial Mail Service. His letter, and Postmaster Burleson's acceptance, in full, will be found on another page of this issue.

An announcement of the reorganization of the Aerial Mail Service was made by the Post Office Department. This reorganization included the abolishment of Captain Lipsner's office of Superintendent of the Aerial Mail Service and the creation instead of two main sections—one on maintenance and equipment and the other on flying operations. First Lieut. J. Clark Edgerton, who was in the Aerial Mail Service during its operation by the army authorities and who has since been on testing and flying work in Bolling Field, has resigned from the Army and is appointed to take charge of flying operations of the Mail Service. He is a son of James A. Edgerton, Purchasing Agent for the Post Office Department, and is only twenty-two years old. Before he was engaged on recent testing work he flew mail planes between Washington, Philadelphia, and New York. Dr. L. T. Bassler, who served with General Pershing's staff in Mexico and subsequently as adjutant and instructor in the West Virginia Flying Corps unit, which went to France, is given the position of Chief of the Maintenance and Equipment Section. The change becomes effective immediately.

First Aerial Weather Forecast

Washington, Dec. 2.—The first official aerial weather forecast was made public to-day by the Weather Bureau in co-operation with the Aerial Mail Service of the Post Office Department.

"New York to Cleveland: Cloudy 8 P. M. Snow near Lake Erie. Winds moderate, northwest to north-northwest east of the Alleghenies up to 6,500 feet and moderate south winds west of Alleghenies, shifting to west-southwest at about 1,500 feet. Forecast: Snow to-day (Monday), with increasing northeast to north winds up to about 6,000 feet, backing to strong northwest above."

It is intended to extend the forecast for all the territory from New York to Chicago by December 15, by which time it is expected the Aerial Mail Service between these cities will be inaugurated.

Charles N. Kight Talks on Aero Mail Advantages

Extension of the air mail service throughout the country, using aviators and aircraft returned from overseas, was predicted by Charles N. Kight, aero mail division of the Post Office, at the weekly luncheon meeting of the Philadelphia Engineer's Club.

Urging Philadelphians to make more use of the aero mail service between this city, Washington and New York, the speaker declared time would be saved at an increase of but three cents over the present cost for special delivery mail. Aero mail, he declared, practically is in flight from the moment a letter is mailed.

Aero mail takes precedence over all other mail and immediate delivery is guaranteed upon its arrival at its destination. The cost of sending a letter to either Washington or New York by air craft is 16 cents. A special delivery letter would cost 13 cents and delivery would not be nearly so prompt.

Congress is to be asked for an added appropriation of $100,000 for the establishment of an air mail service between Washington and Chicago. Three hundred thousand dollars is to be asked for the maintenance of the aero mail service for the ensuing year. Use of the big air craft now overseas will, the speaker declared, cover the Washington-Chicago run in six and one-half hours.

"From June 15th up to the present time," said Mr. Kight, "since the Post Office has had absolute control of its pilots, we have made 100 per cent. flights, with but one slight mishap. Our pilots have covered 69,000 miles and have carried within that time 2,700,000 letters.

"Two hours and thirty-eight minutes is the time for our aero mail service between Washington and New York, and remember, we have to contend with the best rail service in the country for that distance. Using overseas aeroplanes this time can be reduced, for the larger craft will fly 150 miles an hour while the ones now used average but 100 miles.

"Support the aero mail service and thereby aid, through policing the air, in the protection of the country. Within a year and a half I venture to predict, both mail and passengers will be carried by air craft all over the country.

"The air mail service is here to stay. It is a permanent service established by the Government. Public patronage is demanded for the public good." Mr. Joseph A. Steinmetz declared it necessary that the country care for its thousands of returning aviators.

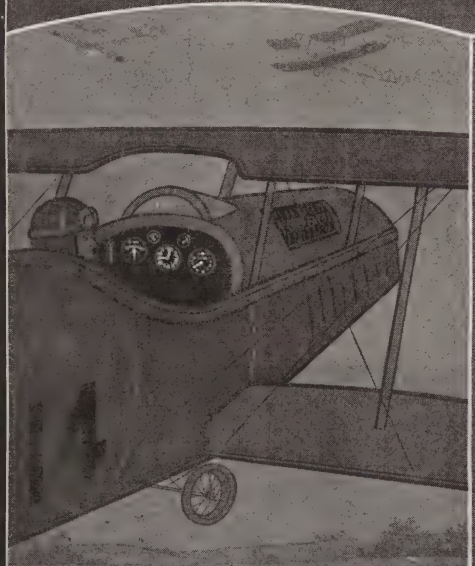
"There are thousands of men and aeroplanes overseas," he declared. "The aeroplane is here to stay. We have seen it grow from the fragile fabric of a dream of steel and canvas. The world held its breath when men flew 1,000 feet in air. Today they fly at a height of five miles and in the Polar currents. The upper air currents are now being plotted by daring aviators in anticipation of transatlantic flights.

"To gain supremacy in air it is necessary that we subsidize our mail fleet. I have sent scores of letters to our boys overseas and have found that they reached there three weeks ahead of the regular sail deliveries.

"Great air expeditions are being organized these days. Sea planes, such as the great craft used by the Navy, are being organized to fly up the mouth of the Amazon and to the headwaters in the Andes. Bases will be established every 300 miles. Rubber, mica, the tungsten groups and other rare minerals, all will be brought out by aeroplane. Gold will be brought out by the ton from far-off Siberia through this latter day mode of transportation."

With victory looming in the eastern skies, be it remembered that

PARAGON PROPELLERS



built and based on efficiency, are with the winning forces. In the fight for democracy our product is Ace High. Four plants. Total floor space 164,132 ft.

WE USE THE CELEBRATED

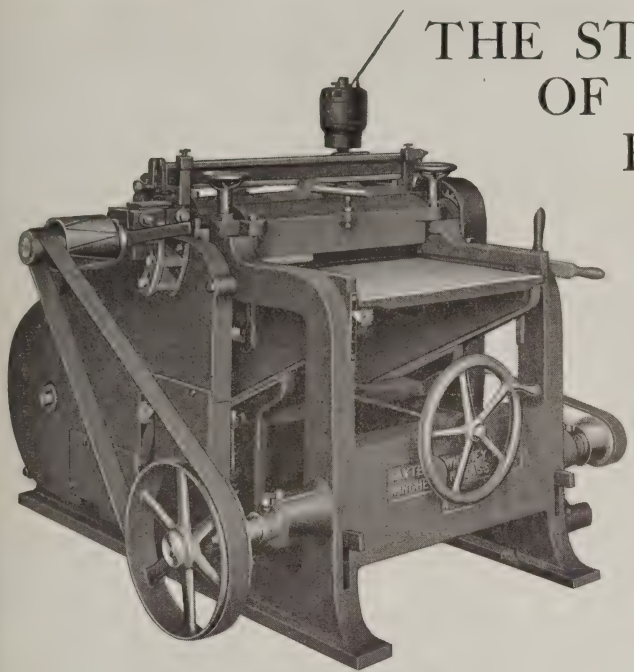
LUMA RADIUM **Radium Luminous Compound**

Perfect Workmanship and Superior Luminosity

Our dial painting factories are conveniently located and properly equipped to serve promptly and in the best possible manner, manufacturers of aeronautic instruments.

Our service eliminates the expense of experiments and assures satisfactory results from the start. We use Luma exclusively because of its dependability and demonstrated superiority.

Luma is guaranteed to contain only Radium as its activating agent, no Mesothorium, Radiothorium, Ionium nor Polonium being added.



Estimates and full information upon request.

THE STRONG POINTS OF WHITNEY PLANERS

appeal to every wood-worker, such as a

RIGID FRAME with ample weight of metal—

BED raised and lowered on Solid Wedges operated on wide tracks—

HARDENED CENTER TABLE made extra thick—

AUTOMATIC CHIPBREAKER working concentric with the Cutter Head—

CLAMP CUTTER-HEAD BOXES easily removed from the machine—

CUTTER HEAD with long bearings of large diameter.

These are but a few of the features that enable Whitney Surfacers to do superior surfacing at the lowest cost.

THE NATIONAL TECHNICAL AND TRADE AUTHORITY

THE EDITORIAL CONTENTS

Printing the largest amount of editorial material, the editorial contents of AERIAL AGE include:

1. Editorials presenting always constructive suggestions concerning the substantial upbuilding of the American aeronautic industry.
2. Comprehensive and complete Trade and General news of the week from every point of the compass.
3. Technical contributions from leading authorities in the aeronautic world on aeroplanes, aero-motors and every other phase of aeronautics.
4. The complete official reports of the Army and Navy Air Services and published weekly together with articles by authorities on Military and Naval aeronautics, thereby insuring to the readers and advertisers a more complete representation of Army and Navy aeronautics than is afforded by any other publication in the United States.
5. A regular department presenting each week some important phase of military aerostatics, being the only magazine in the world to have such a department.
6. Complete reports concerning current aeronautic standardization work here and abroad.
7. Personal notes concerning the men upbuilding the aeronautic industry's affairs.
8. A digest presenting important events of the air services on the war fronts.
9. A page every week for the model enthusiast, giving views of the clubs and construction information.
10. A specially appropriate department in the French and English languages, giving valuable information and table, which our men who go overseas find most advantageous.
11. Last, but not least, a page of aeronautical humor in verse, prose and illustration.

ITS CLIENTELE—AERIAL AGE is read:

1. By **the Executive Heads** of every aeronautical concern in the country who relies upon its contents to inform him concerning the constantly increasing progress of the aeronautic industry.
2. By **the Executive, Engineering and Purchasing Military Authorities** of the United States and the Eighteen Allied Countries, and nine Latin-American countries who have severed their connections with Germany.
3. By **the Engineer** who looks upon it as the medium of information concerning every development of technical importance.
4. By **the Designer** who is made familiar with current progress throughout the world by articles, illustrations, and diagrams contributed by the world's technical experts.
5. By **the Purchasing Agent** who, in its advertising pages, finds a directory which gives the best and the latest products of the aeronautic industry.
6. By the Capitalist and progressive business men who recognize the fact that aeronautics, now one of the key industries, who look to AERIAL AGE for the opportunities afforded by the aeronautic industry, and to AERIAL AGE'S Service and Advisory Department for advice regarding investments.
7. By the Air Service Student who acquires a broad knowledge of what is happening in the Air Services in the United States, and Europe, and for whom we print special articles in French describing the machines with which he will require to become familiar.
8. By the Layman interested in aeronautics, who desires to be kept constantly and correctly informed on the current developments in the Aeronautic Industry and Movement.
9. By **the Juvenile Student** who is interested in model construction and for whom we print special articles of informative value. He will be the expert and the purchaser of the near future.

Liberty Starter

Approved and Now Being Made For U. S. Naval Hydroplanes

Weight, 49 pounds complete.
Cranks motors up to 500 horsepower.
The device itself weighs but 30 pounds.
It is entirely self-contained without brackets or other gearing, bolting direct to crankcase of engine, and cranking direct to end of crankshaft.

A small air cylinder, 1¼" x ¾" with piston running continuously for air pressure on gasoline feed tank is combined with the device and entirely independent in action. This starter furnished with or without it at option.

LANGLEY FIELD
May 15, 1918

Information regarding these trials given on request.

THE simplicity and reliability of the Liberty Starter for Airplanes are due to the fact that compressed air, the most reliable and easily controlled motive force known, is the actuating energy.

Where chances of starter trouble cannot be taken, as, for instance, on naval seaplanes, this type of starter is equipped. Liberty Starters have been thoroughly tested by the U. S. Navy, and are used on U. S. Naval Planes. (See list of tests made.)

The Liberty Starter is an air motor for starting, and a compressor to store air for its own energy in starting. It is entirely self-contained; couple direct to end of crankshaft of motor; needs no alteration in motor or gear reduction, and has ample power for magneto starting. It is the *one* efficient, *dependable* type of starter for airplanes to-day.

We welcome comparative tests, and will gladly arrange for any kind of trial for the Liberty Starter.

Hess-Bright Ball Bearings

An "Ace" they call him—

because he has conquered his enemies again and again in battles of the sky.

Much of his success is due to quick turns—sudden nose-dives and dangerous tail-slides. All are accomplished because he has the necessary nerve and the detailed knowledge to use the powers of his mount to his advantage.

Yet that turn, slide or dive would have been disastrous unless the bearings in his motor had proven-known-tested values.

That's why Hess-Bright Ball Bearings are the logical choice where severe punishment is simply hourly duty. They, too, are the "aces" of their field. For they have overcome all bearing problems.

HOW TO EFFICIENTLY USE THE 20,000 LIBERTY MOTORS

By G. DOUGLAS WARDROP

WHILE I was in Detroit addressing the Society of Automotive Engineers, I received a large number of requests for information as to what the prospects are of using the twenty thousand Liberty Motors which will have been produced when production on present contracts is completed. I have since taken up the matter with the Government and aeronautic authorities and this investigation has lead to defining clearly the immediate prospects of the American aeronautic industry and American aeronautics in general. The result of this general inquiry, together with the prospects explained in Detroit, are being summarized herewith. The result of our inquiry shows that not only the twenty thousand Liberty Motors can be put into use during the coming eight months, but there will actually be a demand for as many more motors of different types.

This statement is based on facts. Knowing exactly what still remains to be done for national aerial preparedness, we know, for instance, that besides maintaining the Army, Navy, and Marine Corps, we still have to establish Naval and Military Air Stations in the United States and its territories, and that hundreds of aircraft are needed for our coast defenses, which have never had aircraft.

AERIAL AGE has published the reports of the Secretary of War, General Kenly, and the Navy Department, which tell exactly the aeronautic program needed for our national defense.

We have printed articles showing the extensiveness of the aerial mail plans to be put into effect during the coming year.

Over Two Millions for Aerial Mail Lines

Appropriation of $2,185,000 for purchase of aeroplane and maintenance of air-line service for the Post Office Department, which is an increase of $1,885,000 over the $300,000 originally estimated by the Department, is recommended in the Post Office appropriation bill reported to the House by Representative Moon, of Tennessee.

The bill carries recommendations for a total appropriation of $359,657,577. This is about $2,000,000 less than the appropriation for the present fiscal year, which was $361,477,577. The estimates of the Post Office Department for the next fiscal year amounted to $368,782,577.

There are a score of other important developments, each promising to require from a hundred to several thousand aeroplanes this year, such as the establishment of aviation sections in the police of the different cities. The fact that a single aerial policeman could have minimized the many losses of the Halifax fire, the recent Minnesota fire, and of numerous other such fires, floods, etc., as well as eliminating entirely the water pirates who prey on shipping wherever there is water commerce, will soon bring about legislation forcing each city to have an aviation section to its Police Department.

The Forestry Department, the Coast Guard, and other Government departments are also establishing aviation branches.

We know likewise of hundreds of sportsmen and others who are planning to purchase aeroplanes for use in the United States, Canada, South and Central America.

One of these plans to establish aerial passenger and express lines, headed by Captain Benjamin B. Lipsner, the energetic ex-superintendent of Aerial Mail Service, is announced elsewhere in this issue. Captain Lipsner and his public-spirited backers will use a number of large seaplanes and the manufacturing business from this one air line alone will, probably, be large enough to keep a factory going for several months.

Considering the above, which are only few of the high points of the prospects of the American aeronautic industry, we can truly state that the future is bright and that if the progressive manufacturers and leaders in the aeronautic movement join efforts by close co-operation, the aeronautic industry can be put on its feet and on a permanent self-supporting basis within the coming twelve months.

NEW YORK, CLEVELAND, CHICAGO AERO MAIL

THE first trip of the permanent Aerial Mail Line between New York-Cleveland-Chicago took place on December 18th.

The start was made soon after six o'clock from Belmont Park. Leon D. Smith piloted the first de Haviland Liberty plane which started just as day was dawning.

As AERIAL AGE goes to press Pilot Smith is on his way to Chicago.

Full account of the trip will be given next week.

Among the authorities present at the start were: Second assistant Postmaster-General Otto Praeger, from Washington; Postmaster Patten, of New York; L. T. Busler, chief of Maintenance and Equipment; J. Clark Edgerton, chief of Flying Operations; Alan R. Hawley, president of the Aero Club of America; Henry Woodhouse, Captain Robert A. Bartlett, and Steffanson, famous explorers, Charles Jerome Edwards, G. Douglas Wardrop, managing editor of AERIAL AGE; Ralph T. Hale, Norman H. White, Norman H. White, Jr., Evan J. David, business manager of FLYING; Leroy B. Gulotta, editor of AIR POWER; K. M. Turner, F. Gates Porter, M. Parker, the postmasters of Brooklyn and Belmont Park.

The progress made by aeronautics in the past three years has been enormous, and trans-Atlantic and trans-Pacific flights may be expected in the near future.

A few days ago an American aeroplane carried 50 passengers in a flight, and British, French, and Italian aeroplanes have carried up to 40 passengers in one flight. A dispatch from Italy reports that there is under construction an air liner which will carry 100 people for trans-Atlantic flights, and having beds and restaurant accommodations for the passengers.

Another aeroplane, carrying the famous British General Salmond, flew from Asia to Africa, a distance of close to 3,000 miles, and the Chilian aviator, Lieutenant Godoi, on December 11th, flew over the Andes, thereby completing the stupendous conquest of the mountains by aviators, who have now flown across practically every mountain range in the world, including the classic Great Atlas!

Verily this is the dawn of the Aerial Age, when those of us who have assisted the development of aeronautics for the past 15 years will see things happen such as we would never have dared to dream.

AERO CLUB OF AMERICA RENEWS EFFORTS TO GET PROPER AERIAL LAWS

THE creation of a substantial permanent committee to draft a series of laws covering national and international aerial navigation was authorized by the Board of Governors of the Aero Club of America.

This was done upon thé recommendation of the temporary committee of the Club, which reported to the Board of Governors today, urging prompt action.

This subject has been studied and followed by a committee of the Club, consisting of the Hon. Murray Hulbert, Director of the Port of New York; Alan R. Hawley; W. W. Miller; Rear Admiral Robert E. Peary; Rear Admiral Bradley A. Fiske; Henry A. Wise Wood; Henry Woodhouse; Alberto Santos-Dumont; John Hays Hammond, Jr.; W. W. Young; Colonel E. Lester Jones; Emerson McMillin; Charles Jerome Edwards; Augustus Post.

Members of this committee have followed every phase of development of aerial laws in Europe, and have had opportunity to study the effectiveness of the British Aerial Navigation Acts of 1911 and 1913, as well as the French, Italian and German aerial laws.

They have also studied the problems of national aerial navigation and have come to definite conclusions as to the necessity of having federal registration of aircraft, which they believe should be similar to the federal registration of ships.

The committee points out that all aerial navigation acts of European nations were intended to restrict the circulation and use of aircraft. They were essentially military measures, restructing aerial navigation to certain zones within nations.

What must be done now is to shape laws to govern international aerial navigation based on broad fundamental principles which will meet the conditions arising from the general use of large aircraft for the transportation of mail, express and passengers, as well as international air travel. It is pointed out that unless attention is given to this subject now, there is danger that half measures or restrictive laws may be adopted, and there is even danger of states adopting state registration laws, which would be absurd, since aircraft travel so fast that their employment for flying across the continent will soon be common. Therefore federal registration is recommended.

The Committee on Aerial Laws is to be appointed by Mr. Alan R. Hawley, the President of the Aero Club of America, within a few days.

CONGRESS INCENSED OVER DELAY IN TURNING MILITARY PLANES OVER TO AERIAL MAIL SERVICE

CONGRESS'S great interest in the aerial mail service was demonstrated on December 17—the fifteenth anniversary of the first flight—when the subject came up for discussion in the House of Representatives.

The remarkable record made by the Post Office in the past six months in running the Aerial Mail Service daily on schedule time, rain or shine, has created country wide demand for the extension of the service and the Post Office had arranged for this extension to take place immediately upon the signing of the armistice when the stopping of shipments of planes overseas would give the needed planes and motors for the mail service.

Under the provision made by Congress last year in the military appropriation bill the War Department is to turn over to the Post Office for the Aerial Mail Service planes and motors which cannot be used for military purposes. Acting under this act Secretary Baker, two weeks ago, ordered one hundred DeHavilands and twelve Handley-Pages turned over to the Post Office and some of these machines were to be used immediately for the extension of the Aerial Mail Service. But one delay followed another and, finally as the planes were not delivered by December 17, Congressman Moon, the chairman of the House Committee on Post Office and Post Roads, to get prompt action introduced a resolution ordering the War Department to deliver the planes and motors now, to save the large cost of storing them away.

Congressman Moon stated in Congress that the War Department had discretion as to turning over its aeroplanes to the Post Office. and that they had refused to let go of them. This statement aroused the wrath of several members, among them Representative Robbins, republican, of Pennsylvania, who said it was time Congress put a stop to allowing departments to run Congress.

"It seems to me that the Departments are ignoring the laws that Congress passes," said Mr. Robbins. "We sit here like a lot of dupes and supinely let these various departments run over us. It is time we asserted ourselves. We should make it mandatory upon the War Department to turn over these aeroplanes for this service instead of appropriating over $2,000,000 for the Postmaster General to buy aeroplanes that are already available and of no use to the War Department. The war is over now, and unless these machines are used for carrying the mails they will rust out and disintegrate."

The same view of the situation was taken by Representative Sumners, democrat, of Texas. He insisted that it was time to use "horse sense" and that it was ridiculous to buy more aeroplanes and let those now available in the War Department be put to useless employment.

"If the Secretary of War will not turn these machines over," said Mr. Sumners, "he should be compelled to do so. We ought to stop spending money uselessly.

Resolution to Force Delivery

Representative Madden defended the proposal to have the Post Office Department buy aeroplanes that the transcontinental mail service may be established promptly. He did not oppose the amendment offered by Mr. Moon, however, to have the army aeroplanes turned over to the Post Office Department, but insisted that the department should have them by whatever means it was necessary to employ to get them.

After the point of order against the Moon amendment had been sustained by the chair it was offered in an amended form by Representative Garrett, democrat, of Tennessee, and provided as follows:—

> That the Secretary of War is hereby directed to deliver immediately to the Postmaster General 100 de Haviland fours, 100 Handley-Page planes, 10 Glenn Martin day bombers, all planes completely assembled, with spare parts. Also 100 Liberty motors, with spare parts, 50 Hispano-Suiza 300-horsepower motors and 25 Hispano-Suiza 150-horse power motors. The same is to be out of any equipment that the War Department has on hand or under construction, the War Department to be credited with the equipment turned over.

The Garrett amendment cut the appropriation from $2,185,000 to $500,000 and provided that none of this sum is to be used for purchase of new machines, but merely for maintenance and operation. It is expected that this amendment finally will be agreed to when the bill comes up for final action. The discussion to-day was in committee of the whole and must be approved later when the bill is finally voted on.

CAPTAIN LIPSNER PLANS EXTENSIVE AERIAL TRANSPORTATION LINES

THE energetic Capt. Benjamin B. Lipsner, who recently resigned as superintendent of the aerial mail service, announced on December 17 that a syndicate had been formed to back him in establishing an aerial passenger and express service. The enterprise will have a capital of $1,000,000.

He also declared that unless some one should do so before him he will make the first trans-atlantic flight June 15, following the route taken by the steamship George Washington, which carried President Wilson to France. A seagoing plane to make the flight, he continued, now is in course of construction and it will be built so it will be able to fly, rain or shine. As to the service in this country he added:

(*Continued on page 761*)

THE NEWS OF THE WEEK

600 Naval Airmen Return

Norfolk, Va.—More than 600 officers and men of the naval aviation forces who have been serving overseas arrived at the Hampton Roads naval base December 15 on the transport Susquehanna, which was sixteen days crossing the storm-swept Atlantic. In spite of rain and mist, the men were welcomed by a big crowd.

Among the arrivals was Franklin K. Lane, Jr., son of the Secretary of the Interior, who was greeted by his father, mother and sister.

Major Hitchcock Among Those Honorably Discharged

Major Thomas Hitchcock, sportsman and polo player, has been honorably discharged from the air service at his own request. He is now in Aiken, S. C., with his family.

His son, Thomas Hitchcock, Jr., of the Lafayette Escadrille, who became an ace before being shot down, is with his father, recovering from his wounds.

The Navy Fliers

In his annual report Secretary of the Navy Josephus Daniels pays high tribute to the Aviation Branch of the Navy. The expansion of Naval Aviation, it is stated, has been of gratifying proportion and effectiveness. Statistics show the total enlisted and commissioned personnel on July 1st, 1918, numbered approximately 30,000. Of this number, 823 were trained naval aviators. There were 2,052 student officers, 400 ground officers, 7,300 trained mechanics, and 5,400 mechanics in training.

Declaring that Naval Aircraft had been a big factor in the war, Secretary Daniels in his report declares that plans are being made for its permanency and development. The Secretary paid tribute to the Ordnance Bureau of the Davis Nonrecoil Aircraft Gun, which is declared to be "A Great Milestone in Aircraft Armament."

Airships Can Cruise Now for 4,000 Miles

London.—For the immediate future, according to further extracts from the reports just completed by the Civil Aerial Transport Committee of the Air Board, the commercial airshap offers a great advantage over the aeroplane, particularly concerning passengers where comfort and ease of navigation and a high ratio of disposable litt are vital considerations.

Airships now exist, the report says, with a range of more than 4,000 miles, and they can travel at a speed of seventy-eight miles an hour. By running their engines slower a maximum range of 8,000 miles can be obtained.

On first speed, Cape Town, South Africa, is today aerially only a little more than three days from Southampton, while this ship could fly across the Atlantic and return without stopping.

The committee points out that the future airship will soon develop a speed of 100 miles an hour, that it will be fitted with ample saloons, staterooms, with an elevator to a roof garden, and will be able to remain in the air for over a week.

Limits Stunts in Aeros

Because many aviators in this country had taken to acrobatics since the armistice was signed, resulting in an increased accident list, the War Department recently ordered there should be no fancy flying lower than 1,500 feet. The acrobatics, it was stated, had been performed largely in connection with celebrations near cities, towns and buildings. Strict discipline will be enforced against any violating the new order.

New Insignia for Instructors

Washington.—Army aviation instructors have been authorized by the War Department to wear on the left arm a sleeve decoration consisting of gilt wings the same size as those in the insignia on the collar decoration.

This award, it was announced, "is made in appreciation of the services of the several hundred fine fliers who have been kept at home for use on the flying fields of this country in turning out the quota of pilots asked for by the Allies.'

Aviators Can Talk 25 Miles by Radio Phones

Camp Meade.—Aviators can now talk twenty-five miles through the air to radio telephone men on the ground.

Announcement of the rapid improvement of the wireless telephone, which permits such use of the radio outfit, has been made by signal corps officials here.

"Even in the worst of weather we have no difficulty in talking six miles over the wireless telephone," said private William Kunst, one of the wireless experts at the camp. "In clear weather, when atmospheric conditions are excellent, we can talk twenty-five miles over the phones," he declared.

Flies Over Highest Andes

Buenos Ayres.—Lieut. Dagoberto Godoy of the Chilean army crossed the Andes Mountains at their highest point in a Bristol aeroplane, donated by the British Government. The aviator left Santiago, Chile, and crossed the Tupungato range at an altitude of 19,700 feet, landing at Mendoza, Argentina.

Lieut. Godoy is the first Chilean and the second man recorded as crossing the Andes by aeroplane. The first flight across the mountains was made last April by Lieut. Cendelaria of the Argentine army, who crossed at an altitude of nearly 11,000 feet.

Fly from Egypt to India to Confer About Air Route

London.—Major Gen. Salmond, commanding the Royal Air Forces in the Middle East, accompanied by Captain Ross Smith, has arrived at Karachi, on the Baluchistan border, and is in conference with the Government of India regarding the establishment of an aerial service to India.

These aviators have just completed a flight from Cairo to Karachi, 2,548 miles, in thirty-six hours actual flying time. Their route was by way of Damascus, Bagdad, Bushire, Bandar Abbas, Sarbaz and Karachi.

The machine used for the purpose had previously been flown from England to Egypt and took active part in final operations against the Turks in Palestine.

General Salmond will continue his journey by air to Delhi.

British Arranging Tours by Air Routes

London.—The first aerial commercial service in Great Britain is already in the last stages of development, with the initial route connecting London and Harrogate and the speed to be 120 miles an hour.

Holt Thomas, managing director of the British Aircraft Manufacturing Company, said:

"It will be a summer service at first, and we will use the single engined war aeroplanes, with comfortable covered cabins holding four passengers. We are also opening air routes all over the world in conjunction with local companies. In France we will operate in connection with a French company, and already arrangements for such a service are practically completed in Norway, Denmark, Italy, India and Africa. Later we will extend the service to Japan, China and the West Indies."

Arrangements already have been made by the British Air Service to keep Paris in close touch with London during the peace conference. Any important data required at the conference will be forwarded from London to Paris by aeroplanes.

Promotions and Commissions

Washington.—The decision made by Secretary of War Baker, withholding all recommended promotions and commissions in the Reserve Corps and United States Army, has excited very unfavorable comment. It would seem that all recommendations for promotions and commissions that were on file in the War Department as a result of hard labor and faithful work should be acted upon favorably, and the desired honor granted to all recommended if filed with the adjutant general prior to the date of the armistice. Not since the war started has there been such bitter disappointment expressed on any subject of like nature as on this matter. As many of the prospective recipients of the advanced honors are about to be disconnected with the service—the cost to the government would be but a mere trifle and in many cases the promotion and discharge would be simultaneous—or could be made so.

The famous veteran aviator Carl Batts, who was the first to loop 136 times consecutively, his father, John T. Batts and brother Lieut. W. H. Batts

Report of Trans-Continental Map-Making Tour

In a wire report dated Tucson, Arizona, December 6th, to the Division of Military Aeronautics, Major Albert D. Smith, commanding the squadron of five planes on the way East from Rockwell Field, San Diego, California, said that the work of map-making and location of landing fields for the Southern trans-continental air route was proceeding satisfactorily. One plane was lost in a fog over the Arizona desert on the first day out, and in the forced landing that resulted this plane suffered such damages that it had to put back to Rockwell Field. Part of Major Smiths report follows:

"In compliance with instructions, five Curtiss JN. 4-H planes departed from North Island at 2:30 P. M. on December 4th. One plane became separated from the squadron on account of a heavy desert fog lying low along the east side of the mountain range. This plane was forced to land at Ellentro, damages resulting, and the following morning it returned to San Diego. The four other planes landed at Calexico, Camp Beacon. This field is considered too small for practical uses, but the Calexico Chamber of Commerce will gladly enlarge the field if requested. The four planes proceeded on their way, starting from Calexico at 12:00 noon December 5th. Navigated by compass, the squadron crossed the desert. No possible landing fields were seen on this course.

"The squadron picked up the Southern Pacific railroad tracks at Yuma. No landing field is available at this place at the present time, although one can be arranged. Following the Southern Pacific to Gilabend, few available landing fields were noted on this course. At Gilabend the squadron left the route of the Southern Pacific and took a Northeastern course by compass direct to Phœnix. Landing fields are available along the Gila River for nearly the entire distance between Gilabend and Phœnix. All the planes landed at Phœnix safely on the fair grounds, which was small even for a squadron of this size. However, at my request the field on the ground was enlarged to proper size. The city of Phœnix is very anxious to assist in every possible way, even to the extent of erecting a hangar, if needed. The city of Phœnix has asked that the landing field here be named 'Luke Field.'

"Upon examining planes here it was found necessary to change one propeller, which we were able to do, having carried two extras along with us. Minor adjustments were also made on other planes.

"On the sixth the weather was cloudy the entire day, with light showers.

"Leaving at 2:45 P. M. December 7th, the squadron, resuming its flight towards El Paso, took a southeastern course by compass, locating suitable landing fields under us for practically the entire distance to the Southern Pacific railroad tracks at Casasgrand. From this point the squadron followed the Southern Pacific tracks to Tucson, locating landing fields in the valley adjacent to the railroad for the entire distance.

"Tucson has a perfect landing field available. Two hundred acres are leveled and rolled for our use and the city is willing to erect a hangar. This field is 2½ miles from the city.

"We will probably land at Deming, New Mexico, for supplies, having encountered a twenty-five mile wind from the east since leaving Calexico."

The Wireless Telephone

The development of voice control of aeroplanes in flight recently demonstrated publicly for the first time by Colonel C. C. Culver before President Wilson and others provides an interesting story. The idea of giving command by voice to a fleet in the air was first conceived by Colonel Rees and Colonel Culver in October, 1910, while on duty at the International Aviation Tournament at Belmont Park. In August of the same year Colonel Culver and H. M. Horton, (now Captain in the Air Service) established communication by radio telegraph from an aeroplane in flight to the ground at an aeronautical meet at Sheepshead Bay, New York. Captain Horton built the transmitting set and Colonel Culver the receiving set.

Five years later Colonel Culver was sent to the Aviation School, San Diego, California, for the purpose of studying the practicability, and for the purpose of working on the general program, of radio for aeroplanes. For more than a year he worked on various devices. Telegraph apparatus was designed and built which enabled the establishment of communication from aeroplane to ground, from distances up to 140 miles. On September 2, 1916, a message was transmitted from one aeroplane to another in flight for the first time. It was about this time that the development of radio telegraph set for aeroplanes was undertaken.

Colonel Culver continued his experimenting and in February, 1917, a trial of the radio telephone set resulted in the transmission of the human voice from aeroplane to ground. On May 22nd of the same year General George O. Squier, Chief Signal Officer, called into conference Colonel Reese of the Flying Corps, Dr. F. B. Jewett of the Western Electric Company and Colonel C. C. Culver, U. S. A., for the purpose of discussing Air Radio Telephone Communication. In order to bring the problems in connection with the development of voice control in concrete form to the attention of the radio telephone engineers in the country, a memorandum was given to Dr. Jewett covering the general requirements of an air Radio Telephone Set. General Squier then organized a Radio Development Section of the Signal Corps, in charge of Lieut.-Colonel Slaughter. A private exhibition of the demonstration of telephonic communication from an aeroplane in flight was given on August 22nd, before Secretary of War Baker and Chief of Staff General Hugh L. Scott at Langley Field, Va. In the Fall of the same year Colonel Culver was sent abroad, taking with him sets of various types of apparatus, in order to demonstrate to the officers of the United States and Allied forces the practicability of the idea. On the return of Colonel Culver to the United States in the present year, under the immediate supervision and with the whole-hearted support of Major-General Wm. L. Kenly, Director of Military Aeronautics, there has been continuous progress made in the working out of tactical problems through the use of the wireless telephone and the development of its application to various air service activities.

The A B C of Aviation

The A B C of Aviation, compiled by Captain Victor W. Page of the Signal Reserve Corps, A S., is a most complete and practical treatise outlining clearly the elements of Aeronautical Engineering with special reference to simplified explanations of the theory of flight, aerodynamics, and basic principles underlying the action of balloons and aeroplanes of all types.

A non-technical manual for all students of aircraft, including instructions for lining up and inspecting typical aeroplanes before flight and also gives easily understood rules for flying.

This sells at $2.70 postpaid, and is obtainable at The Aeronautic Library, Inc., at 299 Madison Avenue, New York City.

Aeroplane Characteristics

Aeroplane Characteristics, compiled by Frederick Bedell, is a systematic introduction for flyer and student and for all interested in aviation. It explains in a most comprehensive manner the principles of aeroplane sustentation and stability, the characteristics of an aeroplane in flight, air resistance and power characteristics. There are several diagrams included in this volume. This book sells at $1.75 postpaid, and is obtainable at The Aeronautic Library, Inc., 299 Madison Avenue, New York City.

Aeroplane Construction and Assembly

Aeroplane Construction and Assembly, compiled by J. T. King & N. W. Leslie, is a most instructive manual on aeroplane construction and rigging.

It gives the mechanic a practical understanding of the work he will be expected to carry out.

It is an elementary and comprehensive volume for the beginner, taking in flying, materials used, structural features, assembling and alignment of same.

It also contains a very valuable nomenclature of aeronautical terms, and a line drawing of an aeroplane descriptive of all its parts and how to locate them easily.

This book sells at $1.65 postpaid, and is obtainable at The Aeronautic Library, Inc., 299 Madison Avenue, New York City.

Third of the People Will Travel in Air in Ten Years

"Dirigibles for scouting and observation," answered Leo Stevens, foremost of balloonists, chief instructor and expert now at Fort Omaha, when asked what next would develop in army ballooning. "Dirigibles will make 100 miles an hour and aeroplanes travel 250 miles an hour in two years," Mr. Stevens continued. "I predicted in 1906 that dirigibles would cross the Atlantic in a few years and they will."

"You don't care where your free balloon drifts?" he was asked, relating to his trip this week to Topeka.

"Oh, yes, I do care," he spoke up quickly. "I'm one of the few men who thinks he can go about where he pleases if he finds the air current he is in or a current above or below is going in his direction. There are as many air currents as there are points of the compass; some do not have a drive behind them."

Since he raced with Santos Dumont, Stevens has been a "hopeless enthusiast" in ballooning. He prefers its "smooth motion" to that of the aeroplane. "You cannot observe much from the plane," he says. "It is like some one throwing gold out all the way. I can see more from an aeroplane with my naked eye than with the glasses. But the aeroplane is the defender of the kite balloon and they work together."

It was nine years ago that Mr. Stevens did his first work for the Government through his offer to General Allen. The army had no balloons; he happened to have ten of different sizes, two of them dirigibles.

Mr. Stevens praises the business men who got into ballooning. The first twenty of these, who went into the army, including Captain C. J. Glidden, he taught.

"Within ten years many wealthy people," forecasts Mr. Stevens, "will be living in the air part of the time and owning balloons, power balloons and aeroplanes and taking 1,000 and 1,500-mile trips with no trouble at all. Thirty per cent of the people will travel through the air ten years from now," and Mr. Stevens digressed to tell how beautiful it is never higher than four miles up with the sunshine there all the time.

"The sausage balloon or kite balloon has played a most important part in the past war," Mr. Stevens declares, "directing the firing of the cannon. The pilot balloonists made at Omaha were the only ones ready to get into the war."

Some of them were 40 to 60 years old; one might think past the age of adventure and getting the idea of ballooning. But they did it.

"What shall I do next? I don't know what the Government wants of me. Chances are I shall go back to private life. I have taught personally 600 men as much as I know; there are 6,500 trained men in the ground aviation work of the balloon corps."

The Glenn L. Martin twin Liberty engined bomber that flew from Pittsburgh to Washington, a distance of 175 miles in one hour and fifteen minutes

The AIRCRAFT TRADE REVIEW

New Standard Aircraft Club Opened

On Monday, December 9th, the new clubhouse of the Standard Aircraft Club was formally opened with a dinner, followed by a dance.

The club is a reconstruction of the big hangar that was built to house the Langley, the first Handley Page machine to be built by the Standard Aircraft Corporation.

In it are bowling alleys, swimming pool, billiard rooms, writing rooms and all the conveniences of a real club.

Change of Dates of Automotive Engineers Annual Meeting

The time of the Winter Meeting of the Society of Automotive Engineers, which was to be held January 12-14, has been changed to February 4-6. These latter dates have been set as a matter of convenience to the S. A. E. members who desire to attend also the New York Automobile Show to be held during the first two weeks of February at Madison Square Garden. The S. A. E. members are engaged in automotive engineering at all the automobile, truck, tractor, aeroplane, and motorboat points in this country, as well as many such manufacturing centers abroad.

This Carry Through Meeting of the S. A. E. to be held in February will be the occasion of illuminating technical sessions on the different automotives, and on fuel for internal-combustion engines. A whole half-day session will be devoted to consideration of gasoline, kerosene, benzol and other fuels. Representatives of the Government will present their latest data as to supplies and the results of recent intensive research of a startling nature. Men of acknowledged authority will discuss this matter from the standpoint of engine design. Many other timely subjects will be discussed. Members returned from the front will relate their experiences, and particulars never before made public concerning war automotive apparatus will be given in papers by members and others in Government service.

The S. A. E. Victory Dinner will be held on February 6 at the Hotel Astor. It is expected that in attendance and interest this will break all records of the Society.

New Balloon Gas for Army and Navy

Washington—Discovery of an inert, non-inflammable gas for balloons, dirigibles and other lighter-than-air craft was revealed by the Navy Department December 9 in a statement explaining expenditures for its production now being made jointly with the army.

The department said the use of this new element, officially termed "argon," will eliminate the hazard of fire and explosion that always has accompanied balloon operations where hydrogen has been used to inflate the gas bags.

The gas from which "argon" is obtained comes from the wells at Petrolia, Tex., owned by the Lone Star Gas Company, the statement said, and a ten-inch pipe line to cost $1,050,000 is being laid for a distance of ninety-four miles from the wells to a plant at North Fort Worth, where the gas will be compressed into cylinders for shipment to the balloon fields.

High-proof gasoline is obtained in a ratio of about five gallons per 1,000 cubic feet of gas, it was said, and after the 1 per cent. of "argon" is removed by agreement with the Lone Star Company, the remainder of the gas is turned into the city mains of Fort Worth and Dallas.

The department estimates that the plant at North Fort Worth, designed by the Navy Bureau of Yards and Docks, and which will cost $900,000, will be completed by next April 1.

War Risk Insurance Information

A compensation application blank for a person disabled in the service (Form 526, Treasury Dept., BWRI) should be furnished to every disabled officer and enlisted man and every officer and enlisted man claiming disability at the time of his separation from the service. Assistance should be rendered in filling out the application, and complete information as to the proof required in support of his claim should be supplied to the claimant. Care should be taken in answering Question 5 on page 2 of application blank that a statement is made as to whether the claimant was accepted for general military service or for special or limited service only. [See also last sentence of Par. 9, Cir. No. 73, W.D., 1918.]

The compensation application blank, when properly filled out and executed by the officer or enlisted man, will be forwarded immediately by the camp personnel adjutant to the Compensation Section of the Bureau of War Risk Insurance with the copy of the report of the physical examination of the officer (Form No. 395-1, A.G.O.) or of the enlisted man (Form No. 135-3, A.G.O.) attached thereto. If the officer or enlisted man does not desire to execute an application for compensation the notation "Officer (soldier) did not desire to execute Form 526, BWRI," will be written or stamped on the copy of Form No. 395-1, A.G.O., or Form 135-3, A.G.O., as the case may be. The copy of the report of the physical examination of the officer or enlisted man will then be forwarded by the personnel adjutant without letter of transmittal directly to the Compensation Section of the Bureau of War Risk Insurance. (See last sentence of Par. 2, Cir. No. 23, W.D., 1918.)

The proof called for in paragraphs 3, 6, and 7 of the instructions on page 1 of the application blank should be incorporated in the blank affidavit on the last page of the application blank whenever possible. If the affidavits of two persons to the required facts cannot be secured when the application is executed by the officer or enlisted man, he should be advised that they must be obtained on his return home and forwarded to the Compensation Section of the Bureau of War Risk Insurance, with a statement giving his full name, Army serial number, if an enlisted man, grade and organization in the service and date of discharge or separation therefrom.

The claimant should be advised that so much of the proof called for in paragraphs 3, 4, 5, 6, and 7 of the instructions on page 1 of the application blank as is not incorporated in affidavits on the last page of the application at the time the application is executed, must be secured by him on his return home and forwarded immediately to the Compensation Section of the Bureau of War Risk Insurance in support of his claim.

The advice and assistance of the camp war risk judge advocate should be fully utilized in the preparation of applications for compensation.

By order of the Secretary of War:

PEYTON C. MARCH,
General, Chief of Staff.

WATERPROOF WATCH

THE war has been instrumental in bringing about the creation of an absolutely "water and dust proof watch."

The many hundreds and thousands of wrist watches which went "bad" while in use by the men of the Overseas Forces caused an investigation to determine the reason for the short life of the wrist watch.

After countless movements had been examined and tested, Mr. Depollier's men reported that in the majority of instances the watches had become useless because of the inadequate protection afforded by the watch casing. Water, dust and poison gas had all percolated into the interior of the watch, rendering the delicate works useless and generally a total loss. Movements themselves, when manufactured by a reputable maker, appeared to be without fault and therefore the designing and creating of a casing "which could not fail,' even under the stress of such strenuous service as it would be put through by the Overseas Forces, was finally undertaken by Mr. Depollier.

The patent records of Europe and the United States show that for over fifty years many attempts have been made to produce a waterproof watch, watches which all ended in being merely moisturepoof, and at that, resulting in failure, for the water and moisture inevitably percolated through the case by capillary attraction.

Mr. Depollier states that it took him more than twelve months to discover the reasons why previous makers had not produced a real waterproof watch which would stand the wear and tear of practical and constant usage.

While many attempts had been made to produce such a casing, none was able to withstand varying climatic conditions, and neither did the complicated design of the case permit easy access to the regulator or the watch hands. It seemed to be the limit of the manufacturers' ability to produce watches only temporary moisturepoof for exhibition purposes.

Constant demands from Aviators, Marines, the Army and Navy, and men engaged in out-of-doors pursuits necessitated the creation of this new water and dustproof watch. Mr. Depollier immediately recognized this necessity and was sufficiently encouraged to experiment toward the production of such a watch-case, a case without wearing parts, with no rubber, cement, paraffine or other waterproofing material which would dry, crumble or devitalize with time. Obviously such a case must also be so designed as to be "foolproof" as well as water and dustproof, for the watch would have to be wound once every twenty-four hours and yet prove impervious to water, dust, alkaline, gas or other injurious foreign substances.

In the booklet describing the Depollier water and dustproof watch the construction is described as follows:

"The Depollier Field and Marine Watch has, as a packing for the back and bezel, a washer which is soaked with a water-repelling saturant, and the back and bezel are screwed down. Portions of the back and bezel press against the washer and squeeze the saturant out into a reservoir, which receives the overflow, keeps the washer saturated, and prevents it from getting dry, or becoming devitalized, or glazed. In other words, the washer is like a lamp wick. It has a reservoir to draw the saturant from, thus permitting the washer to retain its resilience. This produces a watch case which will retain its waterproof quality indefinitely.

"The adoption of an unbreakable, non-inflammable glass necessitated in itself a separate invention, the 'double-clinched bezel,' for it had been found that sudden climatic changes from a warm room to the freezing air of the winter months contracted the cellulose material used as a glass to such an extent that it became loose and more frequently came entirely out of the bezel of ordinary design, leaving the watch-dial unprotected.

The double-clinched bezel overcame this harmful effect, and while it not only grips the glass above and below around the entire circumference, it renders the contact between glass and bezel the only practical water and dustproof bezel.

The effect of these remarkable improvements in the designing of a watch case has had a marked tendency to disprove the unconsciously adopted feeling that "all the qualities of a good watch are in the movement." The War proved that regardless of the high type of movement, it must be adequately protected by its casing.

The Depollier waterproof watch, known as the Depollier "Field and Marine" Watch, is subjected to rigid tests before the movements are fitted, and again after this operation they are given a further individual pressure test under water before leaving the inspectors.

To the out-of-doors active man, sportsman, traveler, seafaring man, or man engaged in a pursuit where he is in an atmosphere of dust or grit or dampness, the Depollier water and dustproof watch is the only watch qualified to withstand exposure to such conditions. It protects the movement from the salt air, ice, dampness, alkaline dust and heavy winds carrying always minute particles of dirt and dust.

New York-Chicago Aero Mail

Postmaster General Burleson has issued an official order directing the inauguration of the aero mail service between New York, Cleveland and Chicago on Wednesday, December 18. The planes to fly the route will be distributed to the various stations the end of this week and trial trips will be made over the entire route to acquaint the aviators with the landmarks of their new territory. The plane will leave the landing field at Elizabeth, N. J., at 6 o'clock in the morning, the mail being dispatched from New York City Post Office at 4 o'clock. The start from Chicago will also be made at 6 o'clock in the morning.

On a 10-hour schedule the mail should arrive at New York at 4 p. m. and on a 9-hour schedule at 3 p. m. It should arrive at Chicago at 3 p. m. on a 10-hour schedule, and at 2 p. m. on a 9-hour schedule. In order to maintain a 10-hour schedule the actual flying time must be at the rate of 75 miles an hour. With the actual flying time of the planes at the rate of 80 miles an hour a schedule of 9 hours can be maintained. With the 135 miles per hour DeHaviland and 135 miles per hour Curtis R-4 machines it is expected to be able to maintain a 9-hour schedule except in days of severe head winds.

Arrangements have been made to dispatch mail on train 140 leaving Washington at 9.25 p. m., which will include dispatches from Washington, D. C., Baltimore, Md., Philadelphia, Pa., Wilmington, Del., and Trenton, N. J., due at Elizabeth at 5.40 a. m., which, together with mail from the Elizabeth, N. J., Post Office, will be taken to the field for dispatch by aeroplane schedule at 6 a. m.

Mail from Newark, Jersey City, Brooklyn and New York City will arrive at the aviation field at Elizabeth by 5 o'clock in the morning.

Mail from St. Paul, Minneapolis, Milwaukee and points nearby Chicago should be dispatched so as to reach Chicago about 2 a. m. for eastern air mail dispatch at 6 a. m.

Letters by aeroplane may be registered. The rate of postage is 6 cents an ounce, with either the distinctive aeroplane stamp or an ordinary 6-cent stamp marked "By Aeroplane." Persons desiring their letters to be given special delivery service instead of regular carrier service after the arrival of the aeroplane may add to the aeroplane postage 10 cents for special delivery.

Over Two Millions for Aero Mail Lines

Appropriation of $2,185,000 for purchase of aeroplane and maintenance of air-line service for the Post Office Department which is an increase of $1,885,000 over the $300,000 originally estimated by the department, is recommended in the Post Office appropriation bill reported to the House by Representative Moon of Tennessee.

The bill carries recommendations for a total appropriation of $359,657,577. This is about $2,000,000 less than the appropriation for the present fiscal year, which was $361,477,577. The estimates of the Post Office Department for the next fiscal year amounted to $368,782,577.

Xmas Cards By Aero Mail

Christmas cards may be mailed by aeroplane service for 6 cents on or after December 15th. This is the first Christmas that it will be possible to send Christmas messages in this way.

Note: Number of hours of dead flying for the month, 10 hrs. 41 min.

Explanation of Tabulation:

1. *Miles flown:*

Leg from Washington to Philadelphia ..... 128 Miles
Leg from Philadelphia to New York ..... 90 Miles

Miles flown for the day, whether one, two, three or four legs of the trip have been made. The aim is to get exactly the number of miles flown in connection with the mail service each day. Therefore, mileage of partial trips should be indicated.

2. *Hours of flying:*

To include the actual hours and minutes the machine is in the air with mail.

3. *Mail carried:*

In this column, under A., give pound of aeroplane mail; and under O., give pounds of ordinary mail.

4. *Percent of performance:*

Round trip Washington-New York consist of four legs, each leg valued at 25% if completed by aeroplane and not by train before close of day.

Otto Praeger, Second Assistant Postmaster General.

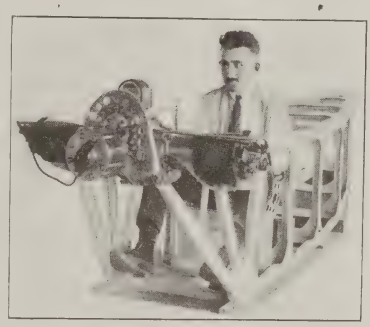
THE MARTIN K-III SINGLE SEATER

SOME of the distinctive features of the Martin K-III, 45 h.p., single-seater, are retractable landing chassis, the K-bar cellule truss, wing end ailerons, and shock-absorbing rudder, which have been patented by Captain James V. Martin, the veteran aeronautic engineer. These features are interesting solutions of difficult aerodynamical and constructional problems and show the tendency of modern design toward the attainment of efficiency with low power rather than the employment of great power to overcome the disadvantage of uncertain design.

The K-III was designed as an altitude fighter, and is equipped with oxygen tanks behind the pilot's seat and provision for electrically heating the pilot's clothing. The seat is so located that excellent vision is obtained; vision vertical circle from dip of 5° dead ahead through an arc of 180°; horizontal circle 360°, transverse circle from dip of 27½° through an arc of 235°.

Captain Martin is opening offices at 299 Madison Avenue, New York City, where plans are already under way for building the K-III to sell for $2,000. The machine can light upon and start from a country road and can travel 22 miles on one gallon of gasoline, making it an economical means of carrying mail and light express in rural free delivery; for carrying newspapers, passengers, etc. In fact the cost of operation and maintenance is not much greater than for a Ford automobile, but the work is done ten times faster.

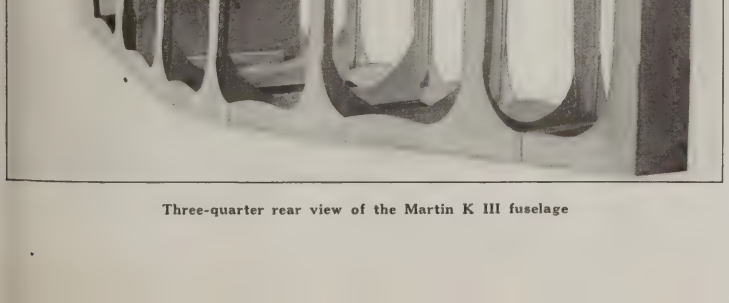
Dimensions



Span, upper plane (without ailerons)	15′ 0″
Span, lower plane	17′ 11¼″
Chord, both planes	3′ 6″
Gap between planes	4′ 6″
Length overall	13′ 3½″
Height overall	7′ 4¼″

Areas (Sq. Ft.)

Upper plane (without ailerons)	52.50
Lower plane	47.80
Ailerons	5.00
Stabilizer	9.50
Elevators	6.66
Rudder	4.88



Weights (Lbs.)

Engine	85.50
Wings	60.75
Ailerons and supports	9.50
Chassis and retracting mechanism	16.38
Wheels	17.50

Engine mounting, Martin K III Scout

Struts, wires and K bars	8.25
Oil and gasoline tanks	9.75
Rudder and tail skid	7.75
Damper and elevator	14.50
Fuselage, complete	106.50
Propeller and hub	13.62
Total weight	350.00

Three-quarter rear view of the Martin K III fuselage

Performance (Estimated)

Altitude (Ft.)	Time (Min.)	Speed (M.P.H.)
0	0	135
5,000	3	113
10,000	6	112
15,000	11	111
20,000	18	108
25,000	28	97

(With 60 h.p., 100-lb. engine—speed 145 m.p.h. at 10,000 feet.)

Endurance at 10,000 feet:

At full power	222 miles
At minimum power	216 miles

Main Planes

The planes have neither stagger nor dihedral.

The aerofoil of main planes is known as the "Ofenstein 1." At 40 m.p.h. the Ofenstein wing section has a lift-drift ratio of 22 to 1.

Upper plane is in a single continuous span. Wing ends are at right angles to the leading edge, and are finished off with a semi-circular termination which varies in radius as the wing varies in thickness. The half-round wing ends are characteristic of all the aerofoils of the Martin K-III.

Principal wing spars for main planes are centered 14½″ back of leading edge, where the trusses carrying the lift are direct instead of bridged between the ribs.

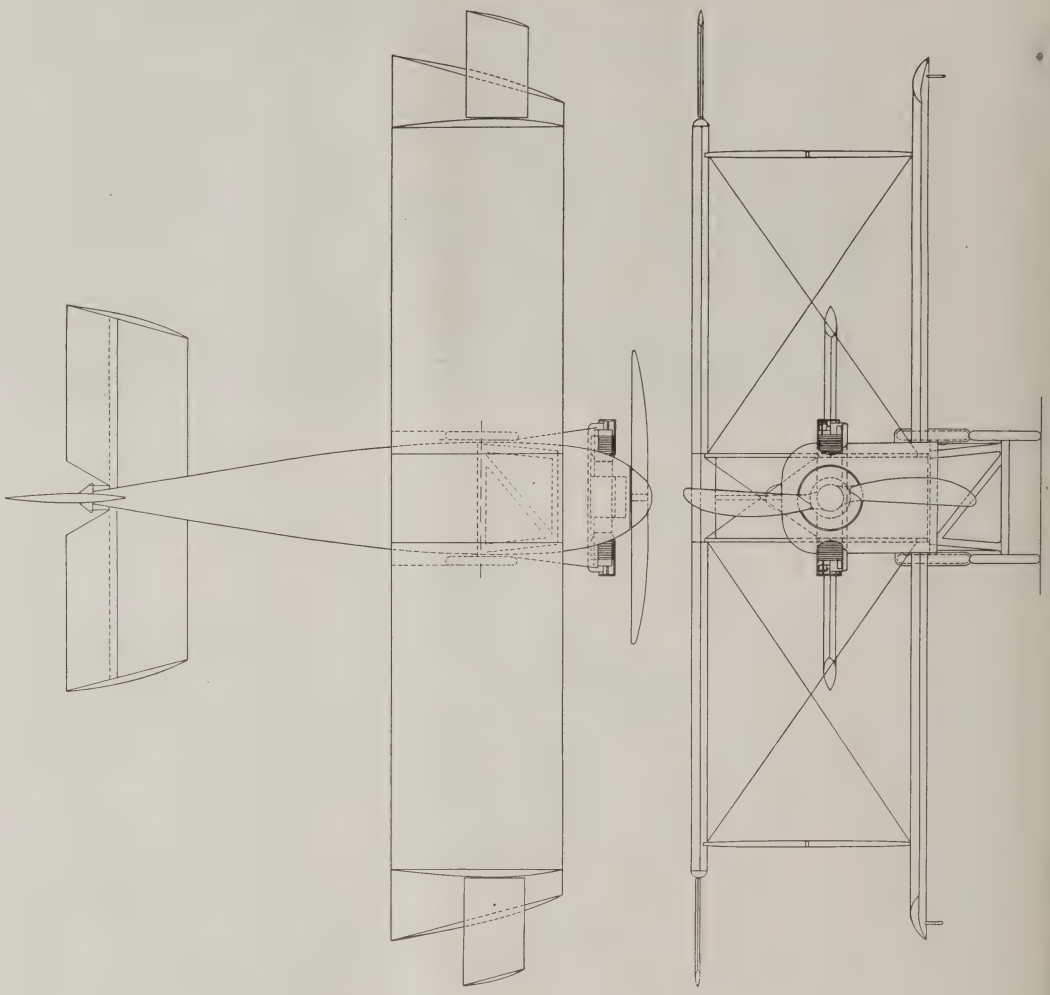
The front of main wing beam is coincident with the most forward travel of the center of pressure.

The lower plane is in two sections, and attachment made to the fuselage. Wing ends are raked at an angle of 15 degrees.

Interplane bracing is of the "K-bar" cellule truss type. The head-resistance is reduced 4 per cent through the elimination of struts and wires.

The percentage of inter-cellule interference with the K-bar truss is 15% as compared with 25% in the standard truss; a total reduction of 40%. Of this reduction, 16% is due to the elimination of struts and wires while 24% is due to the increased gap obtained without subsequent weakening of truss or increase of structural resistance.

K-struts centered 14′ from one another. The vertical member is 4′ 3½″ long; greatest section, 1¼″ by 4½″. The angular members of K-struts are attached to rear wing beams located 18″ back of main beams. These members are of steel tube faired with sheet aerometal.



The vertical member of the strut is not subject to any bending moment at the juncture of the inclined members, for the upper member is in tension and the lower in compression, thereby neutralizing the forces at that point. The mid-strut fitting is designed with a view to equalizing the moments and relieving the vertical member of all except the usual direct compression.

Flying and landing wires are 3/16″ diameter. Center section cross-bracing is with ⅛″ diameter wire.

The wing-end ailerons are an unusual departure from customary aileron disposition. They have a righting influence per square foot of area of 4 to 1 with the added advantage that they do not impair the efficiency of the aerofoil to which they are attached.

The ailerons have a symmetrical double convex surface and are so balanced that their operation requires very little effort.

Ailerons are operated by means of a sliding rod running through the upper plane. Two cables running up the center panel struts cause the rod to slide from side to side. At the wing ends, the bar fits into a tubular collar attached to the ailerons. The collar is provided with a spiral slot or keyway through which a pin from the rod projects. The sliding movement of the rod causes a rotary movement of the aileron collar. This method does away with all exposed actuating members.

THE MARTIN
45 HP ABC ENGINE
K III SCOUT

Scale of Feet

McLaughlin

THE MARTIN K III SCOUT

(*Continued from page 759*)

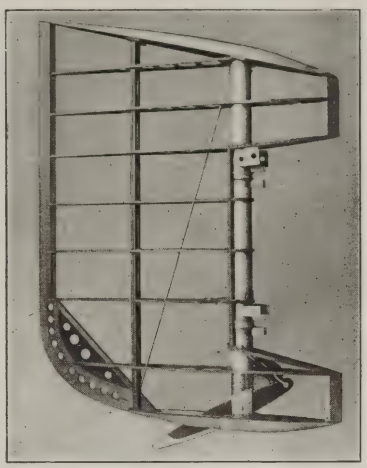
Fuselage

Overall length of fuselage from engine plate to rear termination, 10′ 10 7/16″. Maximum depth, 3′ 0¼″ (not including streamline head rest); maximum width, 2′ 2⅛″.

The center of gravity is located 2′ 7½″ back of the engine plate.

Veneer of ply-wood is used for the internal construction of the fuselage.

In flying position, the top of the rounded turtle deck is practically horizontal. The upper longerons as well as the lower have an upward sweep towards the rear. The fuselage terminates in a vertical knife edge 18″ high.



Internal bracing of the fuselage is with solid wires looped over clips at the ends of cross-bracing members. Wires are run in series of four each, grouped in ribbon form. Each wire has a tensile strength of 250 lbs. each; at the cross-braces, they run over a 3/16″ radius. Only eight groups of wires and eight turnbuckles are required in the internal bracing system.

The cowling and propeller spinner are of "aerometal," having the tensile strength of sheet steel at one-third of the weight of steel.

Where engine cylinders project from the body, half-conical formers carry out a streamline.

The fuselage is designed to stand a load of 105 lbs. per sq. ft. of horizontal tail surface. Factor of safety, six.

Instruments carried are: Altimeter, tachometer, gasoline gage and oil gage.

Martin K III rudder and tail skid

Tail Group

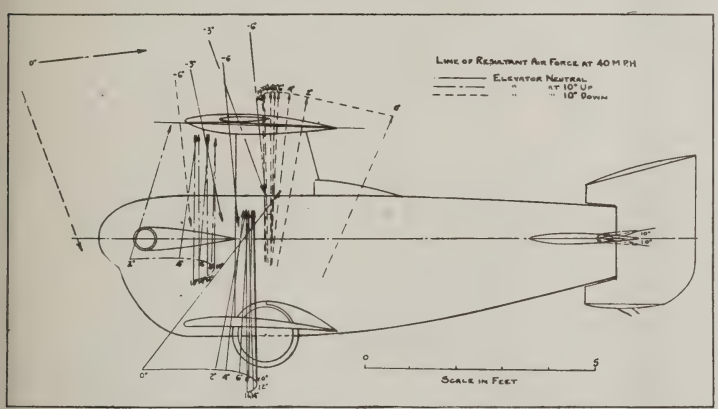
The horizontal stabilizer has a span of 7′ 6″ and width of 2′ 6″. Ends are raked at a 15° angle.

The stabilizer is located in line with the center of thrust. It is fixed at a non-lifting angle and supported from below by a pair of steel tube braces.

Elevators are 12″ wide and have an overall span of 7′ 10″. For rudder clearance, the inner ends of elevators are raked 30°.

Rubber covering between stabilizer and elevators closes the gap between the surfaces, giving a smooth, unbroken outline.

There is no fin.



The rudder is provided with balanced areas above and below the fuselage.

The tail skid is contained within the rudder. It is provided with rubber elastic shock-absorbing cord similar to the customary practice. It is especially effective when taxying on the ground. The combining of the rudder and tail skid does away with considerable weight and air resistance while adding to the effectiveness and simplicity of the construction.

The rudder is 1′ 10″ wide; maximum height, 3′ 5″; balanced portions project 8″ forward of the principal rudder area.

Flexible 3/32″ cable is used for operating the rudder, by means of the usual foot bar.

The elevators are actuated by means of a single ⅜″, 20-gauge steel tube from the control stick to a lever projecting downward from the center of member forming the elevator leading edge. The fuselage terminates beyond the elevator leading edge, providing space for the enclosure of the operating lever.

Graphic results of wind tunnel test of the Martin K III Single-Seater

Landing Gear

Ackerman spring wheels are used for the landing gear; these have 2″ tires, and are 20″ in diameter. The two wheels weigh 17½ lbs. Wheel track, 2′ 5″. When the chassis is extended, the underside of the fuselage at the forward end is raised 2′-3″ above the ground. When drawn up during flight, only the wheels are exposed.

The front of axle and the two forward struts have flat front faces, so that when in fiying position, these members fit flush into the fuselage bottom.

A hand-operated worm gear, operated during flight, causes the chassis to be retracted with practically no effort on the part of the pilot.

The landing gear has a factor of safety of 20.

Engine Group

The power plant consists of an air cooled two-cylinder opposed "Gnat" A. B. C. engine, developing 45 h.p. at 1950 r.p.m.

Fuel consumption, .56 lbs. per h.p. per hour; weight, 50.4 lbs. Oil consumption, .017 lbs. per h.p. per hour; weight, 1.55 lbs.

The fuel tank is located in the upper main plane above the fuselage. It has a capacity of 9.03 gallons, sufficient for a flight of two hours.

(*Continued from page 754*)

"Believing that the time is here when aircraft can be used to great advantage and saving of time for carrying passengers and express, a group of prominent and public spirited Americans have asked me to establish and take complete charge of the first permanent passenger and express aerial lines.

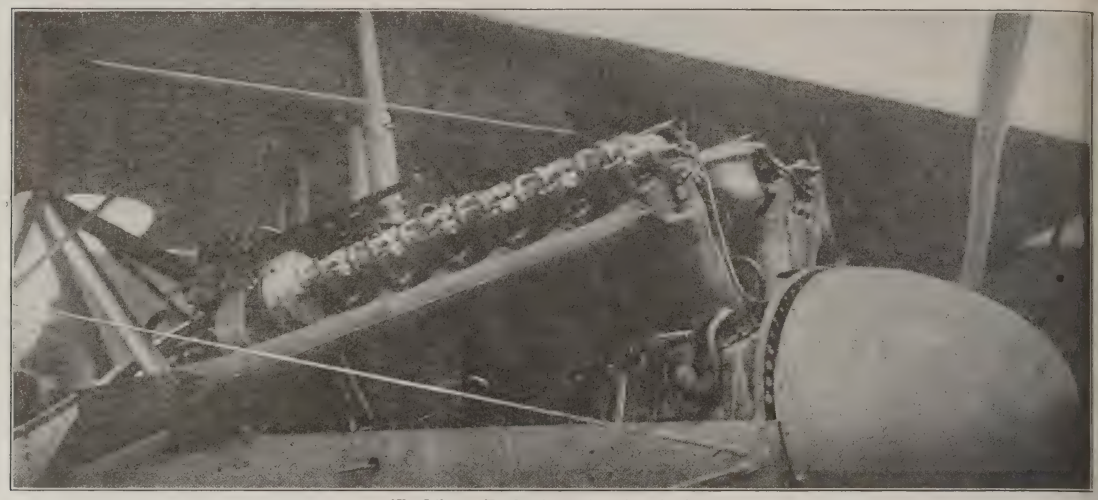
"I agree with them that it would be a splendid achievement and that it would be very appropriate to take this initial step December 17—the fifteenth anniversary of the first aeroplane flight made by Orville Wright at Kitty Hawk, N. C.

"It is our intention to put the first of these lines in operation May 15, 1919. We have gone into the details of the plan very carefully, as we realize that the demand for aerial transportation lines no doubt will be very extensive."

Captain Lipsner said the planes would be capable of carrying forty passengers of their weight equivalent in express matter; that rates would be nominal and within the reach of all; that a regular schedule of arrival and departure would be maintained and that all modern conveniences would be offered to patrons, such as wireless telephony, stationery and all latest scientific appliances.

The company will carry its own insurance for passengers and cargo.

A regular schedule of departure and arrival will be maintained. At a later date announcement will be made of what rebate will be offered for every minute the air craft is late.



Perishable goods and express will be carried during the first year's operation.

Aeroplanes can be chartered for special trips or for certain altitudes.

Only the most expert aviators will be employed.

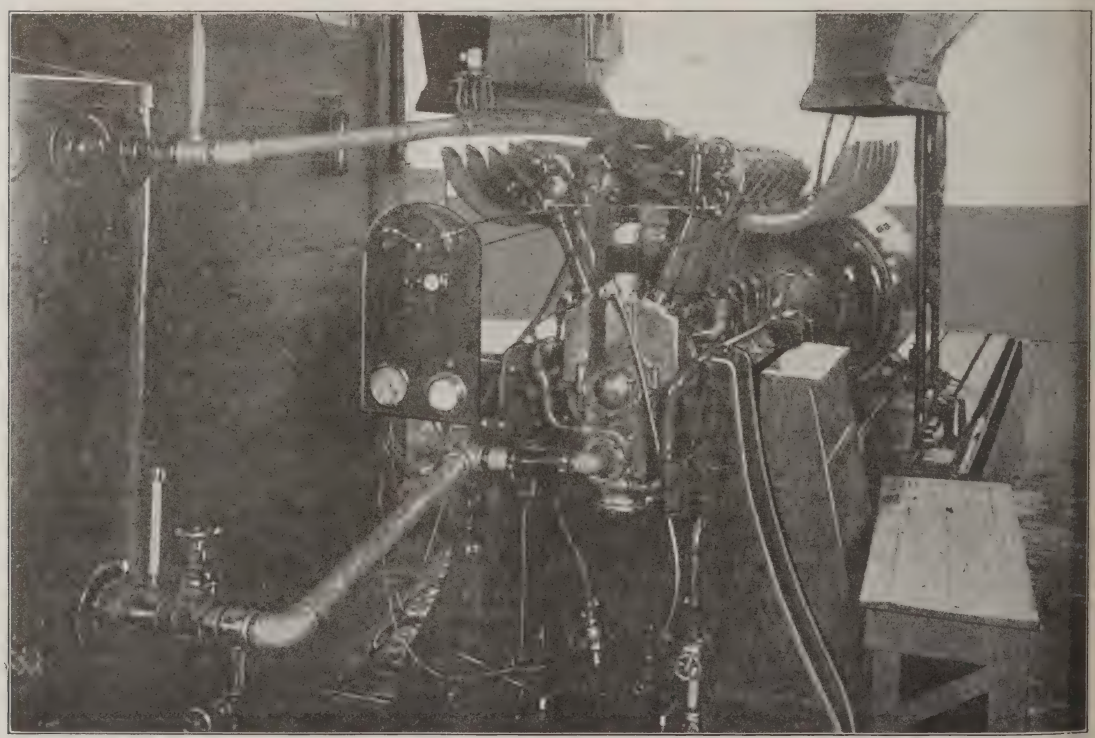
Pilots will receive an interest in the company besides substantial salaries, the interest only in force when all rules and regulations are strictly obeyed.

Representatives and officials of the press and aeronautical bodies will be taken on the first round trip flight.

The Liberty Twelve in an American Biplane

THE LIBERTY MOTOR

By G. DOUGLAS WARDROP, M. S. A. E., A. S. M. E.



(*Continued from last issue*)

Oiling System

THE oiling system in the Liberty Twelve is an interesting feature, as will be seen from the illustration.. The crankshaft is hollow, and in the center of each main bearing a radial hole is drilled through the shaft into the hollow center. This hole in the shaft registers with the corresponding hole in the bearing bushing, once every revolution of the shaft, at which time a small quantity of oil is forced through into the hollow crankshaft. A passage leads from each hollow main bearing to the adjacent crank pin, which is also hollow. A radial hole is also drilled through each crank pin and carries the oil out on the surface of the pin. Oil grooves and passages in the connecting-rod bushings insure proper lubrication for both the forked and plain connecting rods.

The excess oil thrown off the rapidly-moving connecting rod ends forms a mist which lubricates the piston pins and the cylinder walls.

Part of the oil conducted to the main crankshaft bearing at the propeller end of the engine goes through a passage around this bearing and up through pipes to the propeller end of the camshaft housings. From the end of the camshaft housings it is led around the end camshaft bearing to a passage drilled diametrically through the bearing

Liberty Twelve on a Sprague dynamometer testing stand at the Trego Motors Corporation plant

midway of its length. Once every revolution of the camshaft a hole drilled through the camshaft into its hollow center registers with the oil passage through the bearing.

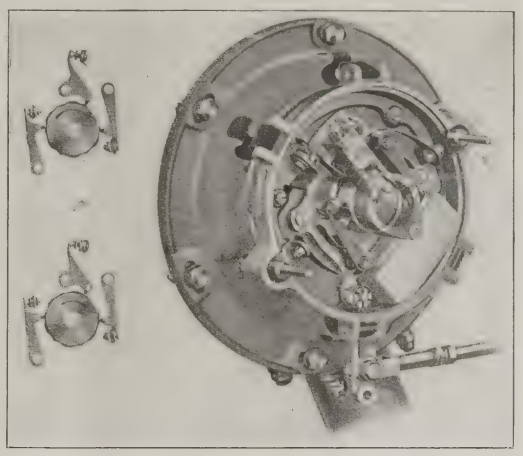
Thus once every revolution a small quantity of oil is forced into the hollow camshaft.

The oil is led through the camshaft and out through holes drilled in it to each camshaft bearing. The excess works out of the ends of these bearings and collects in small reservoirs to a depth of about ¼". The cams, in revolving, dip into this oil and splash it over the cam rollers and into pockets in the rocker-lever shafts. From these pockets it is led through the hollow rocker shaft to the rocker-shaft bearings.

The excess oil eventually finds its way to the gear end of the camshaft housings, over the gears and down the driveshaft housing into a chamber just above the oil pump.

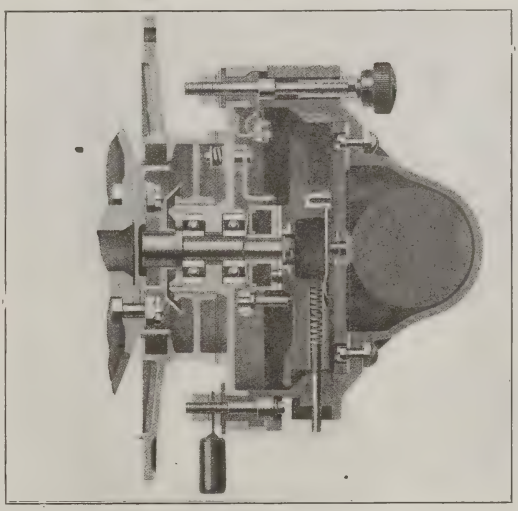
The excess oil thrown off in the crankcase by the connecting rods collects in this same chamber when the engine is inclined so that the propeller end is high. If the propeller end of the engine is low, this oil collects in a small sump or chamber at the propeller end of the crankcase.

Immediately above the oil delivery pump is located an oil return pump consisting of three gears, and driven by the same shaft as the delivery pump. The function of this oil return pump is to draw excess oil out of the crankcase and return it to the oil reservoir. One-half of this pump draws oil from the sump at the propeller end of the crankcase and the other half draws oil from the sump at the distributor end of the crankcase. Both halves of the pump deliver oil to the connection on the left side of the oil pump body marked "Oil Out," from which point it returns to the oil reservoir.



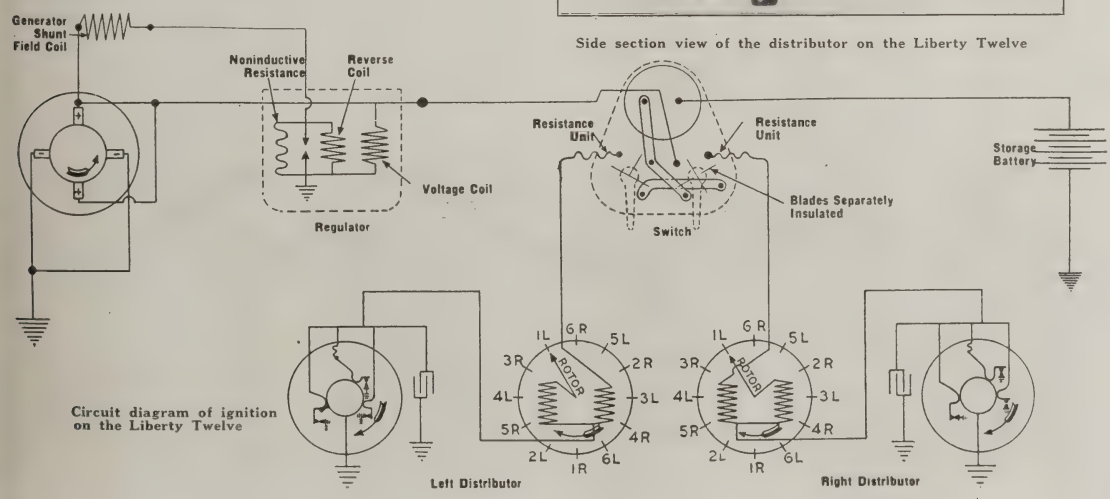
Electric Ignition

As was stated in our last issue, the ignition system used on the Liberty Twelve is known as the generator-battery type. Described in detail, the system comprises two independent braker and distributor mechanisms or heads, identical in every respect and each one firing all twelve cylinders. These distributors are supplied with electrical energy from two sources. For starting and for idling speeds up to 650 r.p.m. current is drawn from a specially constructed four-cell storage battery. The battery is very light and carries very little liquid or electrolyte (barely enough to fill a hydrometer syringe besides what is absorbed by plates and separators). Nevertheless, it has sufficient capacity to ignite the engine at full speed for three hours. It is so constructed that, even though it be turned upside down, it will still continue to function properly.



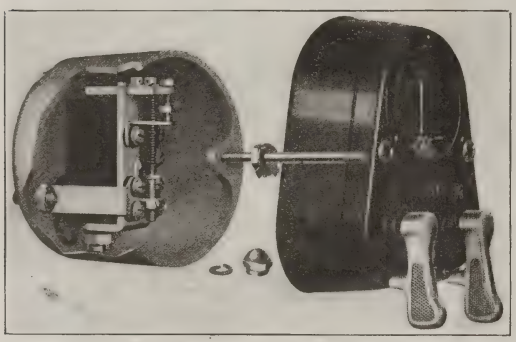
In addition to the battery, a positively driven generator is provided, so geared that it runs at one and one-half times crankshaft speed. Electrical energy for starting and idling speeds is supplied by the battery. As the engine speed is increased the generator "builds up" and its output grows greater, until at about 650 r.p.m. the generator voltage equals that of the battery. The maximum generator output exceeds the requirements for ignition so that at speeds above 650 r.p.m. the direction of flow of current is reversed and the excess output of the generator goes to recharge the battery. With an almost discharged battery the rate will be about 10 amperes, but will diminish as the battery voltage rises until the battery is completely charged, when the charging rate will be just sufficient to maintain it in a properly charged condition.

The generator is controlled by a "voltage regulator" which prevents the output exceeding a pre-determined figure. In view of this fact, the generator will supply current for ignition indefinitely, without the battery, so long as the engine speed is not allowed to drop below 500 r. p. m.

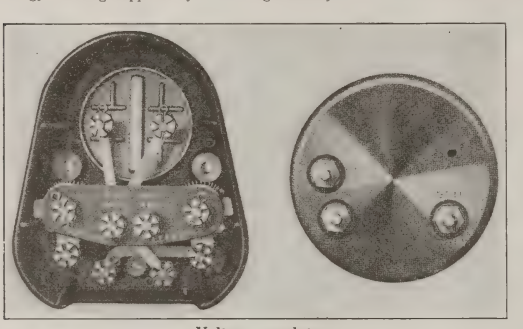


A duplex ignition switch is provided which will permit either one or both distributors being turned "on." This switch is so constructed that

The distributor mechanism of the Liberty Twelve



Side section view of the distributor on the Liberty Twelve



Circuit diagram of ignition on the Liberty Twelve

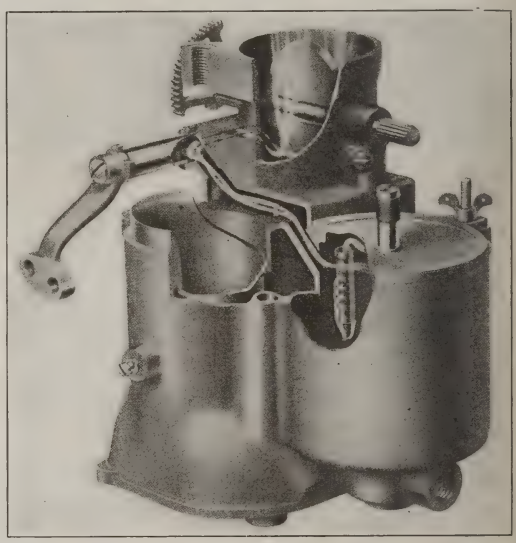
either set of ignition alone can be used without connecting in the generator. In starting, only one side should be used, as, with both switches "on," the generator is connected to the battery. Under these conditions the discharge from the battery through the generator before the engine is started would be an excessive drain on the battery. It is essen-

The voltage regulator on the Liberty

tial that both switches be "on" at all flying speeds. The ignition switch has an ammeter incorporated in it and this ammeter should be watched occasionally, as it indicates the amount of current flowing to or from the storage battery. If the ammeter shows a discharge at any speed above 650 to 700 r. p. m. with both switches "on," it is an indication that something is wrong with the generator circuit and that all electrical energy is being supplied by the storage battery. If the ammeter stands

Voltage regulator

at zero under the same conditions it indicates that the storage battery is not receiving a charge, but that the ignition is being carried by the generator.



To return to the distributors—the circuit-breaker mechanism for each head is identical with that used in any high-grade magneto, with two exceptions, as follows:

Two main circuit breakers, connected in parallel, are provided instead of one. The two breakers are timed to operate simultaneously and are provided in duplicate as a precautionary measure.

An auxiliary circuit breaker, the function of which is to prevent the production of a spark when the engine is turned backward or "rocked" is also provided. This auxiliary breaker is connected in parallel with the other two through a resistance unit which reduces the amount of current flowing through it. The breaker is so timed that it opens slightly before the other two when the engine is turned in a forward direction. The opening of the main breakers then results in the production of a spark. When the engine is turned in a backward direction the two main breakers open first and no spark is produced, due to the fact that the current continues to flow through the coil through the auxiliary breaker, but in diminished quantity, due to the resistance unit. By the time the circuit is opened at the auxiliary breaker the intensity of the magnetic field of the coil has weakened to such an extent that no spark is produced. A transformer coil is incorporated in the Bakelite cover of each distributor head.

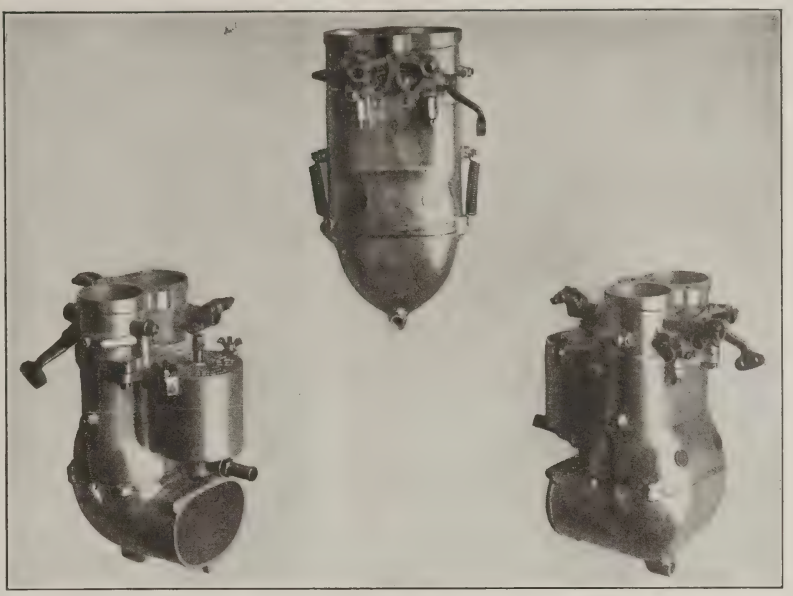
The Part of Zenith in the Liberty Aircraft Engine Programme

The first important decision of those engineers who were called upon to design an aeroplane engine which would uphold America's Air Pro-

Section diagram of the Duplex Zenith Carburetor

gramme was to incorporate only those things in their engine that were of proven and established quantity. It was therefore only natural that in considering the important matter of carburetion that the Zenith engineering force was called upon to design the Liberty Engine Carburetor.

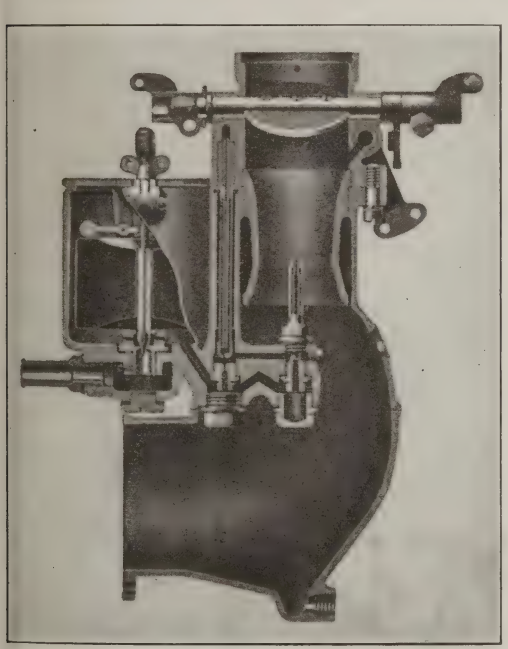
The first Liberty tested on Pikes Peak. In the group are L. J. Hall, of the Hall-Scott Co.; Lynn Reynolds, U. S. Inspector; V. I. Shobe, of the Zenith Carburetor Co.; Ferdinand Jehle, of the Aluminum Castings Co., and E. L. Graham, U. S. Inspector



The Zenith organization, always progressive, were pioneers in aeronautical carburetion. Their early experience was with Anzani, whose aero engines created a sensation in the early days and made possible some of the most important advances in the science of flying heavier-than-air machines. In America the Zenith was long ago adopted by Curtiss, and the unvarying reliability of the Zenith instruments assisted greatly the Curtiss advance to undying fame in aeronautics.

When the great war broke out in Europe Zenith was used, among others, on the aeroplane engines built by Salmson, Isotta Fraschini, Renault, Peugeot, Clerget and Lorraine-Deitrich, and was quickly adopted as standard equipment on the Hispano-Suiza engine, which leaped to a first place in the yet unbeaten Spad machine.

It is easy to understand how the combined efforts of Zenith factories located in France, England, Italy and America, interworking in their experiences, should lead to the development of the last word in carburetion. With all this experience, and results of combined efforts before this, the Zenith designers, V. R. Heftler and H. de



Boischevalier, developed a carburetor which met with the instant approval of the engine designers and which, when tested on the first Liberty Engine in July, 1917, justified the faith put in them and their product.

Immediately after the successful 50-hour test of Liberty 12 Engine No. 1 at Detroit, an experimental expedition composed of E. J. Hall, one of the Liberty Engine designers; Lynn Reynolds, of the National Advisory Committee for Aeronautics; E. L. Graham, I. A. & A. E.; V. I. Shobe, of the Zenith Carburetor Company; S. Smith, of the Hall-Scott Motor Company, and Ferdinand Jehle, of the Aluminum Castings Company was sent to Pike's Peak, Colorado, to make tests of the Liberty Engine at various altitudes. These were very carefully conducted and were run at altitudes above sea level of from 6,000 feet at Colorado Springs, to 14,109 feet at the summit of the peak. They demonstrated effectively the suitability of the engine for its destined purpose, and, incidentally, justified the selection of the Zenith carburetor. A very noteworthy fact is that the carburetor adjustment, which was determined as giving maximum power and efficiency on the electric dynamometer test at the Packard factory in Detroit, approximately 200 feet above sea level, gave the best results on the summit of Pike's Peak, 14,109 feet above sea level. This is only possible with a carburetor of plain tube construction and having the natural automatic compensating feature made possible by the Zenith system.

Three views of the Zenith carburetor equipment on the Liberty

After exhaustive tests had resulted in the final details of adjustment and installation production was started at the Zenith factory. The Zenith

Section diagram of the Zenith carburetor

manufacturing department, already experienced in high-class accurate workmanship and productive ability, carried on the good work started by the engineering department, and with such success that by November 1st, 1918, when Liberty Engine production had reached its peak, there had been delivered to the engine manufacturers a quantity of these instruments which was in excess of requirements to the extent of a month and a half of engine production according to the schedules then in effect.

Two of these carburetors are used on each Liberty 12 Aircraft Engine, they being of Duplex type, i. e., each having two carbureting chambers, or barrels, supplied from common air and fuel sources. Each barrel has a venturi tube for measuring its proper amount of air; one main or variable flow jet, and one compensating or constant flow jet. These are of non-adjustable type, being fixed once and for all, two carbureting chambers, or barrels, supplied from common air and fuel sources. Each barrel has a venturi tube for measuring its proper amount of air; one main or variable flow jet, and one compensating or constant flow jet. These are of non-adjustable type, being fixed once and for all, and so close are they calibrated that each and every Liberty Engine has its carburetors fitted with the same sized jets. With the exception of the altitude adjustment, which is incorporated in the design of Zenith aeronautical instruments to take advantage of the lesser air density met with at high altitudes and thus perform the important function of saving fuel and increasing the radius of action of the aeroplane, these carburetors have identically the same principle of operation, and same disposition of jets and venturi, as is used in Zenith commercial instruments.

The altitude adjustment mentioned above consists merely of a valve, connected so as to be manually operated by the pilot, which, when opened, puts the interior of the carburetor barrels below the throttle, where a partial vacuum exists, in communication with the fuel chamber. The suction from the barrels reduces the pressure in the fuel chamber and thus causes a decrease in the amount of fuel passing through the jets. At approximately 18,000 feet altitude this adjustment makes possible a saving of about 30% in fuel consumption, or, in other words, increases the radius of action of the aeroplane by 30%.

Immediately preceding the signing of the Armistice the Zenith company had developed a carburetor which was adopted as standard equipment for the Eight-Cylinder Liberty Aircraft Engine, and which was slightly later to replace the original model on the Twelve-Cylinder engine, that was as much ahead of the original Liberty Engine carburetor as it was ahead of other aeronautical carburetors at the time of its adoption. Aeroplane development resulting in greater climbing angles and higher ceilings made necessary equal developments in carburetion to meet these newly imposed requirements. The two points of carburetion mostly affected were, first, the ability to function properly when tilted to extreme angles; and second, to have an extended range of altitude adjustment. Still utilizing the same proven principles of operation, but by changing manufacturing details and relative positions of jets, and by a new float mechanism design, these requirements were not only met, but were exceeded. With a carburetor of this type a Liberty Engine was successfully operated at maximum power higher than that obtained with the original instrument at fore and aft angles of tilting of 50°. A tilting of 45° sidewise is also possible with the engine on a stationary stand. (In flight this sidewise tilting, as met with in banking, does not affect the normal functioning of the instrument, due to the "bicycle balance," or the neutralizing of the force of gravity by the centrifugal force.) It is well worthy of mention that, with this new type of instrument, the power of the Liberty Engine was increased, and the fuel consumption was considerably decreased. In addition, and of importance, the heat loss through the jackets was appreciably reduced.

THE HISPANO-SUIZA AVIATION MOTOR

By E. H. SHERBONDY

The following article is one of the chapters of the first Textbook of Aero Motors written by the author and being published by the Century Company.

The author is the well-known authority on internal combustion engines and aeronautic engineering. He has made a thorough study of problems of aeronautic engineering, especially of power plants, and has applied his vast knowledge of engineering, including matallurgy, and his remarkable inventive genius to work out their solution. He has achieved remarkable results and this Textbook represents the only work issued so far which deals with all the elements of the problems of applying the internal combustion motors to aircraft.

Mr. Sherbondy is a consulting member of the Naval Consulting Board, consulting engineer to the Aeroplane Engineering Department of the Bureau of Aircraft Production, and well known as the author of important works on internal combustion engines and aeronautic and automobile engineering.

THE Hispano-Suiza motor is the product of the brains and genius of Marc Birkigt, a Swiss civil engineer, who commenced his motor work in the design and construction of the now famous Hispano-Suiza motor cars, at Barcelona, Spain, about 1906.

A factory was established shortly afterward in Paris, and the majority of the work was carried out there, as the factory was near to the material and skilled labor markets.

When the French government established the present system of tax rating on motor cars, in which the horsepower was considered a function of the bore only, certain motor car firms commenced the construction of small bore, long stroke motors, in this way increasing the horsepower for a given cylinder bore and evading the taxation. Competitions were inaugurated for motor cars, having as their basis, limiting the cylinder displacement.

The Hispano-Suiza Co. rapidly entered a place of first rank by winning many of these competitions and assured for themselves an enviable reputation amongst continental motor constructors.

When the Great War commenced, the Germans had already developed the now famous steel cylinders Mercedes and Benz motors, whose performance from every standpoint was far superior to aviation motors built in other countries.

The French at this period had developed the rotary steel cylindered, air cooled motors to a high degree of reliability, but their fuel and oil consumption was then and is now excessive.

The need for a non-rotating high powered motor was met in the Hispano-Suiza motor which were found so satisfactory and so far superior to other non-rotating motors offered for trial at that time, that the French, British and Italian Governments placed orders for large quantities of these motors.

Such important firms as Peugeot in France and Wolsely in England, gave up the building of motors of their own design to take up the construction of the 150 H. P. Hispano.

The Hispano motor has since been developed in a large number of sizes and types, for military aviation purposes, and fifteen different manufacturing companies in different part of the world have constructed more than 50,000 of these motors.

The design and construction is unique in many particulars, as will be seen from the following description.

The motors are built with eight cylinders, with cylinders forming a 90° V in every case. This angular setting of the cylinders results in absolutely uniform turning effort on the crankshaft, the power impulses being equally spaced from one another, at 90 degrees.

The motor is unbalanced only in the horizontal plane, but the magnitude of the unbalanced forces is so small as to not be noticeable in the actual operation of the motors.

The motors have been built in both direct and geared down types and operated at various speeds from 1450 R.P.M. to 2200 R.P.M.

The 150-180-200 and 220 H.P. types all have identically the same cylinders. The bore and stroke are respectively 120 x130 mm. or 4.72x5.12 inches. The variation in the H.P. is obtained by fitting large carburetors and induction pipes, the use of higher compression ratios and higher speeds in the high power types.

There have also been built in limited quantities, the 400 and 450 H.P. types with 16 cylinders. The various types, and characteristics of other sizes are given in the Table I.

Table 1

Type	Normal H.P.	Normal R.P.M.	Max. H.P.	Max.R.
150	150	1450	200	2000
180	180	1540	250	2240
200	200	1870	210	2200
220	220	1970	238	2200
400	400	1870	500	2240
450	450	1970	476	2200

Fig. 2 shows the Brake Horsepower curves of the 150, 180, 200 and 220 H.P. types, as well as the 400 and 450 H.P. types.

For the 150 H.P. type a 48 D. C. Zenith Carburetor is used, on the other types of higher H.P. the 58 D. C. Zenith Carburetor is used.

The 400 and 450 H.P. motors both have the crankshaft geared to the propeller shaft, through parallel trans of helical reduction gears, as is indicated by the diagram Fig. 3. It will be noticed that the crankshaft is divided into two independent units. By this artifice, the shaft size is kept the same as in the 200 H.P. type motor, the torque magnitude being only 50% of what it would be if a single crankshaft were used for the sixteen cylinders.

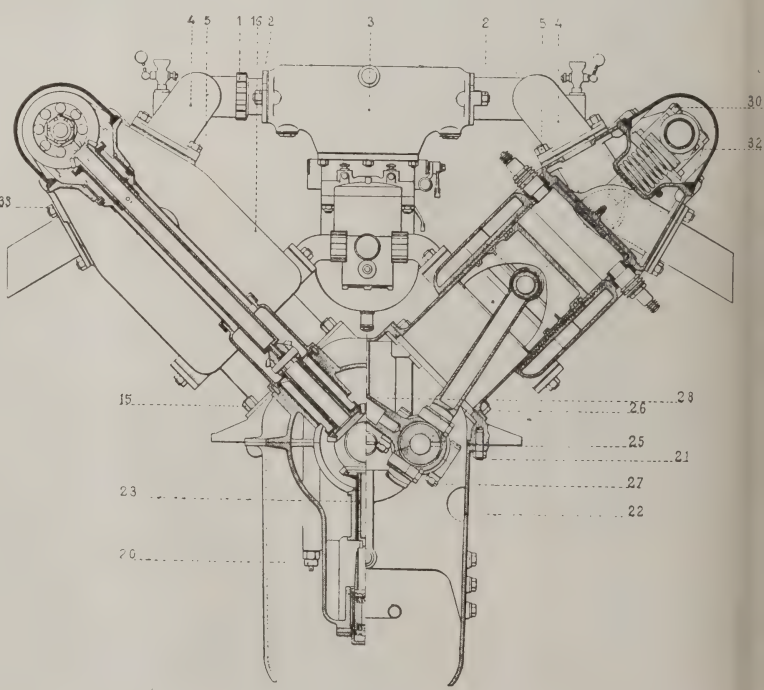


FIG. 1.

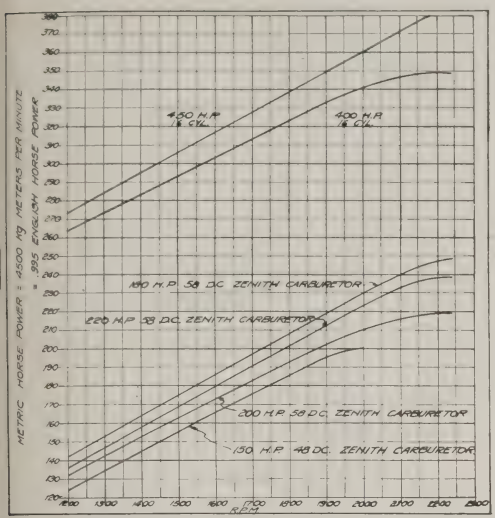

FIG. 2

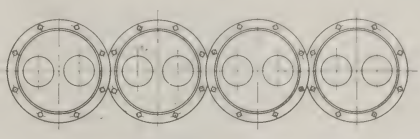
Fig. I is a section taken at right angles to the motor crankshaft of the 150-180-200-220-H.P. types.

The Cylinders



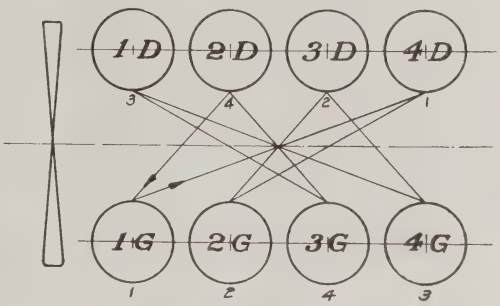
The cylinders are machined from hollow steel forgings of .40 carbon steel and weigh when rough about 40 lbs. for the smaller motors. Their finished weight is about 11 lb.

The cylinder form is a hollow barrel, with a closed end, into which the valve ports are cut. The cylinder walls have, when finished, an average thickness of 2 mm. or .078, and they are externally threaded from the closed end down, and the cylinder head is 5 mm. or .187 inches thick and the bolting flange, by which the cylinders are retained on the crank case is 6 mm. or .2362 inches.

The steel cylinder barrels are assembled in groups of four by screwing them into the cast aluminum water jackets, which are tapped to receive them. The steel barrel is put in the aluminum jacket after which the valve ports are machined in place, being located from the valve stem guides in the aluminum jacket. The bolting flanges are so designed as to interlock with one another when in place as is illustrated in Fig. 4.

After machining and putting in the steel barrels and valve seats the cylinder jacket is cleaned with alcohol and then given three coats of enamel inside and out, the bore is then given the final size by grinding.

It will be seen that a number of advantages accrue from this form of construction. Welding and the attendant possi-



METHOD OF INTERLOCKING BOLTING FLANGES

FIG. 4

bility of distortion are done away with, and the desirable features of great strength, together with minimum weight, is attained.

Some very ingenious processes have been devised to make the accurate production of these cylinders possible.

The lower portion of the camshaft housing and the oil

FIRING ORDER HISPANO SUIZA 8 CYL. MOTOR

FIG. 5

drain passages are formed in the top exterior of the jacket.

The intake and exhaust ports are both 51 mm. = 2 inches in diameter.

The French Spad biplane equipped with Hispano-Suiza motor

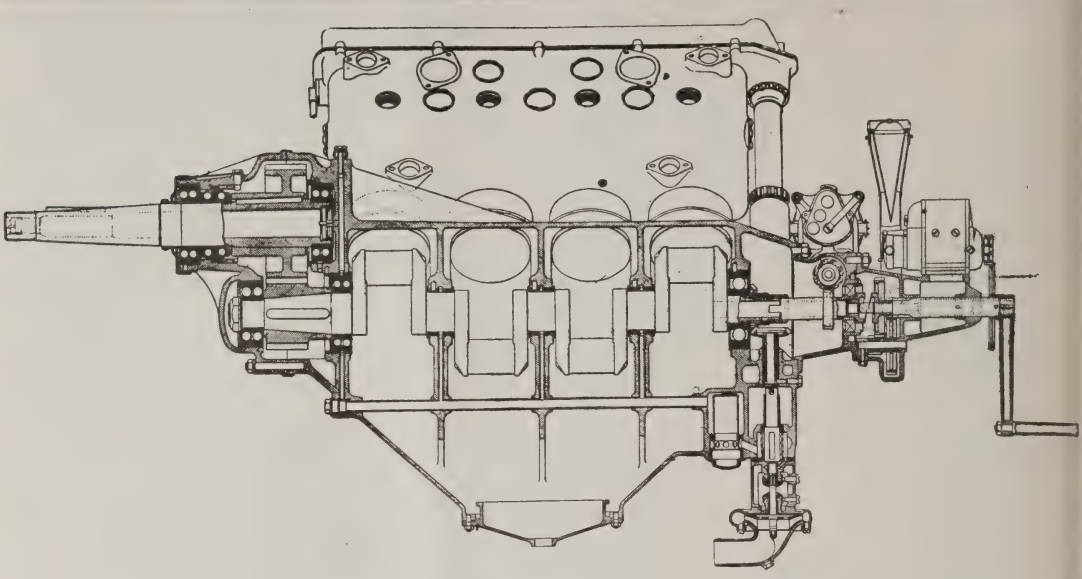


FIG. 6.

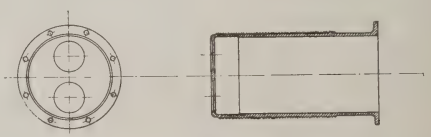
The exterior appearance is extremely clean cut, as can be seen from the accompanying illustrations.

The Pistons

The pistons are aluminum alloy sand castings, thoroughly well ribbed to assist in cooling. The piston head is flat and has an average thickness of 7 mm. (.2/5″). The piston skirt has an average thickness of 3 mm. (.118″), and carries three rings 5 mm. (.196″) wide, which are made of cast iron. Four narrow rings two in each of two grooves are placed above the gudgeon pin center and one below. The latter acts as an oil scraper ring. The location of the gudgeon pin center varies following the different compression ratios used.



The Gudgeon Pins are of Chrome nickel steel 30 mm. (1.181″) outside diameter and 22 mm. (.866″) inside diameter and are prevented from turning in the piston pin bosses by a single grub screw.

Connecting Rods

The connecting rods are of the forked type. The body of each rod is a tube 27 mm. (1.06″) outside diameter and 21 mm. (.826″) inside diameter, made by drilling straight through. They are made of B. N. D. Chrome Nickel steel, famed throughout the world for its wonderful physical properties. The top and bottom of the rods are profile milled to shape and polished all over.

The gudgeon pin bush in the small end of the rod is of phosphor bronze 57 mm. (2.24″) long, and has a wall thickness of 2.5 mm. (.09″).

The rods are 227 mm. (8.93″) centers, somewhat less than two piston strokes. Short connecting rods are the rule in aviation motors, since they enable the motor to be kept compact and light, although the secondary unbalanced forces in the motor are increased thereby.

HISPANO STEEL CYLINDER BARREL

Fig. 7

Crankshafts

The crankshafts are of the five main bearing type; the end bearings in the geared motors being single and double

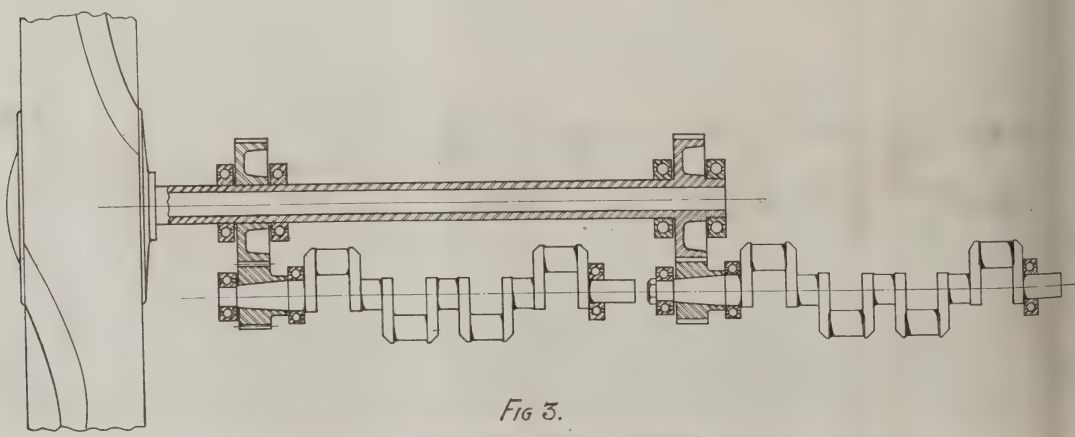


FIG 3.

DIAGRAM OF HISPANO SUIZA 16 CYLINDER PROPELLER SHAFT AND CRANK SHAFTS.

row ball bearings, the three intermediate bearings being babbitt lined bronze shells.

In the direct type motors only one single row bearing is used at the distribution end of the crankshaft, the use of which considerably reduces the length of the motors. The other bearings are of the plain type.

The average diameter of the main bearings in the motors of the 120 mm. (4.72") series is 58 mm. (2.28") and the crank pins are 50 mm. (1.98") diameter and 64 mm. (2.51") long.

The Distribution

The valves are placed in the top of the cylinder and are arranged in a single line parallel to the axis of the motor.

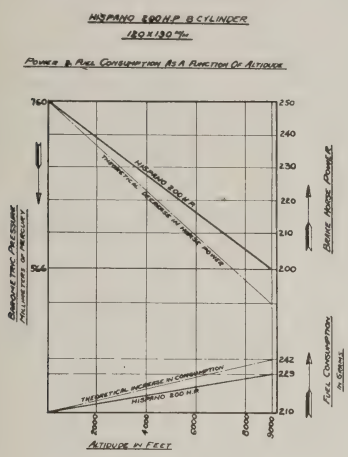

Fig. 8

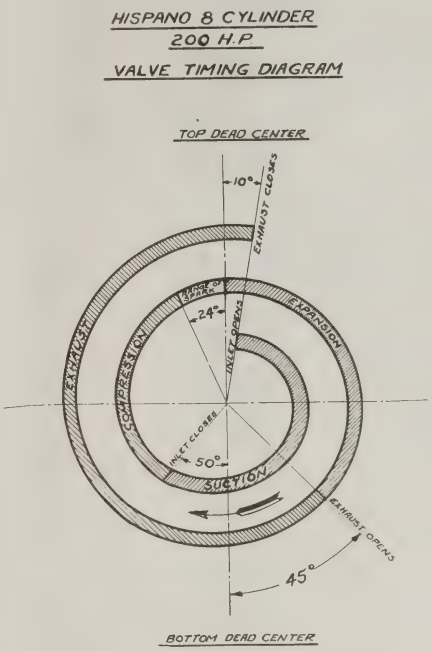
A single camshaft serves to operate all the valves in each group of cylinders. The camshaft is carried in three bronze bearings, front bearing 40 mm. (1.57"), center bearing 60 mm. (2.36") long, rear bearing 52 mm (2.04") long, all 34 mm. (1.33") in diameter. A 28 mm. (1.10") hole is drilled through the shaft and serves as an oil gallery for the distribution of oil to the bearing surfaces and cam faces. The cam faces are 16 mm. (.629") wide, and are undercut on the back side of the cams.

Each cam acts directly on the valve stem, into the end of which is screwed a case hardened contact plate, which is prevented from turning by means of tandem plate, face keyed to the valve stem and knurled to engage the lower face of the case hardened cam contact plate. Adjustment of the clearance (which is exceedingly large 2 to 3 mm. (.07"-.11") is easily made by means of a special wrench furnished for the purpose.

The camshaft is driven by means of a pair of bevel gears 2.5 module, 15 mm. (.59") face, having a ratio of



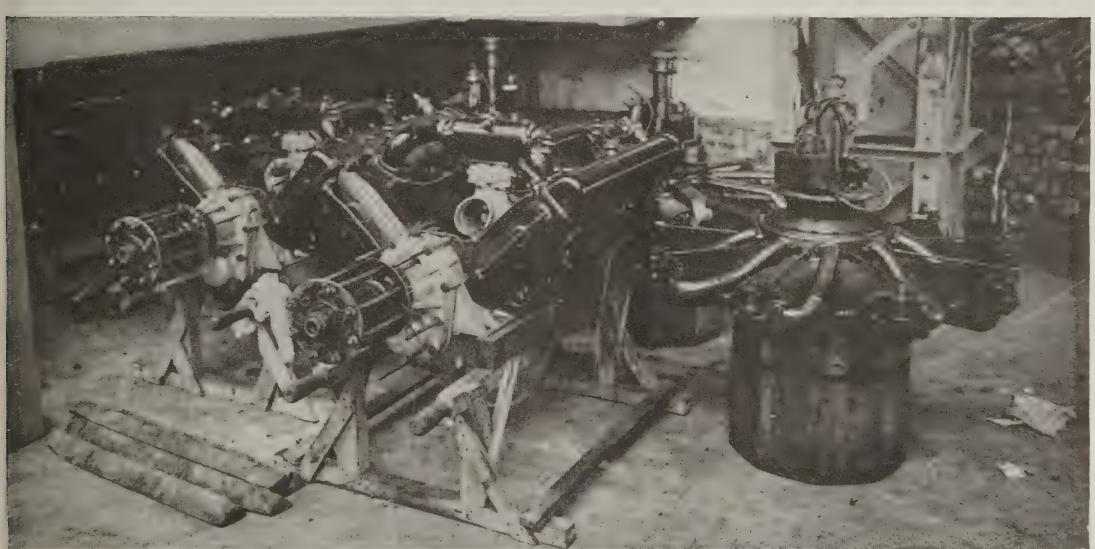


Fig. 9

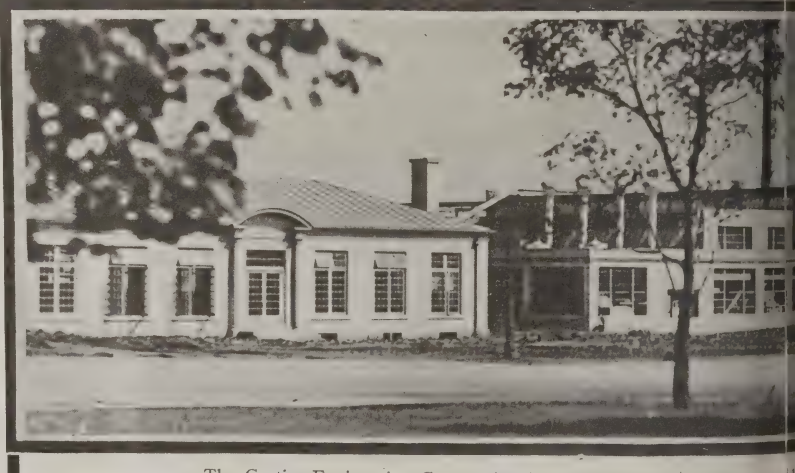
Two Hispano-Suizas and an Anzani in the French factory ready for shipment



"THE OP

Curtiss Achievements"

1—The design and construction of the fastest fighting airplane ever flown. Th Government records credit this triplane, which was built for the U. S. la known as model 18-T, with 160 miles per hour, carrying full military loac and passenger. This is 15 miles per hour faster than any speed ever claim an airplane, a truly epoch-making achievement, made possible by the develo of our new model K motor.

2—The design and construction for the Navy of the largest flying boats in the w colossal crafts capable of carrying five tons useful load. It was one of these that recently carried fifty passengers.

3—The design and construction for the U. S. Navy of the fastest and most e Seaplane in service anywhere. This craft which is known as the Curtiss mode with Liberty motor, made an official speed of 126 miles per hour with full m load, armament, ammunition, pilot and passenger.

The Curtiss Engineering Corporation is today the center of aeronauti Glenn H. Curtiss and his engineers have been busy in drafting rooms, re of suitable commercial types. Aircraft especially designed for sportsman's workmanship and performance as Curtiss military planes have proved them

nited States Training Forces.

s instead of being decreased will be increased by the coming of peace.
els and shops in perfecting designs and carrying forward the production
peace-time purposes are already available and are as superior in design,

ION, Garden City, L. I.

15 to 36. The inclined pinion shaft is operated at high speed to reduce the torque.

The arrangement of the accessory drives varies in the different types of motors as will be seen by perusal of the several sectional drawings accompanying this description.

The Crankcase

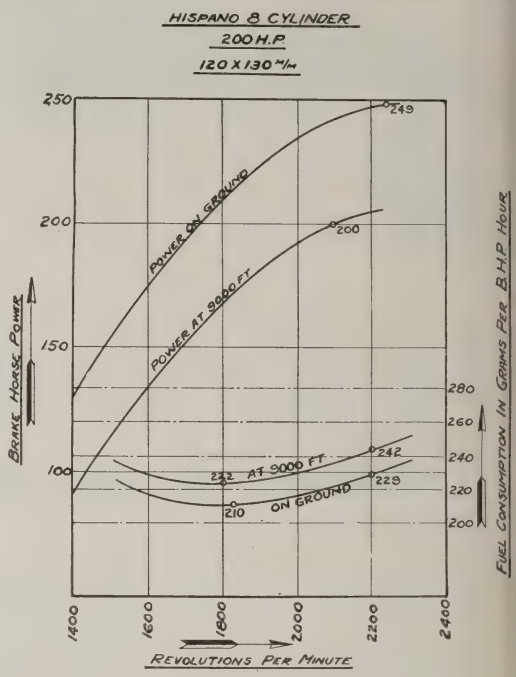
The aluminum crankcase is cast in two halves split horizontally through the plane of the crankshaft axis. The upper half is a very light shallow casting made possible by the use of short piston stroke and short connecting rods.

It is milled off on either side at angle of 45 degrees from vertical to receive the cylinder blocks.

All of the distribution gearing is of the bevel gear type excepting on the reduction gear motors where the magnetos are driven by a pair of spiral gears mounted in a bracket extending from the forward end of the crankcase.

The lower half of the crankcase carries the lower bearing seats and oil gallery pipes which feed the main crankshaft bearings. This casting is very deep, forming an oil reservoir having a capacity of 10 litres (2.6 gals.) in the eight cylinder 120 mm. (4.72″) type.

The two halves of the crankcase are bolted together by means of long, through bolts on either side of the main bearings as well as a series of bolts through the crankcase flanges.



The Valves

The valves are 55 mm. (2.16″) head diameter. The port diameter is 51 mm. (2″). The valves stems have two diameters, the lower portion adjoining the head is 10 mm. (.393″), the upper portion or guide portion is 15 mm. (.59″) in diameter and is drilled out to take the cam contact plate, which is screwed into the stem. The intake and exhaust valves are made of chrome-tungsten steel and are interchangeable.

Two concentric helical springs are used to seat the valves; this practice is universal in aviation motors. The valve guides are machined from bronze bars and are screwed into the aluminum cylinder jacket. They are interchangeable with one another.

Air Pumps

A low pressure pump is built into the camshaft housing cover and is operated by one of the cams, to provide pressure on the fuel tanks.

Tachometer

A tachometer connected is provided on the distribution end of one of the camshafts.

Lubrication

The oil occupation varies according to the type of motor as is indicated in Table 2.

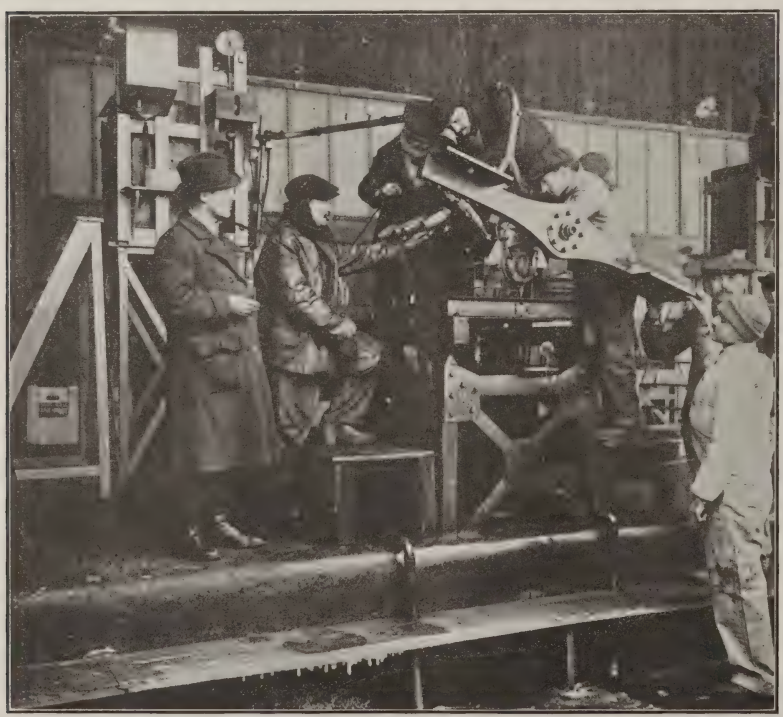


Table 2. Oil Consumption

Type	Litres per hr.	Gals. per hr.
150 H.P.	2	.528
180 H.P.	3	.792
200 H.P.	4	1.057
220 H.P.	5	1.321

The 120 mm. (4.72″) bore motors can be operated from two to three hours on the quantity of oil carried in the motor, but it is usual to provide an oil tank and to circulate the oil from the motor through the tank and back to the motor, thus getting the benefit of cooling the oil.

The pressure of the oil pump discharge in 5 kg. per sq. centimeter; the discharge line is 14 x 16 mm.; the suction line is 14 x 16 mm.; the leads to the main branch are 6 x 8 mm. The two leads to the cam shafts are 6 x 8 mm.; the groove around the main bearing bushings is 7 mm. wide and 4 mm. deep. Oil pump operates 1 1/5 motor speed. The reduction gear shaft radial and thrust ball bearings are oiled by the oil which is forced through the reduction gears. This oil also lubricates the ball bearings on the front end of the crank shaft (reduction gear end). The cam shaft bearings, cams and tappets are oiled by oil coming through the hollow camshaft which is under pressure.

Pistons, piston pins and rings are oiled by spray thrown off the crank shaft. The crank pins are oiled by pressure through three

A Hispano-Suiza undergoing block test in France

holes in each pin; 5 mm. center hole and a 4 mm. hole on either side of the center. See also size of the holes on the crank thrust, crank bearings and pins.

The distributing gears are oiled by the oil returning from the cam shaft housing to the under pan through the vertical shaft housing.

Oil Supply Tanks

If a tank is placed immediately underneath the motor the oil flows from the crank case into the tank through a 58 x 60 mm. tube. The suction pipe from the tank to the pump should be 14 x 16 mm. The air pipe from the crank case pipe should be 8 x 10 mm.

If the tank is in the top of the plane, the pipe from the drain plug is 20 x 22 mm.; the pipe from tank to pump to oiling points is under 5 kg. pressure and should be 14 x 16 mm.

Ignition

Ignition is provided by two spark plugs per cylinder set to fire synchronously. The current is supplied and distributed by two independent high tension magnetos which are cross-wired to the spark plugs, so that in the event that one unit is put out of operation, the motor will continue to fire on all eight cylinders.

The firing order is given in the diagram Fig. 5.

A hand starting magneto is provided to supply current when starting the motors. The current from this magneto is carried to the high tension distributors on the main operating magnetos and thence to the spark plugs.

Starting

Starting the motor is usually accomplished by swinging the propeller, but in certain cases, a reduction gear hand start is provided which engages the crankshaft at the end opposite the propeller.

Table 6 is a longitudinal section for the 200 and 220 H.P. types of motor, clearly illustrating the hand starting reduction gear and the propeller reduction gear.

Table 3 gives the principal characteristics of the reduction gears used in the 200 and 220 H.P. types.

Table 4 gives the H.P. weight, fuel and oil consumption and compression ratios used in the various types of motors.

The Cooling System

The motor is provided with a single centrifugal water pump having a single inlet and two discharge pipes. The water is led into the bottom of the aluminum jackets and out of the top, in contrast with the German method of pumping water through the top of the jackets only.

The centrifugal water pump has an inlet of 35 mm. in diameter and two discharges of 25 mm. each. Water enters the cylinder blocks at the bottom in the front end and discharges from the rear end at the top. The inlet and outlet holes of the jacket are both 28 mm. in diameter. The water space between the cylinders in the center is 12 mm. The radiator usually has a capacity of 40 L. The pump speed is 1 1/5 times motor speed, and the discharge is about 100 litres (26.5 Gal.) per minute at 1400 R.P.M.

When mounted in a plane, this motor is equipped with a thermostat to govern water temperatures; inlet temperature of 50 degrees centigrade; outlet 65 degrees centigrade; maximum permissible temperature 85 degrees centigrade.

Carburetors

Both Claudel and Zenith carburetors are fitted to Hispano motors, in every case comprising a single hermetically sealed float chamber and two independent mixing chambers into which are fitted various sized choke tubes and jets following the type and size of motor to which they are adapted.

In order to obtain the best possible motor performance, at each altitude the carburetors are equipped with a manually operated barometric control called the altimeter, by the use of which the mixture can be maintained at the best proportions of air to fuel. The actual function is to vary the pressure reigning in the float chamber and so reduce the effective head on the gasoline nozzle.

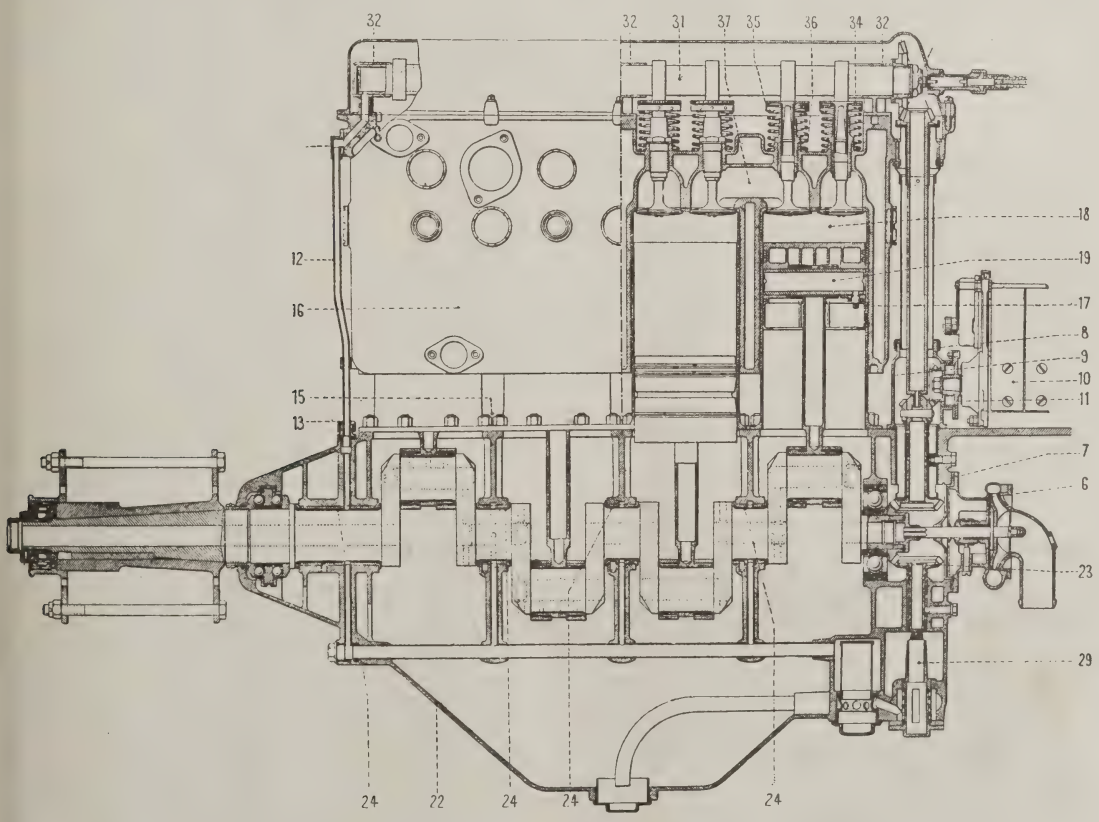

FIG. 10.

REPORT OF THE BUREAU OF AIRCRAFT PRODUCTION

By JOHN D. RYAN, Director

(May 24 to June 30, 1918.)

I.

CREATION OF THE BUREAU OF AIRCRAFT PRODUCTION.

Under date of May 20, 1918, by executive order of the President and by General Order No. 51 of the War Department, the Bureau of Aircraft Production was established.

The bureau was described as "an executive agency" which "shall exercise full, complete, and exclusive jurisdiction and control over the production of aeroplanes, aeroplane engines, and aircraft equipment for the use of the Army."

The order provides that such person as shall at the time be chairman of the Aircraft Board shall also be the executive o..cer of the Bureau of Aircraft Production. He is designated as "Director of Aircraft Production," and the order provides that he shall, under the direction of the Secretary of War, have charge of the activities, personnel, and properties of said bureau.

II.

AIRCRAFT BOARD.

From the date of the creation of the Aircraft Board by act of Congress approved October 1, 1917, to May 24, 1918, the Aircraft Board acted in an advisory capacity to the Secretary of the Navy and to the Chief Signal Officer of the Army, with respect to the purchase, production, and manufacture of aircraft, and made recommendations as to contracts and their distribution in connection with the foregoing.

The Navy has continued to function in its relations to the Aircraft Board in substantially the same manner as heretofore.

The board acts as a clearing house for information regarding aviation as between the Army and the Navy. The executive order of May 20, 1918, which gave to the Bureau of Aircraft Production the jurisdiction and control of the production of aeroplanes for the Army, recognizes the existence of the Aircraft Board in designating the chairman of that board as head of the Bureau of Aircraft Production, and neither enlarges nor diminishes the duties and functions of the board.

The Aircraft Board consists of the following:

Civilian members.—John D. Ryan, chairman; R. F. Howe, vice-chairman; and W. C. Potter.

Army Members.—Maj. Gen. W. L. Kenly, Col. E. A. Deeds, and Col. R. L. Montgomery. (Last two temporarily relieved.)

Navy members.—Rear Admiral D. W. Taylor, Capt. N. E. Irwin, and Lieut. Commander A. K. Atkins.

III.

ORGANIZATION OF THE BUREAU OF AIRCRAFT PRODUCTION.

In order to carry out the program and provide the equipment, the bureau is divided into seven main divisions:

(*a*) Executive.
(*b*) Engineering.
(*c*) Production.
(*d*) Spruce Production.
(*e*) Procurement.
(*f*) Finance.
(*g*) Advisory and Consulting.

The Executive Division directs the activities of the bureau.

The Engineering Division is responsible for the design of new models of aeroplanes and engines and all accessory equipment, necessary to meet the military requirements, and when developed to furnish models and drawings to the production department for the producing of quantities called for by the program.

The Production Division is charged with responsibility for the supervision of the production and inspection of all aircraft, including materials and parts therefor, for the investigation and selection of sources of supply, and for the conduct of all relations with contractors, with the exception of the production engineering, the execution of contracts, and matters of financial administration.

The activities of the Production Division are carried on by decentralization through district offices, which are established in various sections of the country where concentrated aircraft production is being carried on. By this means direct contact with the manufacturers is obtained and decisions can be rendered with the least possible delay.

It is of interest to note that aircraft requirements emanate from the Director of Aircraft Production for complete aeroplanes, engines, and accessories, and are set forth in an authorized program furnished by the Office of the Secretary of War, which states that certain types of aeroplanes and aeroplane engines in certain monthly quotas of each type are required, these types having previously been determined largely by the Air Forces overseas.

In connection with production, it is of interest to note what has been accomplished:

Aeroplane engine production.

	Total shipments to May 24	Shipments May 24 to June 30, inclusive	Total to June 30, inclusive
Liberty engines:			
Army type	622	994	1,616
Navy type	482	293	775
Total	1,104	1 287	2,319
Foreign combat engines:			
Gnome	179	30	209

Hall-Scott A7a	2,053	130	2,183
Lawrence	66	48	114
Total	6,377	1,394	7,771
Grand total engines	9,275	3,360	12,635

The foregoing figures show shipments from the factory.

In addition to this production, a certain percentage of spares have been included in the shipment of each type of engine.

Combat engines, consisting of the Hispano-Suiza 180 horsepower, and the Liberty 12, are in large quantity production, while the Hispano-Suiza, 300 horsepower, and the Liberty 8 are approaching actual production, and the output of each plant is being pushed to the utmost limit, as it is realized that this country is called upon to supply a large percentage of the requirements of the Allies in addition to equipping planes which are produced in this country. Sufficiently extensive tests of these engines have been made to warrant a feeling of assurance that they will be satisfactory in service.

Battle-plane production.

Total battle-planes produced to May 24, 1918..... 148
Total battle-planes produced May 24 to June 30, 1918..... 393

Training planes.

Total training planes produced to May 24, 1918..... 5,091
Total training planes produced May 24 to June 30, 1918..... 523

In addition to this shipment of aeroplanes there is a percentage of approximately 80 per cent parts shipped as spares for battle-planes and approximately 100 per cent as spares for training planes.

In order to show in further brief detail what has been accomplished in developing the manufacturing resources of this country in quantity production, a list is given below showing in part orders now placed and quantities shipped first up to May 25th, second up to June 29, 1918:

Articles or Material	Quantity ordered up to—		Quantity freighted up to—	
	May 25	June 29	May 25	June 29

(1) Included in above (2) No orders placed

[1]Program is for 1,000.
[2]1,000 ordered, 2,000 additional authorized but not ordered.
[3]Includes 46 from the Navy.
[4]Balloon fabric and airplane fabric.
[5]These figures taken from inspection returns.
[6]Does not include quantities shipped to allies.

Some idea may be gained from this list of the task of developing and getting into production the various products required by the Air Service, most of them never before having been produced in this country and representing a new art, to develop which both engineers and skilled workmen have to be trained and made proficient.

The manufacturers selected are entitled to the greatest credit for the cooperation and activity they have shown in turning over their existing facilities, and in many cases adding to these facilities in order to meet the requirements.

Recognition is also given to the hearty assistance accorded this bureau by other Government departments.

Special Allied Missions.

A special French Engineering Mission and a special Italian Engineering Mission have been brought to this country and are now engaged in the development of experimental aeroplanes of various types, which will be carefully tested and put into immediate production if satisfactory to the Air Service. The manufacturing facilities of this country are being rapidly developed for the production of complete battle-planes in quantity, and also for the production of finished parts, which will be sent overseas for assembly.

IV.

Spruce Production Division.

The output of spruce on the Western Coast is being rapidly increased, and in order to give an intelligent picture of the methods used in bringing about these results, the following figures on output are of particular interest:

Spruce.

	Feet
Total spruce shipped up to May 24, 1918	56,711,044
Total spruce shipped May 24 to June 30	8,413,542
Grand total spruce shipped	65,124,586

Fir.

Total fir shipped to May 24, 1918	19,216,012
Total fir shipped May 24 to June 30	6,181,737
Grand total fir shipped	25,397,749

Of the total shipments of spruce, 2,530,824 feet were shipped direct to England from the southern district.

Of the total fir shipped, 7,055 feet consisted of wing beams completely finished.

SPRUCE PRODUCTION PERSONNEL.

	On May 24	One June 30
Commissioned personnel	459	538
Enlisted personnel	12,382	17,697
Civilian personnel	71	70
Total	12,912	18,305

SPRUCE PRODUCTION CUT-UP PLANT.

In addition to the activities of the Spruce Production Division in getting spruce through regular lumber camp channels, a cut-up plant has been located on a government reservation at Vancouver, Wash. Work on this cut-up plant was begun December 24, 1917, and completed February 7, 1918.

The inception of the idea of a cut-up plant to supplement the sawmills was due chiefly to the necessity of manufacturing rived cants by those not having saw mills. The cut-up plant is now being used for the manufacture of aeroplane lumber from the entire log.

Machinery of the most modern type has been secured and scientific methods of manufacturing air craft material adopted. Circular head saws are being used in four of the six units of the mill, and band saws in the other two.

The logs and rived cants are shipped to the plant and are handled by the band saws, and the other units take the flitches from the sawmills in the woods. It is estimated that the cut at the mill can be run up to 9,000,000 feet per month.

In the plant the logs are cut to dimensions, which does away with the waste incident to transporting lumber across the country.

DRY KILN.

A dry-kiln plant of the Tidman pattern has been erected adjacent to the cut-up plant. The tremendous amount of material lost through checking in transportation and improper kiln-drying methods has been done away with by the installation of this plant. It is estimated that the saving in freight will pay for the erection of this plant within twelve months.

The plant consists of twenty-four modern kilns, each having a charge capacity of about 30,000 feet. The time of drying depends upon the size and condition of the wood, averaging form 12 to 30 days. The output of the dry-kiln plant averages 40,000 feet daily.

V.

FINANCES.

Total appropriations, obligations, and disbursements as of May 31 and June 30, 1918, for all aviation purposes and not confined to production:

Appropriations.

Increase for aviation, Signal Corps, 1918	$640,000,000.00
Signal Service of the Army, 1917-18, Aeronautics Act June 15, 1917	31,846,067.16
Signal Service of the Army, 1918, Aeronautics Act May 12, 1917	10,800,000.00
Total	$682,646,067.16

	To May 31, 1918	June 1 to June 30, 1918	Total to June 30, 1918
OBLIGATIONS			
Airplanes and spare parts	$195,193,636.18	$22,401,604.97	$217,595,241.15
Engines and spare parts	249,188,596.81	4,967,050.40	254,155,647.21
Balloons and accessories	11,071,431.52	274,249.28	11,345,680.80
General equipment	79,048,280.52	2,458,740.82	81,507,021.34
Acquisition of plants	2,595,599.83		2,595,599.83
Experimental and research	2,973,817.20	264,810.99	3,238,628.19
Total	540,071,362.06	30,366,456.46	570,437,818.52
Construction of buildings and flying fields, including purchase and lease of land, United States and abroad	68,956,838.35	2,961,061.64	71,917,899.99
Training, operation, and maintenance	92,358,991.33	17,035,930.40	109,394,921.73
Total	161,315,829.68	19,996,992.04	181,312,821.72
Grand total	701,387,191.74	50,363,448.50	751,750,640.24
CASH DISBURSEMENTS			
Airplanes and spare parts	76,257,253.08	7,464,198.94	83,721,452.02
Engines and spare parts	69,520,425.62	8,169,015.43	77,689,441.05
Balloon and accessories	1,718,082.71	422,397.47	2,140,480.18
General equipment	35,498,567.20	6,718,528.52	42,217,095.72
Acquisition of plants	1,036,952.54		1,036,952.54
Experimental and research	1,261,094.24	353,378.78	1,614,473.02
Total	185,292,375.39	23,127,519.14	208,419,894.53
Construction of buildings and flying fields, including purchase and lease of land, United States and abroad	57,642,578.62	4,666,352.26	62,308,930.88
Training, operation, and maintenance	82,335,163.18	20,254,400.05	102,589,563.23
Total	139,977,741.80	24,920,752.31	164,898,494.11
Grand total	325,270,117.19	48,048,271.45	373,318,388.64

It is of particular interest to note that there has been disbursed in cash up to June 30 a total of $208,419,894, covered by Air Service material, and a total of $164,898,494 for buildings, flying fields, training, and maintenance. Of this amount there have been cash disbursements of approximately $1,000,000 for experimental work on engines and planes at the McCook Experimental Field, Dayton, Ohio, and a cash disbursement of approximately $350,000 up to June 30 for special gas at the Fort Worth, Tex., Experimental Plant. In addition to this, there has been a total expenditure of approximately $200,000 in completing the development of the present battle planes so as to take advantage of American manufacturing methods and quantity production.

VI.

PERSONNEL.

One of the most difficult problems which continually faces the director of this bureau is the securing of the proper personnel to carry on the activities of this very specialized industry, about which so little was known in this country at the time war was declared. With the other activities of the Government, the problem grows more serious each day.

In order to convey an idea of what this problem is, a detailed set of statistics is given showing the enlisted, commissioned, and civilian personnel—first, in Washington, and, second, in the district offices or plants where aircraft is being produced.

Personnel in Washington (excluding Spruce Production Division).

NOTE:—Prior to Aug. 1, 1918, all enlisted men were of the Division of Military Aeronautics detailed for special duty in the bureau. They comprised master signal electricians; sergeants, first class; sergeants; chauffeurs, first class; chauffeurs; corporals; cooks; privates, first class; privates.

Key to Abbreviations

AAD—Assigned to active duty.
ABC—Report to Army Balloon School, Arcadia, Cal.
ABC—Report to Army Balloon School, Arcadia, Cal.
ADO—Report to Aviation Supply Depot, Dayton, Ohio.
ADT—Report to Aviation Supply Depot, Dallas, Texas.
AFO—Report to Aviation Supply Depot, Fairfield, O.
AGC—Report to Aviation Supply Depot, Garden City, L. I., N. Y.
AHT—Report to Aerial Gunnery School, Houston, Texas.
AIR—Transferred to the Air Service, National Army, without change in rank or date of commission.
ALF—Report to Camp Alfred Vail, Little Silver, N. J.
AMV—Report to Aviation General Supply Depot, Morrison, Va.
AOV—Report to School for Aerial Observers, Hampton, Va.
APR—Report to School of Aerial Photography, Rochester, N. Y.
ARV—Report to Aviation Supply Depot, Richmond, Va.
ASM—Report to Aviation Mechanics' Training School, St. Paul, Minn.
BFT—Report to Barron Field, Fort Worth, Texas.
BRN—Report to Bakers Field, Rochester, N. Y.
BST—Report to Brooks Field, San Antonio, Tex.
CAF—Report to Carlstrom Field, Arcadia, Fla.
CAP—Commissioned as Captain, Aviation Section, Signal Corps.
CDT—Report to Aviation Concentration Camp, Dallas, Texas.
CFT—Report to Carruthers Field, Fort Worth, Texas.
CGC—Report to Aviation Concentration Camp, Garden City, L. I., N. Y.
CGS—Report to Aviation Concentration Camp, Greenville, S. C.
CIT—Report to Radio School, Carnegie Institute of Technology, Pittsburgh, Pa.
CJS—Report to Camp Jackson, Columbia, S. C.
CJW—Report to Camp John Wise, San Antonio, Texas.
CLR—Commissioned as Colonel, Aviation Section, Signal Reserve Corps.
CMV—Report to Aviation Concentration Camp, Morrison, Va.
CPA—Commissioned as Captain Air Service, National Army.
CPR—Commissioned as Captain, Aviation Section, Signal Reserve Corps.
CRI—Report to Chanute Field, Rantoul, Ill.
CSO—Report to the Chief Signal Officer, Washington, D. C.
CUI—Report to School of Military Aeronautics, Cornell University, Ithaca, N. Y.
CWT—Report to Call Field, Wichita Falls, Texas
DAF—Report to Dorr Field, Arcadia, Fla.
DAP—Report to Director of Aircraft Production, Washington, D. C.
DIK—Report to Camp Dick, Dallas, Tex.
DIS—Honorably discharged from service.
DMA—Report to Director of MilitaryAeronautics, Washington, D. C.
ELA—Report to Eberts Field, Loanoke, Ark.
EOT—Report to Ellington Field, Olcott, Texas.
FLA—Commissioned as First Lieutenant Air Service, National Army.
FLR—Commissioned as First Lieutenant, Aviation Section, Signal Reserve Corps.
FLT—Commissioned as First Lieutenant, Aviation Section, Signal Corps.
FOB—Report to Fort Omaha Balloon School, Omaha, Neb.
FRF—On duty requiring regular and frequent aerial flights.
FSO—Report to Fort Sill School for Aerial Observers, Fort Sill, Okla.
GIT—Report to School of Military Aeronautics, Georgia Institute of Technology, Augusta, Ga.
GLC—Report to Gerstner Field, Lake Charles, La.
HHN—Report to Hazelhurst Field, Mineola, L. I., N. Y.
JMA—Rated as Junior Military Aviator.
JRC—Report to Jackson Field, Riverside, Cal.
KST—Report to Kelly Field, So. San Antonio, Tex. (When specified in the order, the number of the field is given in parentheses)
LDT—Report to Love Field, Dallas, Tex.
LHV—Report to Langley Field, Hampton, Va.
MAC—Report to March Field, Allesandro, Cal.
MAJ—Commissioned as Major, Aviation Section, Signal Corps.
MAT—Report to Mather Field, Sacramento, Cal.
MDO—Report to McCook Field, Dayton, Ohio.
MIA—Report to U. S. Naval Air Station, Miami, Fla.
MIT—Report to School of Military Aeronautics, Massachusetts Institute of Technology, Boston, Mass.
MJA—Commissioned as Major Air Service, National Army.
MJR—Commissioned as Major, Aviation Section, Signal Reserve Corps.
MSC—Report to Radio School, Maryland State Agricultural College, College Park, Md.
OBS—Attached to the Aeronautical Service as Observers.
OSU—Report to School of Military Aeronautics, Ohio State University, Columbus, Ohio.
PFO—Report to Post Field, Fort Sill, Okla.
PMT—Report to Park Field, Millington, Tenn.
PUP—Report to School of Military Aeronautics, Princeton University, Princeton, N. J.
PWM—Report to Payne Field, West Point, Miss.
REL—Relieved from present duty.
RSD—Report to Rockwell Field, San Diego, Cal.
RTR—Retransferred to organization attached to previous assignment to aviation duty.
RWT—Report to Rich Field, Waco, Tex.
SBI—Report to Scott Field, Belleville, Ill.
SAG—Report to Souther Field, Americus, Ga.
SGS—Report to Camp Sevier, Greenville, S. C.
SLA—Commissioned as Second Lieutenant Air Service, National Army.
SLR—Commissioned as Second Lieutenant, Aviation Section, Signal Reserve Corps.
SLT—Commissioned as Second Lieutenant, Aviation Section, Signal Corps.
SMA—Report to School of Military Aeronautics, Cambridge, Mass.
SMM—Report to Selfridge Field, Mount Clemens, Mich.
SRC—Report to Columbia School for Radio Officers, New York City.
TFT—Report to Taliaferro Field, Fort Worth, Texas. (When specified in the order, the number of the field is given in parentheses)
TMA—Report to Taylor Field, Montgomery, Ala.
UCB—Report to School of Military Aeronautics, University of California, Berkeley, Cal.
UIU—Report to School of Military Aeronautics, University of Illinois, Urbana, Ill.
UTA—Report to School of Military Aeronautics, University of Texas, Austin, Tex.
VBW—Report to Vancouver Barracks, Washington.
WAC—Report to Aviation Concentration Camp, Waco, Tex.
WCS—Wire to the Chief Signal Officer upon arrival.
WDM—Wire, Director of Military Aeronautics, upon arrival.
WFO—Report to Wilbur Wright Field, Fairfield, Ohio.

Notes

Note 1—Report to places mentioned in order named for temporary duty.
Note 2—Report to Air Service Headquarters, Fayetteville, N. C.
Note 3—Report to Air Service, Detroit, Mich., to the officer in charge.
Note 4—Report to Honolulu, T. H., to the Hawaiian Dept. for duty with the 6th Aero Squadron.
Note 5—Report to Aberdeen, Md., to Commanding Officer of the 271st Aero Squadron.
Note 6—Report to Chief of Tech. Section Dayton, Ohio.
Note 7—Report to Dist. Mgr. Aircraft Prod., Dayton, Ohio.
Note 8—Report to Bureau of Aircraft Prod., Air Building, Dayton, Ohio.
Note 9—Report to Students' Army Training Corps., Boston, Mass.
Note 10—Report to Commerce Building, Houston, Texas.
Note 11—Report to Chamber of Commerce Building, Indianapolis, Ind.
Note 12—Report to Air Training Radio Warehouse, Houston, Texas.
Note 13—Report to Aircraft Acceptance Park, Elizabeth, N. J., and wire DAP.
Note 14—Report to Emerson Field, Camp Jackson, Columbia, S. C.
Note 15—Report to Dist. Mgr. Aircraft Finance, 360 Madison Ave., N. Y. C.

NOTE.—No enlisted men assigned.

These figures show an increase in personnel from May 24 to June 30 of approximately 24 per cent.

VII.

SPECIAL MISSIONS.

In order to carry out a thorough study of European production of aeroplanes, engines, and accessories, a special mission was sent overseas in June, 1918. This mission consisted of experienced experts from the United States on engines, planes, electrical equipment, contracts, instruments, and accessory apparatus.

The great distance from the front makes it a vital necessity to have representatives on the ground who have had experience with actual production facilities of the United States and are able to convey to the Service in France the limitations of what can be accomplished in the way of improvements and changes and at the same time keep the stream of production continually flowing. The lack of such experts in this new art of aeroplane construction and operation has made it exceedingly difficult to use this means of communication in the past, as the few men with experience have had to be kept in the United States in order to train the men necessary to develop the production required.

The necessity for continued liaison service between France and this country increases daily, but with the rapid training of the men responsible for the direction of the various departments this situation should be materially improved.

The bureau has also started the practice of sending experts in production and inspection from the United States to study methods used by the allies and take advantage of their four years' experience.

An invitation on the part of the allies has been given to the manufacturing plants of the United States to send their officers and plant managers to Europe to study European methods and adopt from their practice what will be of advantage to supplement American methods.

W. C. POTTER,

Acting Director of Aircraft Production.

FOREIGN NEWS

Ambassador Page and Wife Fly in Dirigible

Rome.—Captain Guinaraess, of the Brazilian military aviation mission, has arrived and established headquarters here.

Ambassador and Mrs. Page were guests of Captain Guinaraess on board a dirigible December 14th.

Air Traffic Started Between German Cities

London.—Air traffic has been begun between some of the largest German towns, advices reaching here report. The aeroplanes are carrying parcel post matter and passengers. The fare per passenger is 2½ marks a kilometre or about a dollar a mile. The machines can fly at the rate of eighty miles an hour and the journey from Berlin to Munich, for instance, can be accomplished in 4½ hours.

One company is constructing a new, large type of aeroplane, able to carry forty passengers.

Aero Mail in India

The *Times* correspondent, writing from Simla on October 14th, says that the Government of India is considering a proposal to establish an aerial postal service in India.

The Transatlantic Flight

The first entry in Great Britain for the *Daily Mail* Trans-Atlantic prize was lodged with the Royal Aero Club on November 15th by the Whitehead Aircraft Co., Ltd. The machine is described as a Whitehead biplane fitted with four screws, each driven by a 400 h.p. Liberty engine. The machine, which is said to be nearing completion, is of 120 ft. span and an overall length of 65 ft., while the speed is expected to be in the neighborhood of 115 m.p.h. It is proposed to start early next year from Whitehead Park, Feltham, and replenish fuel tanks at Oranmore, Galway. Capt. Arthur Payze, R.A.F., is nominated as the pilot, and he will be accompanied by an assistant pilot, a navigator, and one mechanic.

The London-to-Paris Air Service

If promptitude counts for anything, the prospects for commercial aviation after the war are certainly bright, for scarcely had the armistice been established as an accomplished fact when it was made known that at least one firm is ready to inaugurate an aerial passenger service as soon as conditions permit. Mr. G. Holt Thomas, managing director of the Aircraft Manufacturing Company and various other enterprises, state that arrangements have already been made for a passenger service between Paris and London. As Mr. Holt Thomas points out, the fact the British celestial rights end in mid-Channel will practically preclude all-British companies from establishing international air routes, and for aerial mail routes at any rate the rights of both countries concerned in the enterprise will have to be considered.

With regard to the proposed London-to-Paris passenger service, the arrangements at English end will be in the hands of Aircraft Transport and Travel, Ltd., a company registered by Mr. Holt Thomas, and which is under the same direction as the Aircraft Manufacturing Co., Ltd., and other aviation enterprises in which Mr. Holt Thomas is interested. In France the interests of the company will be looked after by an allied company, the Compagnie Générale Transaérienne, of which M. Henri Deutsche de la Meurthe is President. It is proposed to make the Ritz Hotel, Piccadilly, the starting point at this end, while the French terminus will be the Ritz Hotel, Place Vendôme, Paris. The time-table that has been drawn up, and which, with the machines it is proposed to use, it should in most cases be quite possible to adhere to or even to improve upon, is as follows:

Departure by motor car, Ritz Hotel, London.....	10.00 a. m.
Departure from London aerodrome	10.30 a. m.
Arrival Paris aerodrome	1.00 p.m.
Arrival Ritz Hotel, Paris	1.30 p. m.

The fare has at present been fixed at 15 guineas, which will, it is expected, include an insurance for £1,000 for each passenger.

The first ticket at £15 15s. was purchased on Friday by the Hon. Sir Arthur Stanley, M.P., chairman of the Red Cross Society, while other purchasers of tickets on that day were Mr. E. Manville, chairman, Associated Chambers of Commerce; Mr. Percy Martin, managing director, the Daimler Co.; Mr. Julian Orde, secretary, Royal Automobile Club; Mr. H. J. Irish, Sir John and Lady Shelley Rolls, Lieut. Guy A. Reed, U.S.; Mrs. Robert Rankin (three tickets), the Hon. Kathleen Robson (two), Mrs. Alec Tweedie, Mr. A. E. Nathan, and Mrs. Locke King.

The machines to be used at first will be of a type that was designed for quite a different purpose, *i. e.*, for long-distance raids into Germany, but with very little alteration they will be very suitable for the more peaceful purpose to which they are now being put. Like all the other famous machines produced by the Aircraft Manufacturing Co., they were designed by that firm's distinguished designer, Capt. Geoffrey de Haviland, whose designs have played such an important part in the aerial supremacy of the Allies over Germany. These machines are twin-engined bombers, but not of such a large size as others which have been employed for long-distance bomb raids. They are, however, very fast—somewhere about 130 m.p.h.—so that it may be confidently expected that, except under extraordinarily bad weather conditions, an average speed over the ground of 100 m.p.h. will be maintained.

Night Stops On Islands Proposed for Trans-Oceanic Aeroplanes

Crossing the ocean and continents in aeroplanes not equipped with sleeping facilities is proposed by the "Rivista Del l'Aviazione," an aviation review published in Italy, according to the Italian Bureau of Public Information. The review figures that small, swift aeroplanes, even though they would have to stop for ten hours at night for the sleep of the passengers, could cover more ground in less time than a large aeroplane which would not have to stop because it carried its sleeping accommodations with it.

Practical examples of how long flights could be made are given. The lightest aeroplanes and those of small dimensions have at present a velocity of from 112 to 135 miles an hour. By flying fourteen continuous hours, the review figures that in a single flight, without alighting, it is possible to traverse from 1,550 to 1,900 miles, which is greater than any single stretch of ocean without intervening islands. Many small ocean islands could be converted into dormitories for aeroplanes and their passengers. The hours lost in alighting and stopping on the islands would be made up for by the greater speed made possible by the light weight of the aeroplane.

Aerial flights, the review further observes, even though made less swift because of the nocturnal stops, would still represent a great saving in time when compared with steam and rail trips. The most rapid transatlantic steamer today requires four days to complete the trip from England to the United States. An aeroplane would require, including a nocturnal stop on the Canary Islands, Bermuda or Newfoundland, not more than two days. The crossing between Europe and South America, with nocturnal stops at the Canary Islands, Madeira, Asuncion and Trinidad, would require not more than four days, calculating fourteen hours of flight to ten of rest.

Tests of these proposed flights without sleeping on board will soon be made, according to the review, in flights between Europe and India. These may even be inaugurated before the conclusion of the present war.

The development and perfection of these small planes need not mean the exclusion of the larger ones, of which the Caproni are typical. The review pleads for the development of all types of aeroplanes, large and small. Gianni Caproni, designer of the famous huge Caproni aeroplanes, recently published the designs for two new triplanes with cabins de luxe and accommodations for twenty-four passengers. The review does not question their success, but it would like to see developed simultaneously with them the small, swift aeroplane, which it believes will prove supreme in transportation after the war as it has in warfare.

Italian Veneer-Wood Industry

Veneer-wood, a manufactured wood used especially in aeroplane construction, the Italian Bureau of Public Information states, is now being manufactured on a large scale in Italy, whereas formerly almost the entire amount used in Italy was imported from Austria. With the establishment of many factories in the northern part of Italy and a few in the south the manufacture of veneer-wood may now be called a national industry.

The many uses of this wood for war purposes have resulted in its production on a large scale. Veneer-wood is a composition of three strata of thin wood placed upon one another with the fibres running in opposite directions. This gives to the wood greater resistance in proportion to its weight than any other wood known. The combination produces a strong wood, which is light in weight, is elastic and still keeps its shape. At present it is extensively used in aeroplane and hydroplane construction.

The only factory for veneer-wood in Italy before the war had an output of about 100 square yards a day. At present, with the introduction of modern machinery, the national output has been increased to more than 5,000 square miles daily.

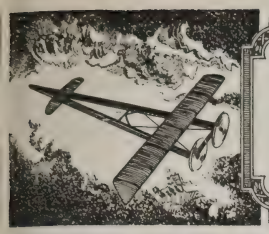
A New Observation Balloon

Italy's success in aviation, according to the Italian Bureau of Public Information, is no longer a subject of discussion; not only the individual records of Italian aviators speak for themselves, but also the daily work of the Italian planes on the Italian or French fronts are hard facts that the world at large concedes. The Caproni, the Fiat, the Ansaldo, and the Pomilio companies are daily producing many aeroplanes, and the Italian aviation has actually a record of speed in production, efficiency and thoroughness. But not only in aviation, but also in aeronautics Italy has come to the front. There is, for instance, a new observation balloon that is now about to be used by all the Allied armies, which is the invention of an Italian army officer, Major Brassoni, of the Italian Army Engineers. The particular merits of this balloon are the extraordinary stability and its powers of suspension. Moreover, a most important factor, there are absolutely no metal parts exposed that might cause any damage by electricity. This allows the observers to stay up even in an electric storm without any more than the average danger of being, for instance, on a tree. The observer's basket communicates with the crew on the ground by means of a wireless telephone. Six months ago this balloon rose to a height of 16,000 feet over London, which in itself was a record for an observation balloon.

Aero-Navigation in Europe

Notwithstanding the cold, matter-of-fact wording of the report of the Italian Permanent Commission for Aeronautics, the fact remains, says the Italian Bureau of Public Information, that a wonderful, almost impossible dream of a near past has been declared not only a possibility, but will be a reality before long. The committee reported "that the plans for the regular aero-navigation between the various capitals of the Allied nations and that of the subsidiary lines across the Mediterranean have been approved."

Pushes Aircraft Surrender



London (British Wireless Service.)—The surrender of the 2,000 German aeroplanes required under the terms of the armistice convention has been proceeding the last week, and it is expected that the full complement of enemy machines will soon be in the Allies' hands.

The taking over, examining, and parking of so vast a fleet of machines has necessarily taken time, as the German armies in their retirement are leaving the planes behind in their evacuated aerodromes. Difficulties and attempted evasions connected with the precise proportion of the types of aircraft to be turned over and the air worthiness of some of the machines surrendered are being adjusted in response to firm representations by Marshal Foch on behalf of the Allies.

Some light is thrown upon what this gigantic surrender of aircraft means to the Germans by the official British figures of air fighting upon the British western front from January 1, 1918, to the date of the armistice. These figures show the number of enemy machines destroyed in aerial combats by the British to have been 3,060, while enemy machines driven down out of control numbered 1,174.

Germany is known to have lost well over 6,000 aeroplanes, destroyed and surrendered, in the present year.

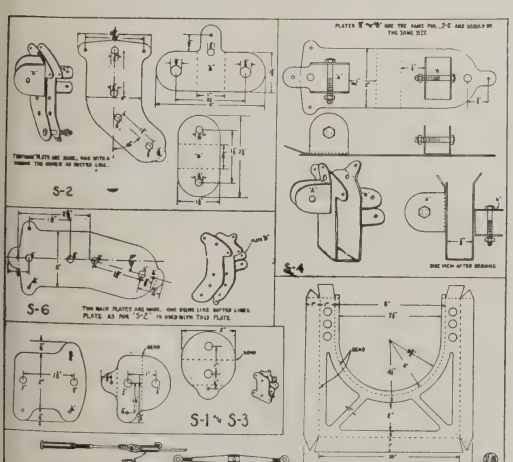
On the other hand, the resources of the Allies are being reinforced by 2,000 German machines of modern type and in good condition.

ELEMENTARY AERONAUTICS and MODEL NOTES

By John F. McMahon

Model Aeroplane Building as a Step to Aeronautical Engineering

The fuselage is braced with No. 30 Piano Wire drawn up taut by the use of turnbuckles. The sections at the pilot's seat and to the rear are tightened with the bicycle type as illustrated previously while the sections around the engine and wings have regular small size turnbuckles. When fastening the piano wire to the turnbuckle a nipple is used to hold the hook in place, the wire being bent to a small loop and the end slipped through the nipple after which it is bent over, as shown in the sketch at the lower part of the picture. The regular turnbuckles should be no longer than 4". Before bending the wires it would be better to measure the correct distance from one terminal point to the end of the turnbuckles, having the turnbuckle wide open, then making the loop around a jig of some kind. The turnbuckles bracing the sides of the machine should be up near the top of the fuselage to enable one to get at them easily should they loosen and have to be taken up.



The special fittings S-1, S-2, etc., should be made. These are constructed of sheet steel .10 inch thick. The correct sizes and shapes can be had by consulting the drawings. S-1, and S-3 are for attaching the upper struts in place. The combination consisting of three plates made to the sizes given and then assembled as shown in the sketch. S-2 is the rear landing chassis strut and wing fitting combined. Two plates of the same size and shape and two separate plates, one for the inner bracing strut, the other for the wing fastening and flying wire attachment. When making this combination one should be made left-handed and the other right, that is when making it, have the wing attachment on the right hand side on one fitting and on the left hand side for the other. The bolts for these fittings are ¼" S. A. E. thread and case hardened if possible. S-4 is for the forward wing attachments and you will notice that the landing chassis plate is missing and the wing plate is higher as in the strut fitting inside. This fitting will need a filler block of wood between the two main plates just above the longeron.

S-6 is for the forward landing chassis strut and engine strut. No wing fitting is needed as you will see. When assembling, the plates they should be welded or carefully riveted together.

A nose plate for the front of the machine is shown also with dimensions.

The conrols and landing chassis are next to be considered.

(To be continued)

Details of metal fittings for the Ford motored tractor

The Smallest D H 4

The accompanying photograph shows what is supposed to be the smallest D H 4 battle plane known. This model, although having the general appearance of its big battle plane prototype, is only 9" span and was built by the Model Editor for Mr. Henry Woodhouse as a radiator ornament. The model was used as a sample for castings which are to be made in order to build a quantity of these machines.

The body is made of solid wood, the wheels of turned aluminum, the struts of $^{3}/_{32}$" tubing and the planes, tail, and rudder of tin. The struts, wires, and planes are fastened with solder. The propeller is free to revolve, which it does when the automobile is moving. The fastening for the model consists of a horseshoe-shaped strip of ⅛" x ½" brass, which is clamped around the filler of the radiator by means of a bolt, while at the other end is fastened a ⅛" drill rod threaded and which passed through the body at the gunner's ring after which the nuts are tightened and the model is held rigidly.

Mr. Attilio Di Sabato of the AERIAL AGE staff photographed the model.

A D.H.4. Radiator Ornament

Notice to Readers of This Page

It is our intention to have a contest for construction and flying of models to begin the first of the year. The editor would like to hear from every model builder who is a reader of this page, so that we might line up the names of those who wish to take part in the contest. In fact, it will be well for all model readers, whether flyers or not, to communicate with the editor, so that we might be able to arrange some other kind of a contest for their benefit. Let us hear from you even if it is only a postal card with your name and address on it.

During the war many model flyers who were called to the colors did not have as much time to devote to model flying as they might have had, but now that peace is in the air they will come back and study aviation more seriously than ever.

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

"'E Ain't No Bloomin' 'Ero"

You can talk about the infantry, the cavalry, artillery, the tank men, and the rank men, and the rapid firing squads; but the boys who do the fixing, when your darned old "carb's" not mixing, are the greasy old mechanics, and they ask no man for odds.

No medals they'll be getting, no cheers, or public petting, but you'll find them in the front line—when you need them, they'll be there. With a monkey wrench and hammer, midst the battle's roar and clammer, they're the guys that keep the army's eyes, the flyers, in the air.

Oh, his overalls are greasy, but when your engine's wheezy, he's the doctor that can fix it, you can bet your life on that. Tho' he has no gun for shooting, and no one his horn is tooting, he is serving Uncle Sammy with the "bean" beneath his hat.

So Here's to you, "Motor Mech", may you always be on deck; and serving Uncle Sammy, in your own peculiar way. Tho' you get no public petting, it's ten to one in betting, that "Bill" will know you've been there when he has his debt to pay.—Exchange.

Platsburg Officer—Mr. Blank, explain the moving pivot.

The Rookie—A moving pivot pivs; and, having pived, moves on.

The longer we stick around the human hemisphere the more we realize Uncle Jake, who sowed a few oats in his day himself, hit the spike squarely on the bean when he said: "Tomorrow's flight depends a whole lot on your take-offs today.—Plane News.

The New Nursery

Pussy cat, Pussy cat, where have you been?
I've been up in a flying machine.
Pussy cat, Pussy cat, what have you seen?
I saw our aviators drop bombs on Berlin.
—By H. C. Wirth (with apologies to Mother Goose Nursery Rhymes).

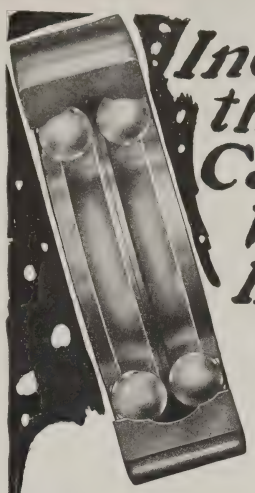
Leonard Wood, Major General U. S. A.

As combat's roar and din subside
And battle's smoke is blown away
We see a figure by our side
Whose life is open as the day.

A patriot and a soldier true
He sensed his country's peril great
Too proud a soul to bow or sue
He spoke his mind to land and State.



The pigmies that he tried to aid
Misunderstood his nature grand,
And fated him to never fade
From hearts of countrymen and land.

His martial soul was on the Mons
His spirit fought at Thierry's Grove
He stands among his country's sons
Full decorated by their love.

We owe a debt of gratitude
To Leonard Wood, it's hard to pay,
His chance destroyed by party feud
Will come again as bright as day.

For history's unerring eye
Has seen and chronicled the facts
And it will all his foes defy
By simply pointing to his acts.

GEORGE L. UPSHUR.

Increases the Load Capacity Without Increasing the Size

SUCH a statement unaccompanied by an explanation of how we are able to accomplish it, is hard to understand.

How to increase the number of balls in a bearing without adding to the size of the journal or weakening the races is one of the problems that has bothered engineers for years.

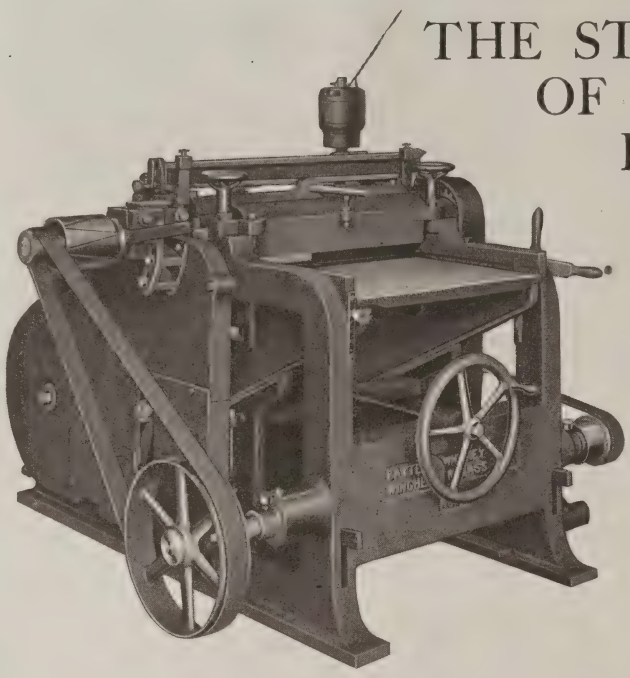
The method of solving this in the

CARWEN

Double Row Ball Bearings

is so simple and practical that it is a wonder someone did not think of it long ago.

To assemble or dismount, the inner race—which is made in two halves, but finished exactly like a solid piece—is rocked so that the balls can be inserted without cutting any "side filling" openings or resorting to the uncertain "built-up" construction.



Carwen double row Bearings are made in the standard No. 200, No. 300, and No. 400 series to interchange with all makes of single row bearings; as well as in our "Heavy Duty" type, to interchange with other makes of double row bearings. This latter bearing will withstand a thrust load equal to 100 per cent of its radial capacity.

THE STRONG POINTS OF WHITNEY PLANERS

appeal to every wood-worker, such as a

RIGID FRAME with ample weight of metal—

BED raised and lowered on Solid Wedges operated on wide tracks—

HARDENED CENTER TABLE made extra thick—

AUTOMATIC CHIPBREAKER working concentric with the Cutter Head—

CLAMP CUTTER-HEAD BOXES easily removed from the machine—

CUTTER HEAD with long bearings of large diameter.

These are but a few of the features that enable Whitney Surfacers to do superior surfacing at the lowest cost.

We Make Liberty Motor Pistons in Quantities

AS one of two sources of supply for aluminum alloy die-cast pistons, officially designated by the U. S. Signal Corps, we made and are making large quantities of both Army and Navy type Liberty Motor pistons.

We are the pioneer manufacturer of aluminum alloy pistons, which have been and are being used by the most prominent airplane, automobile and marine engine manufacturers in this country and Europe.

Years of use prove the unequalled advantages of our piston metal. Our service is prompt and reliable. Let us quote on your requirements.

Liberty Starter

Approved and Now Being Made For U. S. Naval Hydroplanes

Weight, 49 pounds complete.
Cranks motors up to 500 horsepower.
The device itself weighs but 30 pounds.
It is entirely self-contained without brackets or other gearing, bolting direct to crankcase of engine, and cranking direct to end of crankshaft.

A small air cylinder, 1¼" x ¾" with piston running continuously for air pressure on gasoline feed tank is combined with the device and entirely independent in action. This starter furnished with or without it at option.

Information regarding these trials given on request.

THE simplicity and reliability of the Liberty Starter for Airplanes are due to the fact that compressed air, the most reliable and easily controlled motive force known, is the actuating energy.

Where chances of starter trouble cannot be taken, as, for instance, on naval seaplanes, this type of starter is equipped. Liberty Starters have been thoroughly tested by the U. S. Navy, and are used on U. S. Naval Planes. (See list of tests made.)

The Liberty Starter is an air motor for starting, and a compressor to store air for its own energy in starting. It is entirely self-contained; couple direct to end of crankshaft of motor; needs no alteration in motor or gear reduction, and has ample power for magneto starting. It is the *one* efficient, *dependable* type of starter for airplanes to-day.

We welcome comparative tests, and will gladly arrange for any kind of trial for the Liberty Starter.

"NORMA" PRECISION BALL BEARINGS

(PATENTED)

Estimate the serviceability of a machine by the staying power of its weakest part—that it is which sets the limit of service. Analyze it for the essentials. Follow the factors in serviceability through every detail, to the small parts which—while seemingly insignificant—yet determine the capacity of the machine as a whole for maintaining its performance.

The bearings of the electrical accessories of airplane, car, truck, tractor, or power boat determine the service capacity of these machines. Which explains why "NORMA" Precision Bearings are the standard bearings in the ignition apparatus and lighting generators always preferred where maximum service is sought.

Be SURE. See that your electrical apparatus is "NORMA" equipped.

VOL. VIII NEW YORK, DECEMBER 30, 1918 NO. 16

GENERAL MENOHER, A NEW CHIEF OF AIR SERVICE

THE appointment of Major-Gen. Charles T. Menoher, who commands the 42d (Rainbow) Division in France, as Director of the Air Service, succeeding John D. Ryan, was announced on December 21 by General March.

Colonel James A. Mars has been named Acting Director of Aircraft Production, succeeding William C. Potter.

General March explained that these two details brought the producing machinery of the aviation service back into the permanent military organization.

General Menoher is now on his way home to take up his new duties. General Menoher's record as division commander during the active fighting led to his assignment as commander of the Sixth Army Corps some time before the signing of the armistice.

Colonel James A. Mars is a Regular Army officer, at present chairman of the demobilization of the Department of Military Aeronautics. He has been in command of a number of Army aviation fields and is known to be a progressive officer.

Assignment of these Regular Army officers to posts in the Air Service previously held by civilians is because, in the forthcoming staff reorganization plans, the Air Service will be treated as an integral part of the existing establishment and not as a separate service.

THE AERO CLUB OF AMERICA TO SEND AERIAL EXPEDITION TO EXPLORE ARCTIC

ONCE more the Aero Club of America shows its progressive leadership, by an undertaking which is considered by leading scientists as the most stupendous ever conceived, as it means nothing less than starting to explore, survey and map 8,000,000 miles of the earth's surface by "Aircraft."

The Board of Governors of the Aero Club of America, of which Rear Admiral Robert E. Peary is a member, has decided to back Capt. Robert A. Bartlett, the famous explorer, in equipping and sending to the Polar regions the most complete expedition ever sent out in the history of the world.

This expedition will have as its aim the stupendous task of exploring and surveying the unknown Polar regions, as well as exploring the depths of the Polar Basin and the upper air of the Arctic regions.

The Board of Governors of the Club decided to back such an expedition after giving considerable study to the subject. A committee has been studying the conditions and the possibilities for the past two years and made a preliminary report to the Club a few days ago, on December 17, urging the Board on that date, the fifteenth anniversary of the first flight, to undertake this stupendous task, which is considered by explorers and scientists as the most complete and ideal expedition ever conceived.

The Committee which studied the conditions and reported to the Board of Governors of the Club consisted of Rear-Admiral Robert E. Peary, discoverer of the North Pole; Alan R. Hawley, Henry A. Wise Wood, Henry Woodhouse, Rear-Admiral Bradley A. Fiske, John Hays Hammond, Jr.; Rear-Admiral William N. Little, U. S. N.; Professor Charles L. Poor, Colonel E. Lester Jones, U. S. A.; Charles Jerome Edwards, Major Cushman A. Rice, U. S. A.; Augustus Post, Major J. C. McCoy.

It is expected that the Expedition will cost about $250,000, which sum will be raised by a committee of prominent members of the Aero Club of America in the near future.

The co-operation of the leading geographical societies and scientific bodies is assured, and the plans are to have this expedition leave the United States in June 1919, to take advantage of the period of warm weather which exists in the Arctic regions for six weeks in the summer.

Further details regarding the project were given out by Mr. Alan R. Hawley, President of the Aero Club of America, today, who said:

"It is most amazing to find that for a period of the year in the Arctic regions the weather is not as cold as it is in New York during the months of October and November, and that the plan to fly across the top of the earth would really be a comparatively easy thing to do.

"There are six weeks of fair weather in July and August, when, even in the Polar regions, it is seldom lower than sixty degrees above zero. The plans are to have a ship go to Etah, about 600 miles from the North Pole, in June, when the ice is sufficiently broken to permit the ship to cross Melville Bay. The ship would carry a large seaplane or land aeroplane for the final flight across the top of the earth and for exploration of the unexplored Polar regions, as well as smaller planes for the scouting flights.

"Immediately upon arrival at Etah, a base would be established, and while waiting for the ice to break up further north to permit the ship to go as far as Cape Columbia, the small seaplanes would fly to Cape Columbia and establish a base there for the large plane, which is to be used for the flight across the top of the world, from Cape Columbia on the American side, over the Pole, to Cape Chelyuskin on the Siberian side, and for exploration over longer distances.

"For the six weeks after the middle of July, when the weather conditions are best for flying in the Polar regions, the large plane as well as the small planes will be put into service and the important work of the expedition will be done.

"Results of inestimable value to the United States and to science will surely be obtained from this expedition. There is no doubt whatever that this expedition can explore, survey and photograph the unexplored parts of the Arctic regions and establish the existence or non-existence of land or lands in that region.

"I feel sure that with Admiral Peary as Chairman of a Committee to co-operate with Capt. Bartlett, this expedition will be the greatest and most useful expedition ever sent to the Arctic regions.

"This expedition besides actually exploring the Polar regions will also explore the upper air and the bottom of the Polar Basin.

"The North Pole has been discovered. A number of hardy explorers have made certain discoveries and established certain scientific facts, but the major part of the work still remains to be done. Both Admiral Peary and Capt. Bartlett

want, I believe, to do a great deal of scientific research in the Polar Basin, of which over 1,000,000 square miles remain unexplored, and they would want to have a laboratory or part of the ship where the flora and fauna from the ocean bottom will be kept until the return of the expedition. Little or no data has been obtained from the bottom of the Polar Basin; no meteorological surveys have been made in the Polar region."

Mr. Henry Woodnouse, a member of the Board of Governors of the Club, who has made an extensive study of the subject of exploration by aeroplane, and who co-operated in organizing the Steffanson Relief Expedition in 1914, and with Admiral Peary, Capt. Bartlett and Capt. Amundsen in preparing to organize the Arctic expeditions of 1916, which were prevented by America's entry in the War, said:

"The plan was first proposed by Admiral Peary over two years ago, as a plan to be carried out by Capt. Bartlett, and the Club has fostered the development of the idea.

"This is a stupendous conception and is to start the use of aeroplanes for the important work of exploration, which, on the face of what the war has taught us, is most necessary. Exploration today is necessary to take stock of the world's natural resources, so that we may know exactly what the natural resources of the human race are. From a national standpoint it is absolutely necessary to explore and map all the land, island possessions and waterways under the control of the United States.

"I recall vividly the tragedy created by our lack of a supply of mica for use in gas masks upon our entry in the war. When some British ships which were carrying mica to the United States were sunk, we faced the tragedy of not having the material with which to make gas masks to save the lives of tens of thousands of American boys. At that time, when we all felt so helpless, I happened to talk to Admiral Peary about the matter, and he told me mica was plentiful in the sub-Arctic regions. Also that other minerals which were in great demand were to be found in the sub-Arctic regions.

"But it was too late, as it would have required months to prepare an expedition, and then it would have taken more months to find out exactly where the mica was to be found.

"The aeroplane makes all exploration easy, and its employment will permit exploring and mapping the unexplored part of the world in a few years, whereas by following the old methods it would take over 200 years.

"One of the fundamental factors necessary for the advance of civilization is the knowledge of the earth, the world which is the Human Race's inhabiting place, and its natural resources.

"There is a physical as well as a spiritual side of civilization, and the physical aspect which greatly influences the spiritual aspect is advanced by scientific progress. Philosophies not based upon a scientific foundation have not stood, and will never stand, the test of time.

"Considering civilization from its physical aspect, we can truly say that the world will never be civilized until we know all there is to be known about this earth of ours, which is the inhabiting place of the Human Race, until we know what it is and what its resources are. This means that considerable exploration and a tremendous lot of mapping will have to be done, and whereas aircraft greatly simplifies exploration and mapping, we find here another important service which the aircraft can render to science and humanity.

Only One-Seventh of Earth's Surface Accurately Mapped

"According to Edward A. Reeves, Map Curator of the Royal Geographical Society, England, only one-seventh of the earth's surface has been accurately mapped, and two-thirds have been mapped only from rough sketches, and the remainder has not been surveyed at all.

"Our present knowledge of the earth, its form, size, the configuration of its surface features, their measurements and representations on maps as we see them today is, according to Mr. Reeves, the result of many centuries of strenuous endeavor and conquest over obstacles, yet, at the present time, only one-seventh of the earth's land surface has thus far been accurately mapped, and it would take at least two hundred years to complete the task—with the usual methods.

Aircraft Will Make It Possible to Do in Twenty Years What Would Require Two Hundred Years with Usual Methods

"The aircraft will make it possible to do in twenty years what would require two hundred years with the usual methods. Progress in exploration and mapping has been slow. Looking back in history, we find, at the end of centuries of work in this line the conditions set forth by Mr. Reeves.

"The extent of geographic knowledge at the time of Homer, about seven centuries B. C., was limited to a few miles and the prevelant idea was that the earth was a flat surface surrounded by an endless ocean, with all kinds of awful beasts barring the progress of travelers. The entire world, as far as they knew, consisted of Greece, Rome, the western coasts of Asia Minor, Egypt, and coastal lands along the Mediterranean Sea, the Red Sea; but they had no actual geographic knowledge.

"Two thousand years later, before Columbus sailed from Spain for that eventful trip which resulted in the discovery of America, geographic knowledge was still very limited. The world, as known then, consisted of the land between the Atlantic and Arabian Seas, and from the African coastal lands on the Mediterranean and Red Seas, to not further than Moscow on the other side, about 5,000 square miles in all. The maps of the time show that geographers believed the American continent to be China and India.

"Today our geographic knowledge is extensive, but not complete. The total area of the land surface of the earth, together with the unknown parts of the Arctic and Antarctic regions, which may be either land or water, is about 60,000,000 square miles. Of this only about 9,000,000 square miles have been scientifically mapped. This is roughly one-seventh. Of the remainder, about 6,000,000 miles have been mapped from less reliable surveys, chiefly non-topographical, about 38,000,000 miles have been mapped only from route traverses and sketches, and 8,000,000 are entirely unsurveyed and unmapped.

"At the pace aeronautics is developing we may expect that within twenty years aircraft will be plying across the oceans and deserts and landing cargoes of goods and passengers in what are now the most inaccessible places."

Capt. Bartlett was captain of the "Roosevelt" on both of the Peary Expeditions in which he reached the 88th parallel. While captain of the G. G. S. "Karluk" in January 1914, the ship having been crushed by the ice, he led the 17 members of the Expedition to Wrangle Island, then crossed over to Siberia with one eskimo and returned with a relief party.

Capt. Bartlett was also commander of the MacMillan Relief Expedition, and last Winter was commended by Secretary Daniels for his extraordinary achievement in taking the ship "Favorite" out of the ice from Quebec.

NAVAL AVIATION

SECRETARY DANIELS' annual report contains numerous reports and references to naval aviation. While, as Admiral Sims pointed out, the supply of naval aircraft was short of meeting the need, Secretary Daniels' report shows that American naval aviators have a most remarkable account of themselves.

In his report the Secretary asked for $225,000,000 for naval aviation for the year beginning June 30, 1919, but, it will be recalled, these estimates have since been cut down to a very small sum, which does not even seem large enough to keep the Naval Aircraft Factory in full operation and meet some of the financial obligations already incurred.

We print herewith references to Naval Aviation which occur in the 380 printed pages of Secretary Daniels' report:

The Navy That Flies

Of gratifying proportions and effectiveness have been the expansion of aviation in the Navy.

On July 1, 1917, naval aviation was still in its infancy. At that time there were only 45 naval aviators. There were officers of the Navy, Marine Corps, and Coast Guard who had been given special training in and were attached to aviation. There were approximately 200 student officers under training and about 1,250 enlisted men attached to the Aviation Service. These enlisted men were assigned to the three naval-air stations in this country which were then in commission. Pensacola, Fla., had about 1,000 men; Bay Shore, Long Island, N. Y., which was put into operation at that time, had about 100 men; and Squantum, Mass., which was abandoned in the fall of 1917, had about 150 men.

On July 1, 1918, there were 823 naval aviators, approximately 2,052 student officers, and 400 ground officers attached to naval aviation. In addition, there were over 7,300 trained mechanics and over 5,400 mechanics in training. The total enlisted and commissioned personnel at this time was about 30,000.

Of untold importance during the year was the establishment and placement under operation of naval-air stations at all the strategic and important points on the coast of the United States. Likewise, a station was established in the Canal Zone. As a result of those activities, the larger part of the American coast has been constantly patrolled by naval aircraft. Furthermore, the Navy Department has already planned and is fully prepared to establish enough additional stations to so complete the system that every foot of the coast of the United States can be thoroughly and constantly patrolled. Many of the stations now in operation are equipped not only with seaplanes, but also with dirigibles and kite balloons. The extent of activities that are being carried on can be readily illustrated. Thus, during June, 1918, a total of 25,642 flights, covering about 2,155,860 miles, were made by seaplanes at stations along the United States Coast. These figures include both patrol and training. During that same period of time lighter-than-air craft made a total of 613 flights, covering about 56,420 miles.

THE NEWS OF THE WEEK

Relics of Lufbery to Go to Home Town

Wallingford, Conn.—Edward H. Lufbery, father of Major Raoul Lufbery, the American ace killed in the war, presented to the Historical Society of Wallingford the war medal and diploma of the Aero Club of America that had been conferred upon his son.

The Aero Club was represented at the presentation in the Town Hall by its President, Alan R. Hawley, who said: "The Wallingford boy's heroic valor in the service of our country will always remain one of the brightest memories in American history."

The medal and diploma were accepted for the town by Selectman Hall, and will be permanently displayed in the Public Library. Governor Holcomb was a speaker. Former Lieutenant Governor Lake described Major Lufbery's death duel in the air, which Mr. Lake saw. Captain Bachelier, Military Attache of the French High Commission, was a guest.

Aeronautics Course at Brooklyn Polytechnic

A new course in the Theory of Aeronautical Engineering is to be given in the Evening Department of the Polytechnic Institute of Brooklyn, starting shortly after January 1. The class is open to college graduates and to others having adequate preparation which will correspond with that given by the first two years' work of a good technical college.

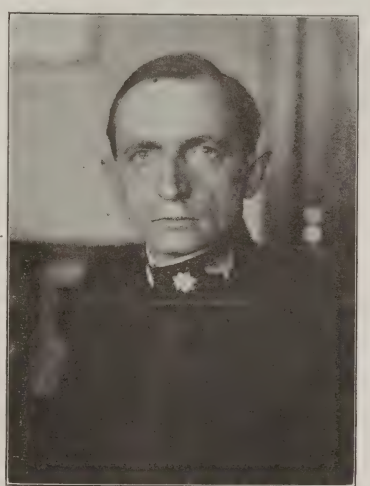
Two other new evening courses will be started about the same time: Marine Engineering, with about the same prerequisites as the course in Theory of Aeronautical Engineering, and Tool Drafting and Design, open to men having a good knowledge of mechanical drawing and modern machine shop practice.

Binoculars Being Returned

Return of binoculars, telescopes, spyglasses, sextants, chronometers and other navigation instruments loaned to the Navy soon after America's entrance into the war, in response to an appeal by Assistant Secretary Roosevelt to the public to supply "eyes to the Navy," has been ordered. Over 100,000 of these articles were sent out in response to the request.

Each article will be returned as soon as practicable, and owners are requested to refrain from unnecessary communications to the department, as this will tend to delay rather than expedite return and distribution. Considerable delay is to be expected in many cases, as these instruments have been in use in various parts of the world at ships and stations, and it is probable that it will be more than a year before the last of them reach this shore. Permanent changes of address of owners should be communicated to the Naval Observatory, Washington, D. C.

Transfers in Department of Military Aeronautics



Colonel Arthur Woods has been appointed Assistant Director of Military Aeronautics. Colonel Woods, who was Chief of the Personnel Section, Division of Military Aeronautics, is the immediate successor of Colonel Gerald C. Brant. The appointment of Colonel Brant, however, was only temporary, and therefore, according to the records of the division, Colonel Woods is officially the successor of Colonel Henry H. Arnold.

Colonel Brant has been appointed chairman of a board to work out and recommend plans for the permanent organization of the air forces.

Colonel Woods has been succeeded as Chief of the Personnel Section by Lieutenant Colonel Rush B. Lincoln, formerly Executive Officer of that section.

Direct Airmen By Radio Phone

A ship formation of three planes directed by a fourth, by means of the new radio telephone was staged at Bolling Field for the benefit of government officials.

Commander Coburn, in charge of the Naval Aircraft Factory at Philadelphia

This is the second exhibition of the new air wireless telephone that has been given in Washington. The first was demonstrated before President Wilson on the White House lawn two weeks ago.

Army Airmen to Be Instructed Yearly

Washington.—Army aviators who go on the inactive list of the reserve corps after demobilization are to be given an opportunity to keep in practice by flying military planes, so that they may be in touch with the development of new fighting aircraft and ready for active service on short notice.

A War Department announcement December 4th outlines a plan contemplating that reserve aviators will be called to active service at army flying fields for two weeks each year for experience with up-to-date planes. It is realized, the statement says, that it cannot be possible for any proportion of the men to buy aeroplanes of their own, or that anything approaching delivery of service planes is to be foreseen in the near future.

Albany to Have Municipal Aerodrome

The city of Albany, one of the hundred or so cities cooperating with the Aero Club of America and the Aerial League of America, is to have a municipal aerodrome.

The bubble of skepticism which has for years clouded the establishment of an efficient and speedy mail and passenger transportation system by air was burst on December 18 by the energetic Major Cushman A. Rice and Captain Stanley Stanger, British ace who went to Albany, representing the Aero Club and Aerial League.

These men addressed the newly organized Members' Council of the Chamber of Commerce at the initial meeting in the Ten Eyck Hotel and drove home convincingly the benefits and feasibility of Albany as a pioneer centre of air activity. If Albany were to establish, as is planned, a municipally owned aerodrome and landing field, the city would be the first in the United States to take this leading step.

Major Rice, who had charge of 20 American aero squadrons sent overseas last winter, outlined the startling future of aircraft in America and in Albany. Some of his points touching on the development of the air, which were received most enthusiastically be the members, were these:

"If you men take this as a business proposition, as I am confident everyone will, I assure you there will not be an ounce of first-class mail carried by other means than aeroplane inside of three years."

"Albany has several favorable sites for an aerodrome, which may be fitted properly in a short time and at minimum cost to make the city an intermediate point in air routes with a surprising volume of air traffic benefitting the city."

"There are now in operation several efficient system of mail traffic between principal cities, and the expansion and development of the air as a mail and passenger transportation medium is coming surely and speedily."

"Thousands of aeroplanes in use overseas and now under construction, owned by the United States government, should be utilized for this service with the double asset of minimum cost and employment for thousands of returning aviators."

Col. Thaw In from France

Lieut. Col. William Thaw, known as "the American Eagle" in the days of the Lafayette Escadrille, arrived at the home of his mother, Mrs. Benjamin Thaw, 640 Park Avenue, last week. Colonel Thaw and a half-dozen other officers reached Newport News, Va., Dec. 21 on the steamship Martha Washington.

The Curtiss "N-C-1" flying boat, equipped with 3 Liberty engines, which recently made a flight with 50 passengers

American labor leaders who visited the Caproni factory: Messrs. John Spargo, Charles E. Russell and Samuel Gompers—are shown herewith with Mr. Caproni

Colonel Thaw, who comes back with the decoration of a Chevalier of the Legion of Honor and any number of citations for courageous exploits, was well known in America as an amateur aviator long before he joined the French Army two weeks after the war began. He was in Paris when hostilities began, flying in a hydroaeroplane, and he enlisted in the Foreign Legion for field service and later was transferred to the aviation section. Previous to going abroad, Colonel Thaw's most notable air exploit was a trip in a flying boat from Newport to New York in 1913, during which he made the first flight under the four bridges spanning the East River. While serving in the escadrille, Colonel Thaw's name was as frequent in dispatches telling of the downing of German aeroplanes as that of the famous Major Lufbery.

A year ago the War Department announced that Colonel, then Lieutenant Thaw, had been taken into the American Air Service, with the other members of the escadrille. He was commissioned a Major and assigned to duty with the 103d Aero Squadron. Up to the time he was promoted to a Lieutenant-Colonelcy last month he had been officially credited with bringing down seven opponents, this number of victories, of course, not including his record prior to entry into American service.

Dirigible Makes Record

Key West, Fla.—A new world's record endurance flight in a non-rigid dirigible balloon—thirty-two hours of continuous flight—was established November 23 by Ensign Thomas E. Maytham of Buffalo at the United States Naval Air Station at Key West, Fla.

The usual full load of radio outfit, supplies, etc., was carried. Six hundred miles were covered before a leak and a threatening storm compelled landing.

Air Battle Staged for Motion Pictures

With the American Aerial Forces in France.—An air battle between a big German biplane and a little French Spad with Lieutenant Edward V. Rickenbacker, an American ace, in the French machine, was staged over an American aerodrome the other day for the benefit of an army photographer. The German machine was a big Hannover, which had landed within the American lines because of motor troubles. The motion pictures were made by Captain Edwin H. Cooper in the observer's seat of an American Liberty machine. Lieutenant Thorne C. Taylor, of Chicago, was in the pilot's seat of the Hannover machine.

At first Rickenbacker's Spad and the German biplane were warily circling around while the Liberty machine encircled both with Captain Captain Cooper grinding the crank of his motion-picture camera. During the manoeuvre Rickenbacker's machine gun was rattling merrily while the guns of the German machine also were working vigorously.

The machines had worked up to a considerable height and attracted the attention of aviators in nearby aerodromes who were not in the secret, and who were amazed to see a lone German biplane circling over an American pursuing group in broad daylight. Four machines from these other camps came over to see what it was all about, ready to put the finishing touch to the German if their help was needed. By signaling they were warned that it was all a game, and they sailed away again. Suddenly the German machine swerved, and the figure of a man came hurling to the ground. A groan went up from the lips of one of the mechanics who had been delegated to fetch the dummy figure, for it had struck the ground nearly a mile from the field. This ended the "fight."

Aviator in Fox Hunt

Lieutenant Thomas Hitchcock of the French Escadrille, whose escape from a German prison camp furnished one of the most interesting tales of the war, recently forgot his terrifying experiences as a French aviator when he took part in the fox hunt of the Meadow Brook Hunt Club. Seventy members of the organization went out with the hounds in a hunt over the north country in the vicinity of East Norwich, Syosset, and Jericho.

The trail led over a distance of about twenty-five miles with a number of unusually large jumps marking the journey. Six coverts were drawn and several fresh trails were found, but because of the velocity of the wind the pack was unable to hold the scent for any great length of time.

Lieutenant Hitchcok is an ardent hunter. He is following the hounds regularly now as part of a course of training which he calculates will restore him to perfect condition for air service again.

Urges Naval Air Patrol System

If the United States had possessed coastal air defense stations when it entered the war such as the Navy now proposes to establish German submarines, which operated along the Atlantic coast, "would have done much less harm than they did."

This is the opinion expressed by Captain G. W. Steele, acting director of naval aviation, in a statement to the House Naval Affairs Committee on December 17, in which he strongly urged the creation of a naval air patrol system, embracing both heavier-than-air and lighter-than-air machines, on both the Atlantic and Pacific coasts.

Dirigibles of the lighter-than-air type, similar to the Zeppelin, are favored by Captain Steele.

Numerous instances of combats between air and underseas craft were described by him, which were filed with the committee, having been secured from the official archives of the British navy.

This has been advocated for several years by the Aero Club of America and repeatedly driven home by arguments and addresses delivered all over the country by Rear Admiral Robert E. Peary, U.S.N., retired, president of the Aerial League of America.

The Curtiss Model "K" Triplane, with a Curtiss engine

The AIRCRAFT TRADE REVIEW

S. A. E. Members Visit Standard Plant

On Monday, December 16, 1918, about 60 members of the Society of Automotive Engineers visited and inspected the plant of the Standard Aircraft Corporation, Elizabeth, New Jersey.

Previous to going through the big aeroplane factory the members of the society were the guests of the Standard Aircraft Corporation at a luncheon.

The program of the day follows:

10:57 A. M.—Arrive at Elizabeth Station, Pennsylvania Railroad.

11:10 A. M.—Take special busses and arrive at plant of Standard Aircraft Corporation, using entrance to visitors on side street.

11:15 to 11:30 A. M.—Issuing passes and registration.

11:30 A. M. to 1:15 P. M.—Plant inspection: HS2L Boat, Wing Assembling, Handley-Page Warehouse and Receiving Department, Metal Shop and Brazing Department.

1:30 P. M.—Luncheon in Office Dining Room.

2:30 to 3:30 P. M.—Plant inspection: No. 5 Building to No. 4 to No. 3 to No. 2 to No. 1 to Handley-Page Assembly.

3:30 P. M.—Motor Testing Building.

3:40 P. M.—Club House, Auditorium, Moving Pictures and addresses.

4:40 P. M.—Leave for trains to New York. Time, 4:49, 5:05, 5:09, 5:17, 5:55.

The following members of the Society of Automotive Engineers were present:

S. P. Thacher, S. C. McKeoun, Joseph Schaiffers, George M. Cohen, H. W. Topley, Charles E. Davis, James R. McCallum, Elmer S. Crocker, E. Tarvay, H. C. McBriair, Carl F. Scott, F. G. Diffin, Charles Aroesch, J. Breitenbach, C. A. Chapman, Robert Miller, J. W. B. Pearce, Chas. J. Faber, J. R. Straus, W. K. Hadley, C. H. Crittenden, R. C. McAlpin, G. Edgar Allen, Edward J. Fornlinson, Gilbert L. Dannehurd, W. C. Davis, H. W. Merritt, Theodore Douglas, E. W. Holmes, O. Froelich, O. Blomgren, M. C. Dorine, B. Nikifokoff, Louis W. Williams, C. R. Bissell, Leo Weiner, C. B. Hayward, E. Lindberg, William F. Ryerson, Frederick J. Schmidt, Lieutenant A. F. Wagner, P. M. Erikson, Henry S. Sherman, J. J. Murray, Robert H. Schickel, Arthur Mayer, W. More, L. Ruprecht, F. A. Thompson, A. M. Wolf, G. B. Ingersoll, J. R. Kelso, R. H. Sleicher, J. T. Pratt, First Lieutenant A.S.A.P.; J. B. Sessions, Joseph L. Moss, Jr., A. Gibbons, Henry C. Steinman and Sidney Oxberry.

Wadman Opens Office

Rex W. Wadman, who has been doing special work for the Ordnance Department, U. S. A., has re-established his New York office at 16 Beaver Street.

After American Agencies

Washington.—The Bureau of Foreign and Domestic Commerce, Department of Commerce, has requests from Columbia for the agency for aeroplanes, automobiles and trucks. Further information can be secured by addressing the Department of Commerce, referring to Foreign Trade Opportunity No. 27743. The Department also has an inquiry from Peru, desiring an agency on a commission basis for the sale of farm tractors, automobiles, accessories and oils. Further information can be secured from the Bureau of Foreign and Domestic Commerce by referring to Foreign Trade Opportunity No. 27748.

Liberty Motor Production

Washington.—The actual output of Liberty motors in October was 3,878, according to an announcement authorized by the War Department. This is an increase of 1,500 over September. The Air Service expected 2,500 motors in September and deliveries were short 122. The quota for October called for 3,000.

The factories producing the motors are expected to turn out a minimum of 4,350 during November. With the big plants now in full operation, it is expected that the November figures will be far ahead of the number called for.

Wins Liberty Motor Flag

Indianapolis.—The Nordyke & Marmon Company of this city won the first honor pennant offered by the United States Government to the concern building and shipping 12-cylinder Liberty motors the most rapidly in October, it was announced. The contest began October 1, and ended last midnight. The company made a production record of 225 per cent of its allotted quota in October. The contests are to be continued each month. Five other firms contested during October.

Statement by Henry Ford

In answer to the criticism of Charles E. Hughes that the Ford Motor Company employed some enemy aliens, Henry Ford made the following statement:

"The Ford Motor Company has manufactured 1,242 Liberty motors during the last month. That was about 300 more than were manufactured by the next highest factory. I do not know what better answer could be made to all the criticisms.

"We started later than others and have passed all, the production standing up to the most rigid inspection in every particular.

"Our policy is to make men, not to break them. In times of panic great injury and injustice are often done to innocent persons, and we try to keep our heads.

"We would not allow injustice to be done to an old, trusted and valued employe even though he was born in Germany. The results speak for themselves. Mr. Embe, referred to as the special example in the Hughes report, has been with us a little over twelve years, and he is a most able and excellent engineer and has always given perfect satisfaction. Not one word of fault could be found by Mr. Hughes or any one else with regard to Mr. Embe's actual work.

"We in the plant know that he gave valuable assistance and many suggestions with regard to the development of the Liberty motor cylinders, which are being furnished to all the manufacturers, with a saving of $345,000 a month to the Government over former prices.

"From the very beginning of the war we have taken the greatest precaution against sabotage or other hostile work of aliens, and at the same time have endeavored to follow the instructions of the United States Government as stated to us by the United States Marshal. We have had no interference with our work that could in any way be traced to enemy aliens. We organized an investigating department, with the utmost care, to examine into the record of every alien enemy and his work, and we have been commended most highly by the Government officials for that work. The United States Marshal can speak for himself as to our organization and work with regard to that."

"The Ford Motor Company did not employ a single German alien without the permit of the Marshal's office. There were 801 applications in all out of 40,000. When the names were brought to us we found that they had already been thoroughly investigated by the Ford investigators," said United States Marshal Henry Behrendt. "We found in our work that the Ford investigating system is the most thorough of any, and I have often referred to it as a model for others to follow.

"We have had less trouble with enemy aliens in the Ford plant than in any other large plant. If there is any blame with regard to the Ford plant, it should be on the Marshal's office, and not on the Ford people. We only found two men against whom a suspicion arose afterward, and they were taken care of. In our investigation we found that many of the 800 had sons and brothers in Europe fighting for America."

Aero Mail Terminus Removed to Belmont

Coincident with the announcement that the eastern terminus of the aero mail service had been transferred back from the Standard Aircraft Corporation's field at Elizabeth, N. J., to its original site, the Belmont Park, L. I., field, officials of both military and mail air services cited occurrences of the past week to show that, through flying by compass, American aviators have succeeded in overcoming the impediment of fog and cloud banks, which had been one of the reasons for moving previously to the New Jersey field.

Two flights by compass were told which aroused the pride of American aeronauts in the ability of their colleagues to traverse the airways without the aid of visible landmarks. Captain W. P. Jacobs, with Colonel L. W. MacIntosh for a passenger, flew from Buffalo to Mineola, a distance of 407 miles, in an army De Haviland "9," equipped with a Liberty motor.

Flying above the clouds, Captain Jacobs depended entirely upon "navigating instruments," and managed to keep well on his course, coming by way of Binghamton in order to avoid the mountain passage by following the Delaware Valley. He made the trip in three and one-half hours, averaging 120 miles an hour. He left Buffalo at 10:20 and landed at Mineola at 1:50 P. M.

Officials at Hazelhurst Field also told of a flight made successfully from the Mineola army station on Sunday, when the fog hung like a pall over all this part of the country and was so dense that great ships, such as the Leviathan, were unable to enter New York Harbor. A military aviator carrying departmental papers for Washington left the Hazelhurst field and flew to the capital in two hours and fifty minutes.

The time in clear weather has ranged from ten minutes to two hours longer, it was said, and the present aviator was handicapped by being compelled to make two landings because of the heavy rain he encountered along the way.

Record Aero Mail Flight

Ira Biffle piloted the New York-Washington mail aeroplane to the National Capital Dec. 16 in one hour and thirty minutes' flying time. Ten minutes were consumed in transferring the mail at Philadelphia, making the time from field to field—New York to Washington—one hour and forty minutes.

Chicago-New York Aero Mail

On December 18th, fifteen years and a day after the Wright Brothers made their flight at Kitty Hawk, N. C., the first regular aero mail route between New York and Chicago was inaugurated at 6 A. M. from Belmont Park, Pilot L. D. Smith started at 6:30 A. M. in a DeHaviland-4, driven by a Liberty Motor, for the first leg of the journey to Lehighton, Pa. Owing to engine trouble he had to land at State College, Pa. His ten sacks of mail were to be transferred to another plane which was to leave Bellefonte for Cleveland at 10:45. This, however, could not be done, and the mail was sent out by train. Smith was several hours behind schedule when he landed at State College. At Cleveland they were to be changed again for the last lap to Chicago. His aeroplane carried 266 pounds of first-class mail, which was due to reach Chicago at four o'clock in the afternoon. The hope was to cut the eighteen hours required by train to negotiate the 832 miles to Chicago down to nine hours by aero mail.

Pilot A. E. Johnson waited, and as Smith did not arrive on schedule time, Johnson left at nine o'clock A. M., without any mail, for Cleveland. He landed ten miles east of Woodland Park, mail plane field at Cleveland, because he was unable to locate the station, and his machine remained there over night. Searchlights were kept on the Woodland Hills, Park Field, till a late hour, as postal authorities thought that an attempt might be made by Johnson to fly into Cleveland.

Lyman W. Doty, flying a reserve plane, landed and turned turtle near Painesville, Ohio, during the day. The only damage sustained was a broken propeller.

The delay at the Chicago end was caused by the inability of the planes to reach that city from Defiance, Ohio. It was expected that a start would be made from Grant Park, Chicago, at 10 A. M. Local officials who gathered at the park were informed that one of the machines which left Cleveland to fly to Chicago had met with an accident at Defiance.

As the two machines attempted to land, one was partially wrecked by impact with a fence. A propeller was broken and the plane otherwise damaged. The accident was caused when a woman spectator, with a baby in her arms, emerged from the crowd, and the aviator steered his plane into the fence to avoid striking them.

The other plane, piloted by "Mike" Ebersole, landed successfully and later continued on to Chicago, reaching there in the afternoon. He took aboard a cargo of mail for New York at 4:07 P. M., and flew to Ashburn flying field, in the outskirts of the city, where he spent the night preparatory to the eastward flight this morning.

Chicago officials said that probably several days will elapse before the service will be running regularly on schedule time.

On December 17th, Lieutenant D. I. Lamb, an aerial mail carrier, crashed his aeroplane into a tree near Selinsgrove late today, uprooting the tree and damaging the machine. He escaped uninjured.

Lieutenant Lamb was en route to Bellefonte from New York, where he was to take up a lap to-morrow of the New York-Chicago mail route.

Second Day, Chicago-New York Aero Mail

On December 19th Aviator Taylor left Belmont Park at 7:10 in the morning, flying a DeHaviland-4 on the first leg of the journey to Chicago. Thirty minutes later Aviator Fry followed Taylor to pick up the mail if Taylor should meet with an accident. The first section of the route ends at Bellefonte, Pa., where two other fliers were to await the arrival of Taylor and carry the mail to Cleveland, where the last section starts. Both Taylor and Fry got away without mishap. The weather was excellent, and it was expected good time would be made if no accidents interfered. As AERIAL AGE goes to press, we have not heard whether he landed safely.

Taylor carried two sacks of mail. One, weighing eight and a half pounds, was for Chicago. The Cleveland pouch contained five pounds. Fry flew a Curtiss plane with a Liberty motor.

Word was received at Belmont Park that no mail plane started from Chicago. All available machines there had developed trouble and could not be repaired in time to get away for Cleveland.

Post Office men are not discouraged by the failure to complete a trip yesterday. They are confident that they will quickly have the service in good working order and are confident that they can overcome all difficulties.

Carrying the aerial mail from Philadelphia and Washington, Pilot L. V. Smith started from Belmont Park at 12:12 P. M. He carried six sacks containing 157 pounds of mail.

Left to right: Miss Wanda Orynski, Miss Helen F. Armstrong, Miss Marie Thomas and Miss Marjorie Spuslock, attached to the Aerial Mail Service

MILITARY AEROSTATICS

By LIEUT. H. K. BLACK, R. F. C., C. F. A.

WHEN a free balloon leaves the ground it is very necessary that sufficient lift is obtained to ensure the steady ascent of the balloon. There have been many good ballonists fooled by a false lift. While weighing off the balloon may be caught by a stray gust of air which will give the impression that a lift has been obtained. When a balloon has been let go, however, if it was a false lift it will probably sink rapidly to the ground, and if there happens to be a wind at the time the landing will be more exciting than comfortable. I remember one occasion when something like this occurred. A pilot was taking three cadets up for their first flight. There was about thirty-five miles of wind on the ground. The pilot, old hand at the game as he was, was mistaken in his lift. The balloon rose from its shelter till the wind struck it. Then it descended forcibly upon the roof of a nigger "Shack," much to the discomfiture of the inmates. The pilot was spilled out by the impact onto the room. As the balloon struck he shouted to throw out a bag of sand. The cadets were determined not to lose the pilot, as he was their only hope in the balloon. None of them knew anything about one. They hauled him back into the basket. The loss of his weight, however, had lightened the bag, giving it a good lift. Then as it started up they each threw out a bag of sand. There was no doubt about the lift they had then. The basket was swinging and their ascent was made in a series of zigzags, if one may use that expression regarding a balloon. So the false lift is a thing to be avoided. As the appendix is open when the ascent is made—and, by the way, be sure to see that it is open—there is no danger of a free balloon bursting. The escaping gas reaches the open air through the appendix.

When the balloon has reached a sufficient height the drag rope may be released. There are several methods of coiling a drag rope. The best method is probably that adopted by the French. In this way it is coiled in a sort of figure eight arrangement. It is tied about the middle with some strong twine in such a way that it cannot interfere with the uncoiling. The whole thing is then tied to the edge of the basket. The twine which holds the drag rope must be cut when the required altitude is reached. If the rope has been coiled correctly it will uncoil rapidly, smoothly, and with not the slightest jar to the basket. There is a knack in coiling the rope which I know has not been learned in some of the training schools in this country.

A free balloon is about the quietest thing I know of. As one is drifting with the wind at the same speed there is no wind blowing past one's ears, and, as there is nothing to move there is no other noise. When the balloon is either rising or falling very slowly there is no sensation either of going up or down. A statoscope is an instrument designed to give one that information. It is extremely sensitive. If, however, no statoscope is available, a home-made device will answer the same purpose. If small pieces of tissue paper are thrown out of the basket they will remain almost stationary in the air and from the direction they apparently take one can tell whether the balloon is ascending or descending.

When the balloon has reached the desired altitude the pilot must endeavor to keep it there without the expenditure of more ballast or gas than is absolutely necessary. If it is desired to fly at five thousand feet and the balloon goes higher than that it is best to check its ascent by valving a little at a time. The chances are that when it stops going up it will come down somewhat. The contrary is also true. If a balloon is coming down, the expenditure of enough ballast to check the descent will probably send it up again somewhat. Ballast and gas are two precious things, and they should be husbanded as much as possible, for on the supply of both depends the length of the trip. So many things affect the altitude of a balloon, such as upward currents of air, valleys, hills, woods, etc., that while the balloon may not remain at a constant height all the time, still the average height will remain fairly constant, and what one loses in height from one cause one will gain from another.

The landing of a balloon is probably the hardest part of ballooning. From the air the ground should be searched for a suitable landing place. The balloon should be brought down to a fairly low altitude for this, but one must be careful not to valve too much on the descent. A landing spot should be picked which can surely be reached, and when one has decided to make a landing there it should be made. A vacillating mind does not belong to a good balloonist. A fairly high amount of gas should be released as the balloon nears the landing place. More gas should be released than seems necessary, for as the drag rope touches the ground it releases weight from the balloon and thus eases up the descent. It also tends to slow up the balloon in a high wind if it drags through trees. The anchor, if one is carried, may be dropped overboard also when nearing the ground, and when that touches the ground it releases a lot of weight and sometimes necessitates even more valving.

When the anchor catches and brings the balloon to rest, it may be valved down to the ground, and the use of the rip cord is obviated. However, in lots of cases the anchor is not carried, and sometimes it does not hold up the balloon, so as a general rule it is better to use the rip cord. This should be done at not less than twenty feet. It is impossible to be arbitrary about this, but as a rule somewhere about twenty feet is about right. The rip cord should be pulled with a good sharp jerk and continued until the panel is fairly well out. The balloon should then settle to the ground without jar, and not move once it has touched. However, one thing which should be remembered on all occasions is that no one should get out of the basket until the balloon has fallen down. In cases where the flight is to be resumed, of course, the rip cord is not used. The balloon is valved to earth and ballast put in to take the place of those who get out of the basket. In this case it is more necessary than ever for no one to get out of the basket till their weight in ballast has been placed therein.

Accidents will happen surely if this is not remembered. When the balloon has fallen down, the remaining gas is released, the basket disconnected and the net removed and rolled. The valve should be removed, fastened and placed carefully inside the basket to one side and the concentrating ring to the other. The net is then packed in between them. The instruments should be carried personally. The envelope is folded and rolled and placed in its case. The drag rope is coiled and put in the basket. The anchor should never be put in the basket. It should be a separate piece of baggage.

After the balloon is packed someone should always remain with it; it should never be left alone.

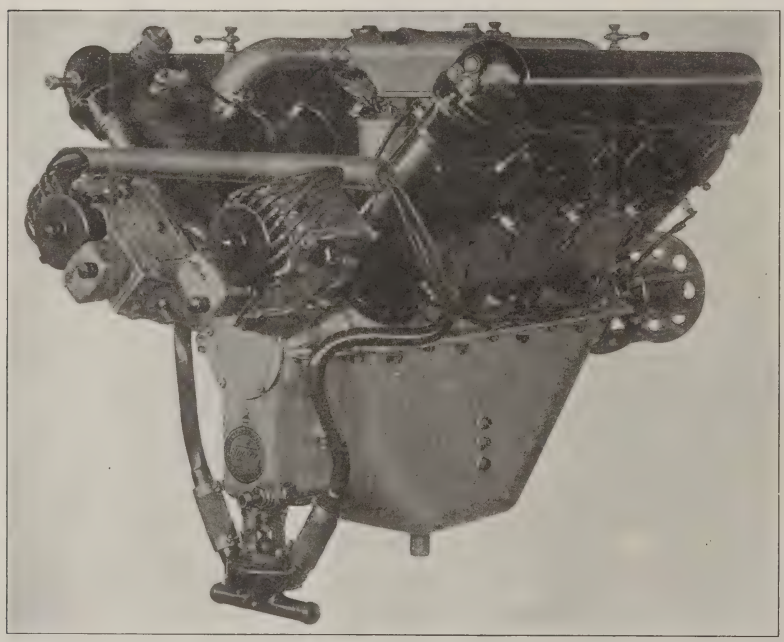
Free balloon ready for an ascension at Washington, D. C.

THE HISPANO-SUIZA ENGINE

THE Hispano-Suiza engine has been used in far larger quantities by the allied arms than any other motor and has been produced in much greater numbers than any other design of aeronautical engine.

It has been built in France, Spain, England and America, and is about to be made in Japan. Originated in Switzerland and Spain through the old Hispano-Suiza Motor Car Co. by Marc Birkight, the engineer and general manager of the company, it was quickly taken up by the French Government, being an engine which at that time was exceptionally light for its power and was also very easy to manufacture by comparison wtih the rotary motors and with the majority of the water-cooled fixed cylinder engines of French or British origin. For France it did so well in the air that a large number of French factories were ordered to drop their own experiments and devote all their energies to Hispano-Suiza manufacture. At the signing of the armistice there were seventeen plants in France wholly given over to Hispano work.

Meanwhile one of England's largest automobile plants had been taken over by the British Government to make a slightly modified copy of the French motor and the Wright-Martin Aircraft Co. of New Brunswick, N. J., had started to make an exact copy of the French engine, for France, before the U. S. entered the war.



While the French plants all manufactured to identical drawings, the British made some changes. The American company, while it was building to the French order, copied the French design so well that parts shipped as spares would fit the motors built in France just as well as those completely manufactured in America, but when work was begun on orders for the U. S. forces a number of changes were gradually introduced.

The most interesting American development by far has been that of the 300 h.p. engine. The original motor was of 150 h.p., and this was followed by the almost identical 180 h.p. which differed only in that it had a higher compression and ran at a higher speed. The Wright-Martin Co., the only American licensees, by the way, have built large quantities of the 150 h.p. model, most of which have been put in advanced training planes and used in the U. S. It also built a good number of 180 h.p. engines for S.E.5 planes which were being shipped to the front at the conclusion of hostilities. The 200 h.p. geared motor, used largely in France, was never manufactured in America.

In the Summer of 1917 Monsieur Birkight laid out a 300 h.p. motor similar to the original 150 h.p., but larger, and there was much discussion then as to whether the geared 200 h.p. should be abandoned in favor of the new design. At that time plane makers were not ready with fighting machines to utilize 300 h.p., so the design was side-tracked, only being taken up intensively in France towards the end of 1917. Between June and September, 1918, practically all the French plants were changed over to produce nothing but the 300 h.p. and had the war continued till next Spring, tens of thousands of this type would have been in use.

Model A Hispano-Suiza engine, identical with the original French 150 h.p. motor

Wright-Martin piston and connecting rod, Models E and I

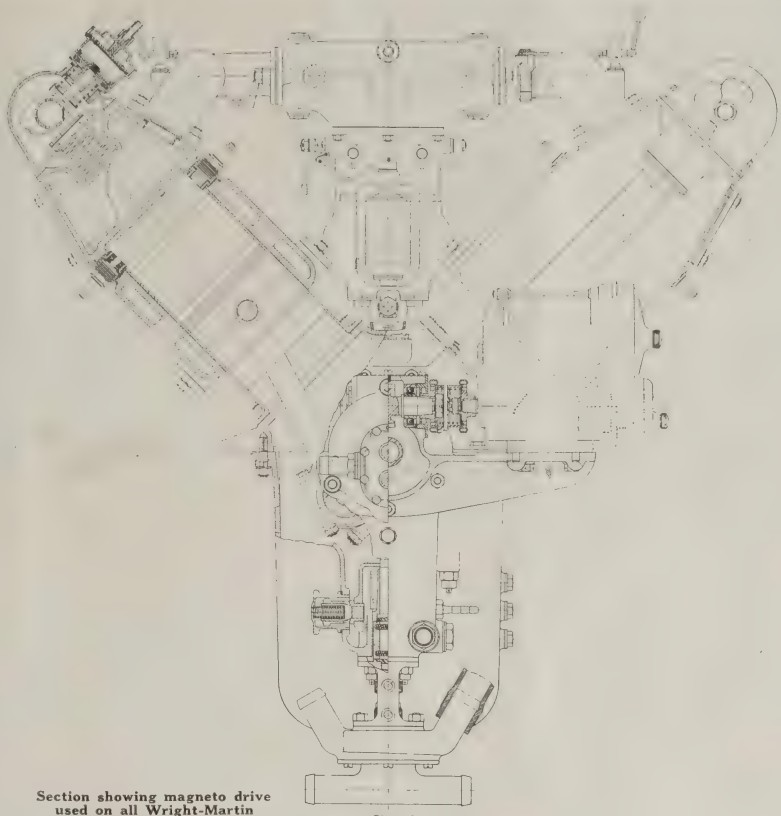
During the period from June, 1917, till the end of that year, Birkight went on with experimental work on the 300 h.p. and H. M. Crane, Vice-president of the Wright-Martin Aircraft Co., also proceeded with a design which, while it embodied most of the French features, yet differed in some very important points. When placed on test last Spring at the Bureau of Standards at Washington, and later at McCook Field, Ind., this Crane motor showed substantially more power than the French engine with the same bore and stroke and had a much lower oil consumption. It was also easier to manufacture in several details, and was stronger than the French engine, making for greater durability. The weight was slightly greater, but the power to weight ratio was slightly better in the American design.

In course of developing the 300 h.p. sundry small discoveries were made which led to alterations in the smaller motors then in production at New Brunswick, so that at present the 150 h.p. and the 180 h.p. American Hispano engines are quite distinct from the French motors of the same rated power and cylinder dimensions. The differences are, however, matters of detail and are not such as to prevent interchange of American and French engines in the same plane.

In all there are four types of

Wright-Martin Hispano motors. Model A is the original and is a copy of the French 150 h.p. precisely. Model I is the improved 150 h.p. which for some time past has been supplied for American training planes.

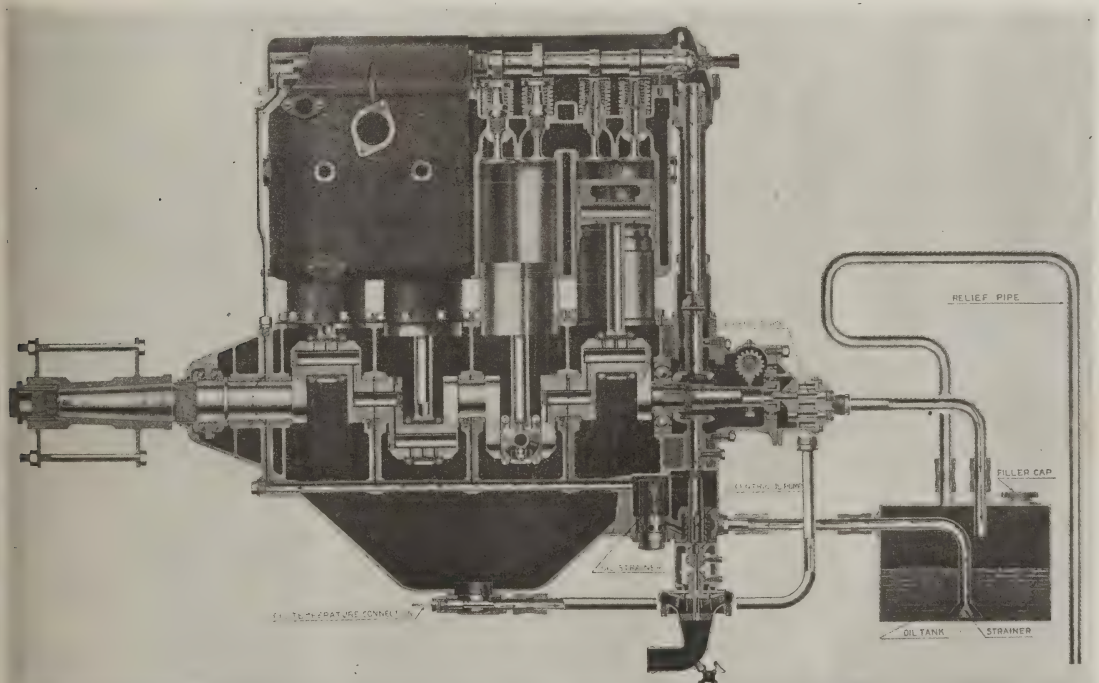
Next comes the 180 h.p. which is known as Model E and is identical with Model I except that the pistons are different, giving the higher compression. Finally there is the 300 h.p. or Model H.



All four engines are eight-cylinder V type with 90 degrees between the blocks and each of the three smaller ones have the same piston displacement, their bore being 120 mm. or 4.72" and stroke 130 mm. or 5.11". Model A and I develop 150 h.p. at 1450 r.p.m. Model E develops 185 h.p. at 1750 r.p.m.

The three smaller motors will be described first; in the following description all parts are common to all three models except where otherwise specified.

Unique Points in Design



There are two basic features peculiar to all Hispano-Suiza motors, the cylinder construction and the valve operation. The cylinders are separate steel sleeves flanged at the bottom for attachment to the crankcase and with flat steel heads in which the valve seatings are cut. These sleeves are threaded for almost their entire length and are screwed into an aluminum water jacket which carries the valves and the camshaft. The resulting effect of this construction is to provide an aluminum cylinder block completely lined with steel.

All stresses within the cylinders

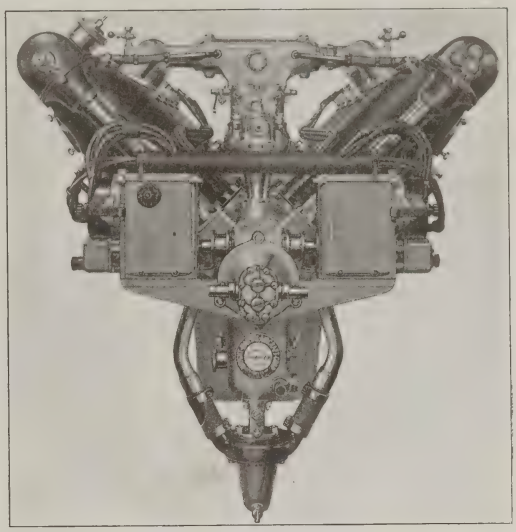
are transferred directly to the crankshaft and crankcase through the steel sleeves, the aluminum having only to carry the camshaft, and this means that the cylinder block is very strong while being very light in weight. The cylinder block is enameled inside and out, protecting the aluminum from corrosion due to impurities in cooling water or in the atmosphere.

The valve seatings are cut in the steel heads of the cylinder sleeves and the valve stems project vertically upwards through cast iron guides screwed into bosses in the aluminum. A flat tappet of mushroom form is attached directly to the upper end of each valve stem.



The valve location has already been described, but the detail of the tappet adjustment is one of the most ingenious features

Section of Model I 150 h.p. Wright-Martin design Hispano-Suiza. Note the additional oil pump on end of magneto shaft

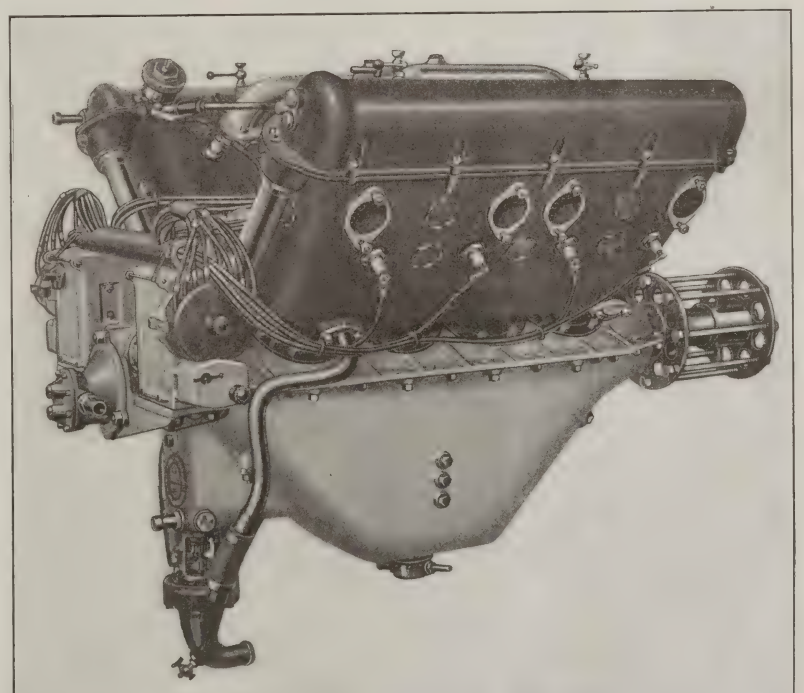
Left—Crane design connecting rod showing all component parts.

Right—Magneto arrangement on Model I and E Hispano-Suiza

of the motor. The valve stems are of large diameter and are hollow, being threaded internally. The tappet has a flat head with a notched edge and its underside is serrated, the top surface on which the cam bears being case-hardened. The stem of the tappet screws deeply into the hollow valve stem.

Beneath each tappet there is a washer with fine serrations which mesh with those on the underside of the tappet. The hole in the center of the washer is not circular, but there are two projecting pieces which fit in slots cut in the top end of the valve stem and around the periphery of this washer are a number of small holes. The valve springs, of which there are two to each valve, one inside the other, come immediately beneath the washer and hold it up against the tappet.

Now, owing to the washer fitting into the slots in the valve stem, it cannot turn on the valve, and if the washer is held the tappet can be turned, the serrations between the two "clicking" over each other and yet having grip enough to securely lock the tappet. A special wrench is used for this adjustment which can be performed with great ease and quickness.



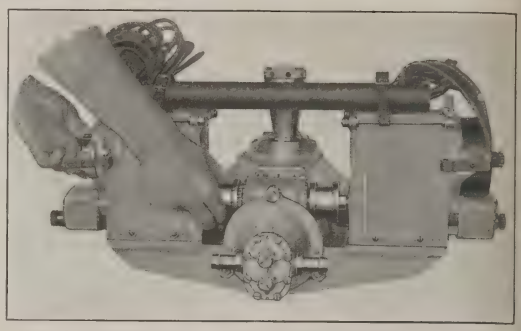
The camshaft is mounted in three bronze bearings bolted to the top of the cylinder block, so that the cams act directly upon the tappets without any intermediate mechanism. Camshaft and valves are inclosed by an aluminum cover and operate in a perfectly lubricated condition.

At the end of the cylinder block there is a vertical shaft which drives the camshaft through bevel gearing. This is called the upper vertical shaft and has a disconnecting joint above the level of the crankase so that it forms a unit with the cylinder assembly. Thus cylinders, valves, camshaft and camshaft drive form a complete unit which is both light and compact.

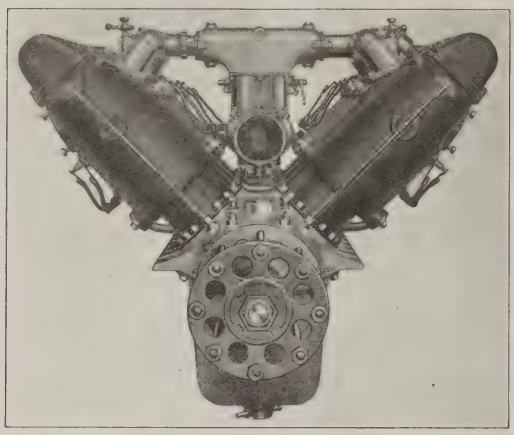
Owing to the nature of the cylinder assemblies the crankcase is comparatively simple. There are upper and lower halves, split on the center line of the crankshaft, and the respective halves of the bearings are carried directly in the crankcase halves. The upper and lower crankcase halves are bolted together very strongly, and since each half takes its share in supporting the crankshaft, the case as a whole is very rigid and light in weight.

Both halves are aluminum castings and the upper half has a projecting foot running the entire length of the case on each side, forming the bedplate from which the motor is supported.

In the upper half, at the rear end, there are two short shafts in bronze carriers called the lower vertical shafts. Each of these shafts has a bevel gear at the lower inside and meshing with a bevel gear on the crankshaft. The upper ends of these two shafts project above the crankcase and are slotted to receive the tongues on the ends of the upper vertical shafts which are attached to the cylinder blocks as described. It is



Model E or I motor ready for shipping. This is the condition in which the motor's weight is taken. The carbureter is in position



thus possible to remove and replace cylinders without disturbing any of the camshaft drive gearing.

The lower half of the crankcase supports another shaft with a bevel pinion at its upper end, this pinion meshing with the same gear on the crankshaft which drives the camshafts. This shaft is vertical and mounted in a bronze carrier socketing into a hole in the aluminum of the case. The lower end of the shaft connects by a tongue and groove with the shaft of the oil pump, the latter having its cast iron body socketed into the crankcase from beneath.

The oil pump shaft passes right through the pump and drives the water pump, which is attached to the outside of the crankcase immediately beneath the oil pump. Thus one bevel gear on the crankshaft drives the two camshafts, the oil pump and the water pump. This completes all the gearing

How the magneto may be timed through adjusting the coupling

Front end view of smaller motors

on the motor except the magneto drive, which is described later. All shafts run at one and a fifth times crankshaft speed except the camshafts and magneto shaft.

The crankshaft is hollow throughout for lightness and for the passage of oil. It is supported on four babbitt faced bronze bearings and one ball bearing, the latter being at the rear end immediately behind the bevel gear. The front end of the crankshaft has a taper on which the propeller hub is mounted and directly back of this is a ball thrust bearing housed in the crankcase.

At the rear end there is a difference between the Model A and the other two models. Model A crankshaft has a plug screwed into the end which can be changed for special attachments when it is desired to take a drive from the end of the shaft for a special oil pump or a starting crank. Models **I and E crankshafts have a screwdriver slot in the end** which is always used to drive the magnetos, the magneto mounting being different from that of Model A. There is also a difference in the form of key used on the taper end for the attachment of the propeller hub.

(To be continued)

THE LIBERTY STARTER

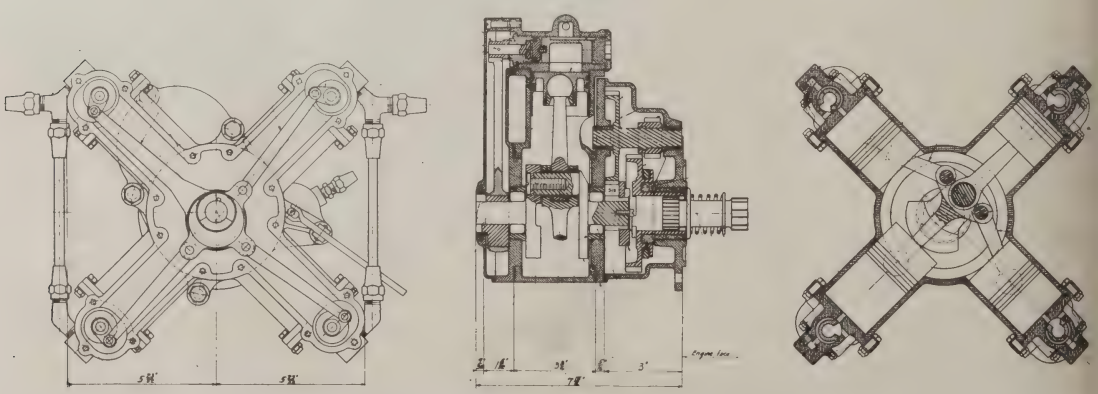
THE Liberty Starter is a four cylinder radial two cycle air motor and compressor with a bore of 2¼" and stroke of 2¼". As a starter it has 9 to 1 gear reduction on final drive to motor. It pumps direct drive at engine speed.

The valve construction is a semi-rotary of the Corliss type, having universal joint action to rocker shaft. The driving member between the rocker shaft and the valve not only performs the function of a universal joint, but is so constructed that the air pressure in valve chamber presses it against the end of rocker shaft bearing sealing the chamber airtight. It also permits the valve to be floated and held against the seat by the air pressure. This entirely eliminates the use of troublesome soft packing where valve actions are used.

The crank shaft is carried on roller bearings. All parts are idle except when brought into action as a pump or a starter.

The Liberty Starter has been approved and is being used by the United States Navy. The Japanese government recently placed an order for a large number.

The usual attachment on such as the Liberty, Hall-Scott, Renault and Bugatti motors is by bolting direct the flange of starter to the flange on motor. A suitable flexible coupling is provided for the drive to the crank shaft. Where flanges are not provided, such as the Curtiss V.X., etc., arms are provided for supporting the starter on engine runners.



Although it weighs but 30 pounds completely the Liberty Starter is capable of starting the largest engines in service, such as the Liberty, Hall-Scott, Renault, Bugatti, etc. Its compactness lends itself to the requirements of installation on aeroplanes where but little space is available for "accessories" of any kind; though the "Liberty" can hardly be termed an accessory for it has really become a necessity.

Its length is only 8". It cranks the engine at 150 R.P.M. or more, and it replenishes its own energy in half a minute. The tank weighs 12¼ lbs., bringing the total weight of the outfit to 49 lbs.

After the engine is started, the Liberty starter automatically disengages and remains disengaged until it is needed again either as a starter or compressor.

When the air pressure in the tank becomes low, the compressor is put in operation by pressing a button on the control valve while the engine is running at low speed. When engaged, the engine must be run at from 1200 to 1400 R.P.M., and when the pressure has been brought up to 230 lbs., the mechanism automatically becomes disengaged.

Hundreds of these starters are in service throughout the country, and the New Mail Service is installing them in the larger machines.

Elevation and Sections of the 4-cylinder "Liberty" Starter

The Gallaudet D-4 Light Bomber Seaplane

FOR light bombing operations, the Navy Department has adopted the seaplane designed by Mr. Edson Gallaudet, whose wide practical experience in aeronautical design, and particularly machines adapted to Navy requirements, has placed him in a position to bring out a machine which has attracted considerable admiration.

The latest machine is the "Gallaudet D-4 Light Bomber Seaplane." In general it follows somewhat the lines of the Navy seaplane described in AERIAL AGE, May 14, 1917, but the latter machine was provided with two 150 H.P. Duesenberg engines, whereas the Light Bomber uses a single 400 H.P. Liberty "Twelve" engine.

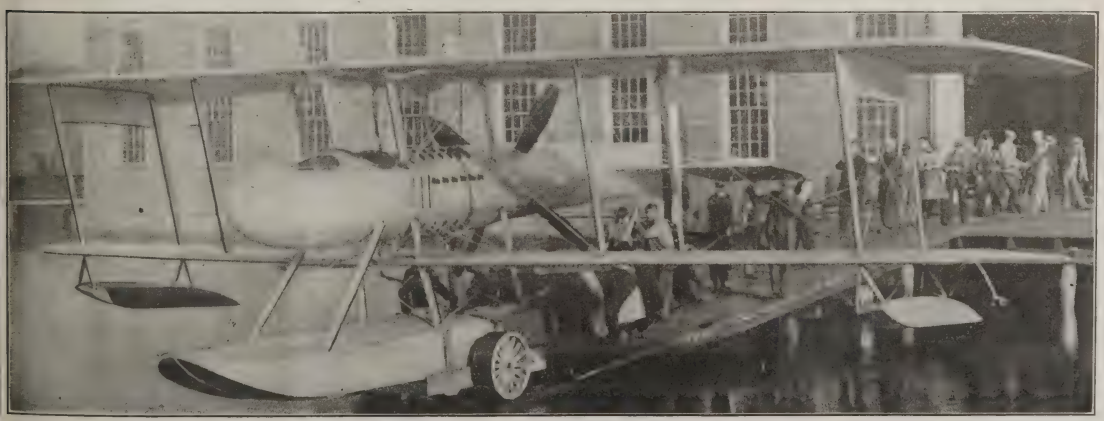
Several refinements in detail have been incorporated in the newer design, and it is probable that the Gallaudet is now the fastest seaplane ever built. Its manoeuverability is exceptionally flexible, in spite of difficulties usually encountered in seaplane design.

On December 12th a series of tests of the D-4 Seaplane were carried out during a two-hour run over Narragansett Bay by Lieutenant E. F. Stone, U. S. N. The tests show the machine to be capable of cruising at 78 miles an hour, while the engine turned at 1,260 r.p.m. At this speed the fuel consumption was 16 gallons per hour, and the cruising radius 7.19 hours, in which time a distance of 561 miles could be covered.

General Specifications

Span, upper plane	46'-6"
Chord, both planes	7'-0"
Gap between planes	7'-0"
Total wing area	612 sq. ft.
Weight, machine empty	3,800 lbs.
Weight of useful load	1,600 lbs.
Weight, fully loaded	5,400 lbs.
Maximum speed	126 m.p.h.
Slowest landing	42.6 m.p.h.
Slowest getaway	46.0 m.p.h.
Climb in two minutes	2,100 ft.
Flying radius at full power	3 hours

The useful load is made up of the following:



Water	115 lbs.
Pilot and observer	350 lbs.
Fuel and oil	650 lbs.
Ordnance	95 lbs.
Bombs	390 lbs.
Total	1,600 lbs.

NINTH—SUPERVISION OF PRODUCTION—WASTE

Little need be said with respect to the supervision of the production of engines. Although the numerous changes in the Liberty engine, and the remedying of the defects which were disclosed, necessarily involved considerable outlays, the losses due to these causs can hardly be said to be greater than would naturally be expected in the development of a new high-powered motor for aeroplanes. It has already been pointed out that the actual cost of the first lot of 600 motors at the plant of the Packard Motor Car Company, which was earliest in production, was as high as $3873 per engine, and that this cost was subsequently reduced so that the average cost of the first 1200 motors was $3442, and that it is expected that the cost per engine at this plant will fall below $3200. Again, the actual cost of the first lot of 600 motors at the plant of the Lincoln Motor Company was $3583, and it is believed that motors can now be produced at this plant at a little, if any, over $3000 per engine. The enhanced cost of the first lots of engines may be said to reflect in large measure the expenditures which could have been avoided had there been no changes in design, but these outlays fell within the range of reasonable experimentation and can not justly be regarded as showing a lack of careful supervision.

The chief losses, which may be properly characterized as waste, have been in connection with the production of aeroplanes. A statement has already been made (*ante*, p. 15) of the cost of the Standard-J1 training planes which were condemned as dangerous in June, 1918, because of the unsuitability of the type of engine. The expenditures on the Standard J-1 planes, including the engines, to September 30, 1918, amounted to about $17,500,000, and the amount which may ultimately be saved if these planes are utilized with another engine can not now be stated.

The changes in the DeHaviland 4s which have been detailed (*ante*, pp. 126-131) caused great additional expense which could have been avoided had there been a more efficient organization and prompt decision as to equipment. The most serious waste, however, in connection with service planes was in the work and materials thrown away on the Bristol Fighter, which was in course of production at the plant of the Curtiss Aeroplane and Motor Corporation, and was finally condemned in July, 1918 (*post*, *p.* 157).

Under the cost-plus contracts it was of the utmost importance that there should be the most careful supervision of production and an adequate system of cost accounting so that useless expenditures should be avoided and actual costs carefully determined. This undertaking was difficult in itself, but it was rendered even more difficult by the demand for haste and the necessity of quickly providing a large force of inspectors and accountants in a novel undertaking. Manufacturers were in constant opposition to what they regarded as unnecessarily technical requirements by accountants, and the government representatives themselves were admonished by their superior officers not to let strictness stand in the way of production. And it could hardly be expected that this large matter of industrial supervision and cost accounting could be adequately handled under the restrictions of military organization. Moreover, not only was efficiency hampered, but the door was open to abuses, and despite the fidelity of many who sought to protect the Government, wasteful conditions were permitted to exist which were wholly inexcusable. It should also be said that a large outlay has been caused by the fact that the Army and Navy each maintains a complete staff of accountants so that, for example, in the North Elmwood plant of the Curtiss Company, where both Army and Navy work is being done, there are two sets of Government employees at work in all branches of cost-plus accounting under the respective contracts.

Labor

Labor conditions generally were unsatisfactory. In the labor market the Government was largely competing with itself. At the plant of the Packard Company the labor turn-over is from 400 to 600 per cent. a year, which would mean 40,000 to 60,000 men coming and going in order to maintain an organization of 10,000 to 11,000 men. The larger portion of this "floating," as it is called, occurs among probably 4,000 to 5,000 men, and the testimony is that in some departments there has been a complete change about fifteen times a year. Women have largely been employed in many plants with satisfactory results. The plant of the Wright Martin Aircraft Corporation at New Brunswick, New Jersey, is a conspicuous exception, few, if any, women being employed in the shops. The testimony is that the local labor organization has taken a stand against the employment of women, and accordingly this has not been pushed by the management.

In the case of the Wright Martin Company also it was apparent that a very large proportion of the employees were within the draft age as fixed by the Selective Service Law of May 18, 1917. The records show that on August 15, 1918, 41.36 per cent., or 2,300 of the total number of employees (5560) at the New Brunswick plant were within the draft age, and of this number 15.83 per cent. were in Class 1. The report of the representatives of the Government at this point states that the method used by the Company for securing deferred classification and indefinite furloughs is as follows: When a man is employed who is in Class 1 of the draft, he is given a week to "make good." If he then is found to be efficient his foreman induces an application for deferred classification, and if this is refused by the District Board and the employee is called to camp, a request is made by the company to the personnel department of the Bureau of Air craft Production for his return on indefinite furlough. Prior to August, 1918, the operations of the draft department of the Company were open to serious criticism and exhibited many irregularities. In one case a man, whose duties were such that anyone who could handle a screw-driver could do his work, was drafted and immediate steps were taken to have him returned as a "motor builder." Previous to his employment by the Company he had been employed as a stock clerk by a manufacturer of gowns and he had no previous mechanical experience. In another case a man who was considered a deserter by his Local Board was finally located at the plant of the Wright Martin Company, where he was arrested and inducted into the Army. Affidavits were immediately presented for his return from camp upon industrial grounds, and he was returned accordingly. One who had been a clerk of a carpet company, without mechanical experience, and who had a minor assembly job, was drafted and was returned on indefinite furlough as a necessary employee. A former proofreader, a former skating-instructor, and a former coupon-clerk, who had obtained employment at the Wright Martin plant were drafted and similarly returned. In other cases, men whose work was entirely clerical secured deferred classification on industrial grounds. Cases of this sort have now been brought to the attention of the Provost Marshal General. It is stated by the Government representative that at present the draft department of the Wright Martin Company is in competent hands, and it appears that its work is being done with a better regard for the interests of the Government.

Labor Cost

To establish the labor cost under cost-plus contracts it was necessary that there should be proper time records and suitable provision for the identification and check of employees as they entered and left the factory. The opportunities for irregular pay-rolls, through laxity or connivance, are obvious. The conditions in this respect at the North Elmwood (Buffalo) plant of the Curtiss Aeroplane and Motor Corporation were especially bad. It was at this plant (completed last Fall) that the cost-plus work was done on the Bristol Fighter for the Army and the HS-1 seaplane for the Navy.* There is abundant testimony, with picturesque detail which can not be given here, to the effect that at the North Elmwood plant large numbers of employees were kept on the pay-rolls when they were not needed; through an utter lack of a decent system men and women were paid when they did not work; employees were able to leave the factory without being detected and remain absent for hours while recorded as on duty; employees would ring one another's time cards; men who were without work enough to keep them busy during the day were employed over-time at increased rates; men were brought to the plant on Sundays when there was virtually nothing to do; and for many months there was such demoralization at this plant that it became the subject of contemptuous gossip among the employees and in the community. One of the inspectors for the Navy testifies that as late as July he, with others, went through the plant at night on a tour of inspection, and not only were they able to go from one end of the plant to another without being asked for their passes, but they found absurd conditions of idleness. In one room, "the foreman and three men (were) sprawled out on the floor," and, as he put it, there were "slackers from one end of the plant to another."

It is urged in palliation that the cancellation of the Spad order and the difficulties encountered in the development of the Bristol created a state of confusion, and that the management was constantly expecting to be able to get into production and felt it necessary to maintain an adequate force for this purpose. That the force was increased heavily at the North Elmwood plant during the early period, despite the fact that there were serious difficulties with the Bristol design and the Company was not ready for large production, is beyond question. In October, 1917, the average number of men working at the North Elmwood plant was 578. In December this was increased to 4142; in January, to 5970; in February, to 7029; there was a decrease of a few hundred in March and April, and an increase in May to 7557, and in June the average number at work was 9788. To approximately sixty per cent. of its capacity, this plant was either idle or working only in connection with the Bristol. The employment of men on a large scale when there was not work enough for them had much to do with the virtual destruction of the morale at the plant. But whatever loss the Government has sustained in this way is not nearly as large as it might otherwise have been, by reason of the fact that a careful re-audit is in progress, which should be strictly prosecuted, and final settlement of payments awaits a satisfactory determination of actual outlays.

Employment of Alien Enemies

Among the regulations established by proclamation of the President on April 6, 1917, was the following:

"An alien enemy shall not approach or be found within one-half of a mile of any Federal or State fort, camp, arsenal, aircraft station, Government or naval vessel, navy yard, factory or workshop for the manufacture of munitions of war or of any products for the use of the army or navy."

Under the authority granted by the President to the Attorney General for the administration of the alien enemy regulations, the Department of Justice developed a permit system whereby alien enemies could obtain permits to be employed within a munitions factory, including one engaged in the manufacture of aircraft, within the half-mile zone. The granting of such permits is entrusted to the United States Marshal of the district, who is authorized to issue them if he is satisfied that such action will be in no respect dangerous to the community or the United States. He is required before issuing a permit to confer with the special agent of the Department of Justice in the locality, to make a thorough investigation, to get the approval of the United States attorney or assistant United States attorney of the district, and also to obtain from the employer a certificate in writing to the effect that he desires to employ the applicant and that he is satisfied that such employment will not be to the injury of the community or the United States. Sponsors or bonds may be required and all such permits are revocable.

It will be observed that while the precaution has been taken to require suitable investigation by agents of the Government, the cooperation of the employer, who has special opportunities for obtaining accurate information, is expected. It is manifest that unless the Government is in possession of facts showing the inadvisability of the employment, the certificate of the employer in compliance with the regulations is likely to be most persuasive.

There is considerable difference in the practice of the various companies engaged in the manufacture of aircraft as to the employment of enemy aliens under these regulations. The following illustration will suffice:

The Fisher Body Corporation states: "We do not employ any German aliens in our aeroplane factory or in our aeroplane divisions." On May 22, 1918, Mr. Kepperley, the Vice-President and General Manager of the Curtiss Company, gave instructions that under no circumstances should alien enemies be employed. Despite this instruction some alien enemies, who had previously been employed on permits, were retained in positions of importance. One of these, who began work for the Curtiss Company last Fall, was put in charge of the milling-machine department in the machine shop, and became assistant general foreman of the machine shop at the North Elmwood plant. Another German subject (having a brother in the German navy) who began to work in the Curtiss plant in February, 1917, became foreman in the welding department at the North Elmwood plant and has been at work on all the tubing work and tail units for the Bristol Fighter as well as on the engine braces for the HS flying boats. Another, who had himself served one year in the German army and was discharged on account of wounds, was employed as tool maker at the Curtiss plant until sometime in June.

*The Curtiss Aeroplane and Motor Corporation has seven distinct plants: at Buffalo, the Churchill Street group (including the Churchill Street plant where training planes are made, and the plants at Niagara Street, Bradley Street and South Elmwood, making parts for Churchill Street); the Austin Street plant, doing Navy work, including contracts for the British Government; and the North Elmwood Avenue plant. At Hammondsport, New York, motors are manufactured exclusively. The work, except at the North Elmwood plant, is on a flat-price basis.

The Lincoln Motor Company states: "It is our endeavor to employ none but American citizens or friendly aliens. We are careful and using every precaution to not employ enemy aliens." The Nordyke & Marmon Company is equally careful. Their statement is: "At this date there are no alien enemies employed in the aeroplane-engine division. A very few have been employed in this division from time to time but for only short periods at a time, as it has been our settled policy from the beginning of the war to keep alien enemy employees out of our Government departments, notwithstanding the individual man might be perfectly harmless. As fast as these men have been discovered they have been discharged."

About 200 enemy aliens (including Austrians and Hungarians) are employed by the Packard Motor Car Company. About 200 enemy aliens not Germans, but Austrians and Hungarians) are employed at the plants of the Wright Martin Aircraft Corporation in New Brunswick and Newark. No enemy aliens are employed by that company at its Long Island City plant.

The Ford Motor Company has about 250 German aliens who are employed in departments dealing with Government work. 143 of these are in departments in which from 20 to 60 per cent. of the work done is Government work; 35 are at the blast furnace, and 61 are at the shipbuilding plant which is doing Government work exclusively. These enemy aliens are working under special permit granted on the company's recommendation.

German Sympathizers

The serious risk that is taken in permitting men of known pro-German sympathies, whatever their citizenship, to work in aircraft plants in any important capacity is generally recognized. The opportunities are abundant for delays and interferences in production through the action or inaction of those controlling the progress of production. It is the assumed sympathy with his nation which makes the employment of the German subject dangerous, and the danger may be quite as great in the case of one who, although not an enemy alien, is more friendly to Germany than to the United States.

There have been persistent rumors of pro-German sympathies on the part of employees of the Curtiss Company, but it has been impossible to ascertain to what extent, if any, the demoralization that until recently has existed at the North Elmwood plant of that company was due to any influence of this hostile description. The conditions that existed naturally bred distrust which was reflected in common talk, but facts warranting a definite conclusion as to disloyalty on the part of employees in important positions are lacking.

In the case of the Ford Motor Company, one of the company's employees (who formerly had been in the Educational Department and had represented the American Protective League) testified as to his inquiry into cases of disloyalty. The reports obtained by him exhibit utterances of employees in antagonism to the Government, insulting references to the President, and praise of the Kaiser. In an extreme case, in which the employee reviled and even threatened the President, there was a prosecution and a plea of guilty. The man was fined $300, was released, and the testimony is that he resumed work in the Ford plant. The reports were numerous, and the employee who obtained them testified that there were about 200 employees whose loyalty was seriously open to question, but how many of these were employed in Government work he could not say. So far as the Liberty engine was concerned, his investigation related to half a dozen cases in the Drafting Department in the Ford Company. In this department there was a serious situation which engaged the attention of the management. Its importance was manifest from the fact that the drafting department embraces the tool design and drafting room in which the drafting work upon the Liberty engine is done, and it is possible for one in that department to bring about delays, the causes of which, in view of the multiplicity of drawings involved, it would be difficult satisfactorily to trace. This department was in charge of Carl Emde. There were repeated reports of pronounced pro-German utterances by Emde. A former employee, who had left the plant voluntarily and had later been found with plans and photographs of the plant, was a close friend of Emde's and had been employed in his department. This man, it is understood, has been interned. While nothing conclusive could be established against Emde in relation to his work, the advisability of removing him from a position of such strategic importance was clear to some of the most important men in the management. A conference was held on the subject at which Mr. Ford and the factory managers were present. According to the minutes of this conference reports were read from various members of the drafting department who were in touch with the situation, and who felt that the department was practically a pro-German institution." Several conferees expressed the opinion that Emde should be removed, and one said that in his opinion "in the very nature of things Mr. Emde could not give us everything required to assist the Government of the United States." Mr. Ford, however, was opposed to that course and overruled his associates. Mr. Ford's position and his reasons are thus set forth in the minutes:

"Mr. Ford deliberated and stated that he had heard numerous rumors but in speaking of all he had heard there had not been one thing shown him which would make him change the present head of the drafting department. He felt that it was a time of sacrifice—that in the next few years every man would be called upon to make some sort of sacrifice, and that possibly Mr. Emde, German born, was making his sacrifice now when making drawings for the Liberty motor to be used ultimately against Germany."

This statement of attitude is sufficiently expressive and requires no comment. The proposed removal did not take place. There has been a laxity at the Ford plant with respect to those of German sympathies which is not at all compatible with the interests of the Government. In reference to Mr. Ford's view, those in direct charge of production, who were alive to the situation, have had to pursue a policy of constant watchfulness and supervision instead of being free to take the precautions which the exigency demanded.

Materials

The leading causes of waste in material were engineering changes and faulty workmanship. As material was rendered useless it was scrapped, and there is no little evidence of a lack of care in securing salvage. For the losses due exclusively to changes in design after authorized production had begun, the manufacturers can not be regarded as responsible; and these losses, while they cannot be accurately computed, are undoubtedly heavy. Their extent, of course, is proportioned to the stage of production reached when changes were directed; and with respect to the service planes the history of production at the Dayton Wright Airplane Company, the Fisher Body Corporation and the Standard Aircraft Corporation discloses the same conditions varying only in degree as to the delay and waste caused by repeated changes.

With respect to the intelligence and efficiency of the inspection, and the extent to which rejections have been on sound grounds, there are naturally differences of opinion and complaints and counter-complaints the basis for which can not be satisfactorily determined. It is to be noted that the rejection of spruce which has gone into production has reached a high percentage. Even at one of the best plants the Government representative puts the percentage as high as sixty per cent. after allowing for salvage, and at other points the percentage of rejections was probably higher.

A poor industrial organization such as existed at the plants of the Standard Aircraft Corporation and the Curtiss Company (North Elmwood plant) did not favor economical production, and in the case of the former company conditions were aggravated, as already pointed out, by the assignment to that Company of a large number of small orders for varied work. At the North Elmwood plant of the Curtiss Company the waste which was incident to delay and changes was vastly increased by irregular practices. Thus, in order to keep men busy who apparently had no proper work to do, there was excessive production of parts. A production order might be for 500 parts, but the actual production might run to 5000 or even more of these parts until this unwarranted conduct was discovered and stopped. There is instance after instance of excessive production which served to increase the size of the scrap heap when a change made the parts useless.

Again, at this plant when a change would lead to an order stopping the production of parts, production often would continue despite the order. As an illustration, one witness testified that he had personally given a stop order on certain metal parts and found two weeks after, in going through the metal shop, that they were still making the parts, sending them through the various operations and working over-time on their production. During periods of idleness employees devoted their time to making clocks and toys out of the materials at their command in the factory. Excess material was scattered about the factory without a proper record being kept of it. And it appears that material would be sent to the scrap heap instead of being properly salvaged, in order to cover mistakes.

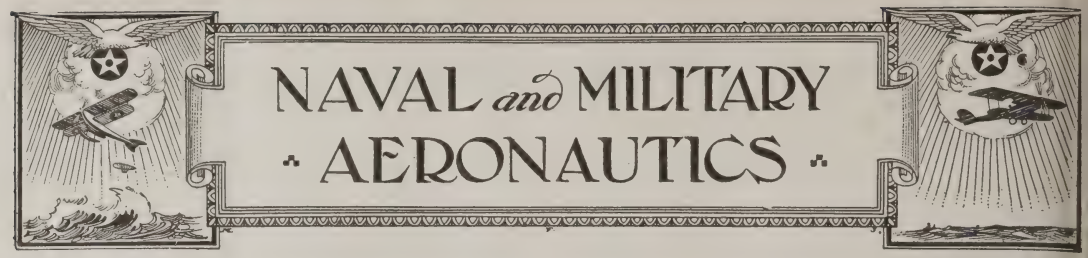
There was also a lack, at the Curtiss plant, of proper records of material. In the case of steel stores there was confusion between what had been supplied for the Army work, for the Navy work, and for the Curtiss fixed-price work, so that accurate accounting based on the ledger entries was wholly impossible. And in addition to other manifest delinquencies, there was an absence of proper plant protection. The situation of the Company in view of its experience with both the Spad and Bristol orders was undoubtedly a difficult one, but the lack of competent industrial administration is too clear to admit of dispute and has freely been confessed.

There has been little evidence at the North Elmwood plant of the exercise of the broad powers of the Government to prevent these abuses, and the fact that conditions were permitted to continue reveals the failure of the representatives of the Signal Corps to take proper steps for the protection of the Government's interest. There was, however, such an absence of system on the part of the Company in the keeping track of parts, and so many changes in the persons employed, that, while there is abundance of general testimony, it is practically impossible at this time to trace particular instances of dereliction to individuals in order with suitable particularity to support definite charges. The divided responsibility which resulted in giving the design of the Bristol so largely into the control of the representatives of the Curtiss Company was also a source of embarrassment, and the extreme haste to make up for lost time added to the confusion. Conditions through the Winter and early Spring were chaotic and the improvement that has been made since that time has been unnecessarily slow. It is fair to say, however, that recently there have been changes which promise a needed betterment in the industrial organization.

So far as the loss of the Government in connection with the Bristol is concerned, the payments already made to the Curtiss Company, according to the Government accounts, amount to upwards of $2,000,000 exclusive of advances, and as already stated, the Government has estimated that the loss, including claims growing out of the cancellation may reach $6,500,000 (*ante*, p. 16). The Government, however, has a margin of security by reason of deferred payments, and a re-audit is in progress which must be completed before a final settlement is made for materials furnished. The loose methods employed by the Company should be taken into consideration and a final settlement should be reached only upon satisfactory proof of proper outlays.

Overhead Charges

In the course of production payments have been made on account of overhead charges upon the basis of a general estimate; that is, by taking a percentage of other outlays, which seems to be justified in the experience of the plant, as representing the overhead expense. The overhead expense embraces general administrative outlays, including executive salaries; and the theory of the cost-plus contract is that the Government pays the expense of superintendence as a part of the cost.



It is, of course, important that fair salaries should be allowed, and all exorbitant demands rejected. Reference has already been made to the salaries paid to the executive officers of the Dayton Wright Airplane Company, who were at the same time the stockholders in a close corporation and divided their time with other companies from which they received high salaries. There appears to be no justification for even the temporary allowances to the Talbotts and Kettering of annual salaries aggregating $100,000, and the explanation furnished that the "relations with the contractor were somewhat delicate at first, and, moreover, the Company was in crying need of cash, and any withholding of amounts due was sure to create much friction," is not convincing; inasmuch as the individuals, and not the Company, got the money, and it is difficult to see how "friction" in this matter could have injured the Government. It is also stated that when the salaries were allowed in the Fall of 1917, dating from August 1, 1917, it was felt that it was a matter of considerable importance "that would have to be passed by Colonel Deeds, who was in charge of the Equipment Division," but Colonel Deeds testifies that he knew nothing of the salaries that were paid to these officers.

It should be said, however, that these allowances, under the terms of the contract, should be regarded as tentative, and that it is within the authority of the Finance Department in its final settlement to adjust the matter on a fair basis. And that is the position of that department.

Even more extraordinary was the salary paid by the Standard Company to its President, Mr. Mingle, at the rate of $63,000 a year, which is sought to be charged as a part of the cost of operations. This, however, has not been allowed. The question what would be a proper allowance has been under consideration. Several vouchers have been passed which represent merely payments on account, or payments "subject to adjustment," and it is stated that the amount of Mr. Mingle's salary thus far actually allowed is at the rate of $15,000 a year.

The adjustments of overhead expense, as are the other payments on vouchers under the cost-plus contracts, are subject to a revision of accounts and it is within the power of the Finance Division in the ultimate adjustment of cost in accordance with the terms of the contract to protect the Government against any claims on the part of the contractors which may be found to be unjustified.

BUILDING A HUMAN MACHINE

Naval Aircraft Factory, Navy Yard, Philadelphia, Pa.

ON October 1, 1917, the first mechanic was hired at the Naval Aircraft Factory, the only government-owned industry of its kind in the United States. On November 1, 1918, there were 3642 men and women employed in building flying boats for the Navy.

When the Navy undertook the work of building its aircraft plant and when, one after another the structures of steel and concrete and glass began to rise at League Island it became necessary to fit into the huge scheme the human material.

It was something new. Executives, engineers, technical men, clerks and mechanics had to be gathered together and nearly all of them taught new duties. And the best answer that might be given is the simple announcement that to-day the Naval Aircraft Factory is ahead of its schedule of production.

The Navy could not call upon employees from other aircraft factories because these were already short of skilled aid. It had to develop its own organization. Civil Service rules, at first looked upon as a handicap, had to be dealt with and Naval regulations were to be taken into consideration at every step.

To-day the organization is complete; it is effective; it is as thoroughly stabilized as one of the winged boats that it sends to the fighting men in Europe. And do not forget this point: that out of the nearly 4000 employees at work to-day not more than twenty-five had previous experience in other aircraft factories.

Testimony of the generally satisfactory calibre of the employees secured under Civil Service is found in the fact that it was necessary to hire a total of only 6035 persons to provide for the growth of force and for replacements. In private industry it is often necessary to hire 8 to 10 persons before a satisfactory employee is secured. Further testimony of the generally satisfactory calibre of the working force recruited under Civil Service is found in the fact that only 139 persons have been discharged for cause since the start of the factory.

In spite of the bareness of the labor market and the fact that the calibre of workmen available in that market is reputed to be low, and although unsatisfactory employees have often been hired, the quality and spirit of the workmen of the Naval Aircraft Factory are regarded by the Manager as very much superior to those of most of the emergency plants created by the war. Witness the fact that $840,450 was raised in the Third and Fourth Liberty Loan by the employees of the Naval Aircraft Factory—$350,000 in the Third Loan and $515,450 in the Fourth Liberty Loan.

The hulls of the seaplanes are the hardest to build and boatbuilders were essential. The heads were informed that real old-fashioned boatbuilders no longer existed. A representative of the Naval Aircraft Factory was sent to the New Jersey coast, and in two trips visited the main boatbuilding centers between the Toms River and Red Bank. Old Boatbuilders, who for years had run their own small boatshops near their homes, were visited. The need of seaplanes to fight submarines was pointed out. Patriotism runs high among these Jersey shoremen, and many an old boatbuilder closed up his shop, bade good-bye to his family and went off as one expressed it "to help beat them Dutch." In all, these trips induced nearly eighty boatbuilders to come to the Naval Aircraft Factory, and they have proved to be excellent mechanics. Trained to do *all* of a job, they readily accommodated themselves to do any kind of work. A course in blue print reading was given them so that those unacquainted with blue prints might better understand the complex blue prints of a seaplane.

These men have been the nucleus around which has been built up the organization in the Boat Shop which turns out a boat hull a day, thus overcoming one of the most serious difficulties at the start of the Factory.

Every man in a supervisory position in the Boat Shop has been secured originally by the Employment Department as a mechanic and has since won his position from the ranks. The Foreman of the Boat Shop, William T. Rote, was one of these. "Billy" Rote is from Island Heights, New Jersey. He is Mayor of the town. For twenty-five years he has run a small Boat Shop making yachts and racing boats for summer visitors. When asked to come to the Naval Aircraft Factory, he demurred. He couldn't leave his business. He was Mayor of the town, and had just been re-elected. But he would do anything to "beat the Dutch," and visited the plant to "look it over." The opportunity of working in a big Boat Shop on boat hulls for the Government won him over. On January 3rd, 1918, he reported for work carrying an immense chest of tools. For two months he worked with his tools. On February 24th, 1918, he was placed as assistant straw boss in the Pontoon Department. The straw boss was soon moved to another department and Rote became straw boss of the Pontoon Shop where he again made good. A new foreman was needed to put the big Boat Shop in shape and Rote was given the job. He took it and, like Henry Ford, instituted progressive assembly in manufacture. The output in boat hulls increased so rapidly that one boat a day was turned out where the original estimates had provided for only five boats a week.

On June 3rd, 1918, "Billy" Rote, Mayor of Island Heights, N. J., received his appointment as Foreman Boatbuilder.

The plant has been built up on such examples of growth and development. After it attained a certain size the Manager sought for desired abilities from within his own organization, rather than by hiring in strangers to do important work. To promote this aim there has been made a vocational index card for each employee to show his abilities in detail so that valuable abilities in the plant might not be lost sight of when promotions were considered.

Certain unions, especially the Patternmakers' have been of assistance in sending men. But most of the new employees have been secured in a flow of employees who have made application in person. From the great mass of trades, of abilities, of experiences, there had to be selected those with the necessary skill to do the work.

Among those who applied in person was a disabled Belgian Soldier who had escaped from a German prison camp, and a former French Aviator who had been injured and declared unfit for military service.

The Frenchman, Joseph Merger, was born in Paris 23 years ago. When he was 15 years of age, he started a course in the

Lycee St. Louis in order to specialize in motors and electricity as applied to motors. This he continued for 3 years.

War was declared before he finished his studies and the French Army was mobilized, August 20, 1914, when the call came for volunteers he immediately joined the French Infantry.

On September 9th he partook in the attack upon Arras. In his first charge he was wounded by a shrapnel explosion. He was sent to a hospital in Amiens.

Upon his discharge, he answered a call for volunteers to join the Oriental Expedition which was to go to Salonica. He arrived at the Island of Toratos, June 7, 1916. He participated in a retreat of the Servian forces and received a wound in the head.

He was later sent to a Replacement Depot for a stay of several months, during which time he entered the Aviation service.

During one of his trial flights, he met with an accident and was badly hurt. Some months later he was declared unfit for military duty.

Merger asked the consent of his parents to make a voyage to America in order that he might learn our methods of working with motors,—and further to perfect his knowledge along this line.

The 15th of July, 1918, found him aboard the Niagara which sailed from Bordeaux to New York. After having interviewed the French Consulate at New York he arrived at the conclusion that Philadelphia was the industrial center of the United States and sought his goal in that city.

He had no acquaintances in Philadelphia whatever, and his search for information regarding the proper place for employment was not fruitful and he decided to return to New York. After having purchased his ticket at Broad Street Station, he inquired regarding which train he should take for New York and happened to come upon a member of the War Community League. This women asked him what he had been searching for in the city and upon hearing his story, sent him to the War Community League where he was advised to seek employment at the Naval Aircraft Factory.

The outstanding thing about Merger's interview for employment was the fact that he first declined employment unless he could work a 12 hour day. That is what they did in France in war time, he said, and he wanted to do the same here. Out of Merger and men like him have come the units now composing the Naval Aircraft Factory organization.

But the responsibility of the Employment Department was not limited to the securing of help. In an industrial plant a man's future and happiness are dependent upon his immediate superior's judgment. Ordinarily that judgment is sufficient and is just, but it frequently is not, and the manager believed that it was good business to have a department to which every employee might have the right of appeal,—a place where some one who was not responsible for production and under the pressure that implies might fairly consider both sides and render an ex parte decision in a dispute. Such practice was considered not only good humanity but also good business. This responsibility was placed in the Employment Department where grievances and charges of unfair treatment are regularly considered as matters of highest importance to the construction of seaplanes.

The Employment Department passes finally on rates, transfers, all discharges, exemptions and all employee activities. There are service workers under its supervision. A training school for the training of women is maintained and enlisted men are trained for duty at the American Aviation Bases abroad where the seaplanes are re-assembled and repaired.

NAVAL AVIATION

(*Continued from page* 806)

Stations Established on European Coasts

On July 1, 1917, there were no naval air stations abroad which were being operated by American naval forces. During the year, however, the Navy Department took over the operation of coastal patrol stations from our allies, and at the present time stations in Ireland, England and France are being operated by United States naval-air forces. It has been necessary to ship from the United States almost all the material for these foreign stations, which includes hangars, machinery, and practically every form of equipment that is being used at those points. Coastal patrols of the east Atlantic coast have steadily increased with respect to the number of flights, the total distances covered, and with respect to general efficiency and actual results. In addition to carrying out active anti-submarine patrols, the stations abroad have been extensively engaged in assisting the fleet with convoying of troops and merchant ships.

As illustrative of the live and energetic type of efforts that are being made, it may be mentioned that the French Minister of Marine, in recognition of the work that was done by an American dirigible on April 27, 1918, officially complimented the American forces. On that date a continuous flight of 25 hours and 43 minutes was made, during the course of which three convoys were escorted for 13 hours and 50 minutes in a zone which was mined and patrolled by the enemy. The official citation said in part that "such an ascension, which constitutes by its duration a remarkable performance, gives us proof of the most excellent qualities of endurance, of energy, of *sangfroid,* and of technical ability of the American forces."

On July 1, 1917, there were only about 50 seaplanes in commission. One year later there were approximately 100 seaplanes in commission that were being used for patrol purposes and 324 seaplanes that were considered as training seaplanes. The early seaplanes were of the *N-9* and *R-6* types, and there are now being used almost entirely for training purposes. With the development of the high-powered Liberty engine came the development of the flying boat, and it is these large flying boats which are being used for coastal patrol work. There has been no undue delay in supplying seaplanes, and the delivery of service seaplanes has been up to schedule. The delivery of dirigibles and kite balloons has also been sufficient to meet the requirements of the program which was undertaken.

The Naval Aircraft Factory

Shortly after the United States entered the war an investigation was directed to determine the feasibility of constructing and puting ino operation an aircraft factory to be owned by the Navy Department, with the three objects of assuring that the control of the manufacture of a part, at least, of the Navy's aircraft should be under the Navy Department, of having a plant wherein Government work of development of aircraft could be carried on under the close direction and control of the department and its bureaus, and of accumulating cost data for the department's guidance in dealing with questions of cost arising out of contracts with privately owned aircraft factories.

On July 27, 1917, the project was authorized by the Secretary at an estimated total cost of $1,000,000 for construction at the navy yard, Philadelphia, Pa., at which yard there was ample land available already owned by the Government and where advantageous conditions as to labor, material and transportation by water and land could be expected, and where the river area gave promise of sufficient space for test flying of aircraft. On October 16 the first power-driven machine was started, just 67 days after ground was broken.

Permanent Buildings

Aircraft have come to stay, and it was clearly good policy to erect a structure of permanent type rather than temporary, particularly as it was found that the cost and time required to build a permanent structure were little, if any, more than for a temporary structure, which would at best give poor shelter to the project during the period of the war.

It was contemplated that the factory should build school planes; that is, simple machines used for the instruction of flyers; but as the demand for the largest type of service planes used in anti-submarine warfare for patrol and convoy was more pressing, the factory was put into production with the larger machine known as the *H-16* flying boat. It measures 96 feet from tip to tip of wing, the wings being on a boat about 45 feet long, of very light structure, instead of on a fuselage and wheels, as in the land type of machine. The plane is equipped with two Liberty engines and four machine guns, carrying a crew consisting of a pilot, one or two observers, a mechanician, and a wireless operator.

On March 27, 1918, 228 days after ground was broken for the factory and 151 days after receipt of the plans, the first service machine was given its first flight, which was successful, and a few days later this boat with another one was shipped to England. These two boats were the first of the original manufacturing order, which was completed July 2, 1918, ahead of the time scheduled for its completion. Too much praise cannot be given to Commander F. G. Coburn, the capable naval constructor and executive under whose direction this plant was constructed and is operated.

Enlargement of the Factory

In the meantime, in December, 1917, an enormous expansion of the naval aircraft building program was inaugurated to meet the demands overseas and to take care of the major portion of this expansion, an extension of the naval aircraft factory facilities was ordered, estimated to cost $3,250,000. All these buildings were constructed by private contract after competitive bidding. The estimate was subsequently further increased by approximately $500,000 to cover a hangar and the necessary water-front improvements. This hangar will have one of the largest door openings in any hangar in the world. Besides this hangar, the extension included an assembly building 1,100 feet long, 350 feet wide, a 6-story concrete storehouse and a 3-story office building.

Utilization of Non-Essential Industries

At the same time contracts for the plant extension were awarded, other contracts were placed in privately owned factories not engaged on aircraft or other war work for the manufacture of parts to be shipped into this new plant for assembly. Over 7,000 persons were thus employed, in addition to the 3,700 persons in the naval aircraft factory proper; and the factory management directed these plants as if they were departments of the factory proper. This policy of manufacture gave promise of quickest deliveries, inasmuch as it took advantage of existing manufacturing facilities and organizations for the construction of parts and recognized the necessity of erecting only those buildings necessary for assembling, testing and packing the complete planes. Early in the spring this plant was put into production, even before its completion; and when in June, 1918, the first plant was at its designed full capacity, the new one was well under way in production.

Employment of Women

More difficult that the task of providing the plant and its equipment was that of assembling the working force and its directing personnel. The aircraft manufacturing industry was in its infancy and men skilled in aircraft construction were not to be had. At no time since the factory was started, and its total force has risen to 3,700 persons, have there been as many as 25 persons in its employ who have worked in aircraft factories; and the entire directing personnel was recruited from automobile factories, machine shops, and other factories doing work similar to some of the branches of the work of manufacture.

The employment of women on this work was begun at an early date, the maximum number reached being about 900. Women are admirably adapted to this class of work, and those in the factory did their part most effectively. They were employed on the principle of equal pay with men for equal work.

(*To be continued*)

FOREIGN NEWS

Weir Announces British Air Aims

Manchester, Dec. 20, (British Wireless Service).—Lord Weir, the Air Minister, in a speech here at a luncheon in his honor given by the Manchester Corporation, said that in August, 1914, the British flying service consisted of 1,285 officers and 1,853 men of other ranks. In November, 1918, the strength of the service was 30,000 officers, 260,000 men, and about 30,000 women and boys.

"We now have aeroplanes which can carry a crew of seven and thirty passengers to 10,000 feet, travel at 100 miles an hour, make a non-stop journey of 1,200 miles, and alight on the sea and rise again with a full load," he continued.

"The success of the operation side of air transportation will depend upon the following measures: Development of navigational instruction, creation of an energetic meteorological service especially designed to help air transport, the adoption of improved systems of wireless telegraphy and telephony, and the adoption of a first-class system of day and night marking of landing places.

"I am convinced that co-operation between the activities of the State and the activities of private firms will produce the finest results. The State must be a pioneer. It must exercise control, but it must not monopolize.

"I conceive a Government department, which will not be an autocrat, but an elder brother to all sides of aviation. Its first essential step should be to organize international flying. This will involve an international aircraft convention.

"We have already drafted the articles of this convention, which is being submitted to our allies. If it is approved, an international air conference will be held, and I have reason to anticipate that within the next four or five months the principal nations of the world will have reached an agreement on this momentous matter."

London, Dec. 20.—Shaw Desmond, correspondent of the Daily Express at Copenhagen, telegraphs as follows, under Thursday's date:

"I have received private information from an authoritative source that Germany is making enormous secret preparations to secure mastery of the air. German insurance companies are seeking cover in neutral countries, especially Denmark, for insurance relating to a great chain of aeroplane factories and aerial experiments.

"Factories throughout Germany are now being converted from war activities to the building of aeroplanes and engines. Staffs including engineers, designers and pilots are being trained.

"Gigantic hangars and flying stations are to be laid down in all the principal towns. The first step will be to link up the chief German centers with Berlin and then Berlin will be linked with the outside world, including Paris, London, and even New York.

"Although lighter-than-air machines are not regarded as of serious practical value, a Zeppelin will be used to make a transatlantic flight in the Spring."

Would Limit Uses of Aircraft in War

Lemans, France, Dec. 22.—Speaking here to-day at the Wright-Lafayette ceremonies, when the foundation stone of the Wilbur Wright monument was laid, American Ambassador Sharp deplored the "wicked uses to which aviation has been perverted by the enemy.

"The very horrors of its abuses," said the Ambassador, "will compel the civilized nations hereafter to abandon forever the employment of aircraft for the casting of bombs. As it is a barbarous method of murdering innocents and is lacking in military value it should be outlawed by the coming League of Nations. The submarine—that other evil genius of modern warfare and even more monstrous—should similarly be banished."

Henry Simon, French Minister of the Colonies, representing the Government, traced the effort made by the United States in the war, continuing:

"Without such aid supplied to our allies and at the same time to ourselves I do not know whether the war in the spring of 1917 could have been continued. Without the formidable push of last March and the monthly contribution of American troops I do not know whether Marshal Foch's decisive manoeuvre in the summer of 1918 could have been possible."

The monument is being erected by the Aero Club of France, and will mark the place where Wilbur Wright made his first flight in France on Aug. 8, 1908.

Big Steamship Lines Discuss Air Service

London, Dec. 20.—Indications that aeroplanes are to play an important part in transatlantic competition with the resumption of normal conditions again has been further strengthened by the informal consideration among some shipping men here as to the possible use of aeroplanes to carry mails and passengers from the principal ports to London.

While some conservative shipping men have not given their entire support to the idea, a correspondent learns that those who forsee the possible development of aerial traffic in the future adhere to the belief that many hours may be lopped off steamship schedules with the co-operation of air forces.

The chief point of competition in transatlantic traffic will be to cut down the time between London and New York. It is argued by air enthusiasts that business magnates will be able to cut off many hours by taking an aeroplane from Plymouth to London—in fact, cutting in half the former express train schedule between Plymouth and London. It is argued also that by the payment of additional postage fee certain classes of letters will reach their destination many hours sooner.

Such an aeroplane service is believed possible eight months in the year. Shipping men believe that the Germans intend using aeroplanes in connection with transatlantic competition in the future.

War Hero to Make Wright Aero Group

Lemans, France, December 24.—A sketch of the plans of the Wilbur Wright statue show it to be a fine conception and in keeping with the highest traditions of French art, according to a dispatch to the New York Sun.

The sculpture will be by Paul Landowski, winner of the Prix de Rome, who made the great reformation memorial in Geneva. He is a sergeant of engineers and winner of the Croix de Guerre.

The statue will stand on a broad base from the center of which will rear a gigantic pinnacled rock symbolizing the summits of the earth. On the top will be the figure of a man striving to climb higher. Facing this will be a representation of the inventor of the modern aeroplane. Inscribed on the monument will be a quotation from Victor Hugo, of which a free translation is:

"I have wings and I dare aspire. My flight is sure. I have wings to brave the tempest and penetrate the sky." The statue will stand in the shadow of the great cathedral, linking early history with Wright's epoch.

U. S. Naval Activities in Europe

The following are extracts from the Report of Admiral Mayo, Commander-in-Chief, Atlantic Fleet:

United States naval aviation in England is carried on by co-operation in two British commands.

The United States seaplane station, Killingholme, Commander K. Whiting, is under the vice admiral commanding on the east coast of England. It has been in operation for some time and does escort of coastal convoys, escort of mine layers in the southern part of the North Sea, and some reconnaissance work in the direction of the Dutch coast.

The northern bombing group, Captain D. C. Hanrahan, is under the vice admiral commanding at Dover, whose jurisdiction extends to naval aviation units in northern France in the vicinity of Calais and Dunkerque. The day bombing squadrons are manned by marines; the night bombing squadrons by the Navy. There has been some delay in the acquisition of suitable night bombing planes, but their delivery will find all in readiness to go immediately to work. The British prescribe the objectives and designate the available free flying time; the operations themselves are carried out by our own personnel. The seaplane station at Dunkerque has operated successfully under the handicap of limited and difficult water area in which to take off and to land.

The assembly, repair, and supply station at Eastleigh was brought into being primarily for the Northern Bombing Group because of the difficulties of transportation to and from the general aviation base at Pauillac. It also does necessary work for Killingholme and for the air stations in Ireland. This base, when visited, was in process of completion and gave every evidence of purpose and capacity to meet all requirements likely to be made of it.

United States naval aviation in France includes all that the title implies, except the northern bombing group mentioned above, and aviation matters are immediately in the hands of Captain T. T. Craven, aid for aviation on Vice Admiral Wilson's staff.

There are eight seaplane stations, three dirigible stations, and three kite-balloon stations, all of which are operated by district commanders in cooperation with the French naval air services in the several corresponding prefectures maritimes. There is also an assembly, repair, and supply base at Pauillac for the general service of all air stations in France and a seaplane gunnery and bombing training school at Moutchie, both of these activities being directly under the headquarters in Brest.

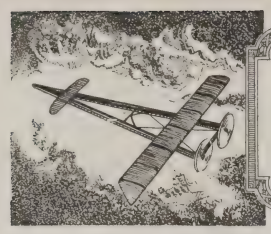
Of the eight seaplane stations, five have been in operation for periods varying from 12 to 3 months, and the remaining 3 are now about ready to begin.

Of the three dirigible stations, only that at Paimboeuf has been in operation for any length of time, and is to be used also for training and experimental work. The station at Guipavas will shortly be in operation. The station at Gujan has been delayed to let material go to other stations which it was deemed advisable to complete first.

Of the three kite-balloon stations, only that at Brest is ready for operation. Test and experimental work have been carried on here since August, 1918, in connection with destroyers and yachts. The station at La Trinite is nearing completion and that at La Pallice is progressing rapidly. The utility of the station at La Trinite seems to be somewhat in doubt, as the original purposes for its establishment have undergone some change due to alterations in the methods of handling convoys, coastal as well as on and off shore.

The assembly repair and supply station at Pauillac is under the command of Captain F. T. Evans, under whose forceful and able direction the station has progressed rapidly to completion and is deemed ready to undertake any and all demands that may be made on it.

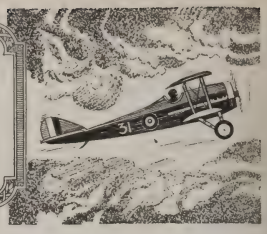
The training school at Moutchic, under the command of Commander R. W. Cabaniss, appears to have a thorough system of instruction, founded on sound bases, and includes study and lectures, as well as ample, practical work. Endeavor is made to keep in touch with and to adopt, where deemed advisable, the best British and French methods. Some of the devices in use for training are ingeniously adapted to the simulation of the conditions obtaining while flying.



United States Naval Aviation in Europe

The establishment of United States naval aviation in Europe has been one of the most difficult and involved tasks which have had to be undertaken and brought into effect. Captain H. I. Cone arrived in Europe for this work about October 1, 1917, and has continued in charge of it ever since. He maintained headquarters in Paris until about August 1, 1918, when he removed to London and was designated as aid for aviation on staff of the commander of United States naval forces in Europe.

There were arrangements to be made with the French and the British as to locations for stations that would be best adapted for cooperation. There were further arrangements to be made as to the procurement of sites or the taking over of the stations already in operation or in process of construction. The Navy Department had also to be communicated with, largely by cable, as to design, quantities, and shipments of material, which upon receipt had to be allocated with a view to completing certain stations as soon as possible while not delaying the progress of the general scheme any more than could be helped.



Delays and mistakes in the shipment of aviation material probably caused more trouble than any other one thing, for when material once arrives in a European port it has been, and still is, a very difficult matter to arrange for coastwise transportation.

Taking into consideration the necessary scope of the project, the difficulties inherent in providing for establishments on foreign soil, and the delays which the magnitude of the undertakings caused in the production and shipment of material (and personnel) from the United States, the state of progress is considered highly creditable to Captain Cone and his assistants.

ELEMENTARY AERONAUTICS and MODEL NOTES

By John F. McMahon

Model Aeroplane Building as a Step to Aeronautical Engineering

THE seat for the aviator is next selected, but drawings of it will not be given, as the builder is at liberty to use any seat of light construction he may choose. The common bucket seat as found on racing automobiles can be selected, providing the sides and back are made from sheet aluminum.

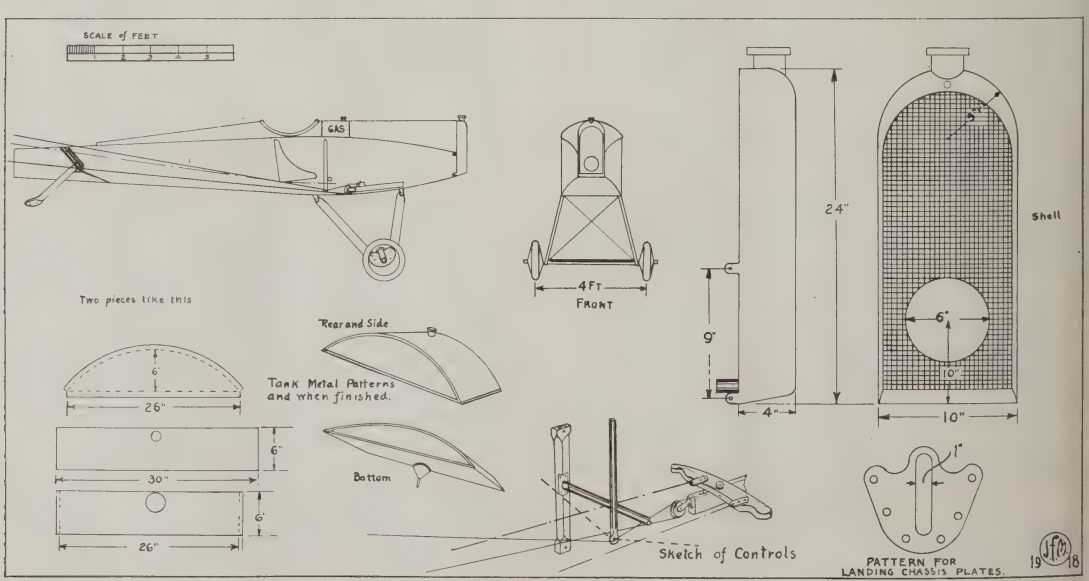
The supports of the seat should be such as to eliminate the possibility of having them bear directly on the longitudinals between the body struts. It would be good practice to hang them from the top longitudinals at a point over the struts, or better still, set on a beam of say, 1½ x ¾" ash, fastened to the large body struts. The seat and fastenings should weigh no more than five pounds.

The radiator can be selected by the builder as well. In fact, any make of light radiator can be used. The radiator should then be cut to the shape and size given in the drawings. This can be done by almost any radiator repair man. The metal casing around it can be brass or aluminum. When the radiator is built four lugs are attached to enable fastening it to the nose of the machine. The capacity should be about 2½ gallons of water, thereby bringing the weight of radiator, water and connection up to about fifty pounds. The outlet pipe at the bottom of the radiator should be set about an inch above the bottom to have it clear the bottom nose strut.

The gas tank is made of sheet tin or light gauge sheet steel to the shape and size given. The metal should be cut to the shape of the patterns. Two being made of sides and one each of the top and bottom parts, a hole for the filler cap being cut in the top or large piece and a large opening for the outlet in the bottom one.

The metal is bent along the dotted lines and each piece soldered with hard solder which, when finished, will give a tank of the shape shown to the right. The filler pipe can be tubing with a plug in it or a piece of pipe and a plug screwed into it. The outlet can be made by simply soldering a copper funnel into the hole in the bottom. Later the gasolene supply pipe will connect to this. The tank, when finished, will have a shape that conforms to the general curve of the top of the body and should be set on top of the longerons and fastened securely a short distance in front of the pilot's cockpit.

The tail skid is made of spruce 3 feet long and 1" x 1½"; it is slightly rounded at the bottom and at a distance of 22" from the bottom is pivoted to the strut, which should be of ¾" steel tubing. Rubber strands are then fastened from the top of the skid to the top longerons at a point over the struts as shown. To keep the skid from standing upright by the pull of the rubbers, auxiliary strands are fastened to the bottom longerons.



The controls are next in line and should be made carefully, as the whole working of the machine depends on their correct design and construction. By studying the sketch the reader will see that the rudder is controlled by a foot bar, the tail flaps and the lateral control of the machine by the upright stick, which is free to move in any direction. This is accomplished by using two 1" steel tubes filled with wood to protect them from buckling and pivoted at the central point of the cross-tube, which fits into special sockets attached to each strut and 6" from the bottom of the upright tube. The pivot is a ¼" case-hardened steel machine bolt 2½" long. The wires to the elevator flaps fasten to the Hale in the flattened portion at the bottom end of the control stick, the wire to the lower horn of the aileron flap runs to, and around the pulley set at the rudder bar and under the seat to the flaps. The wire to the upper elevator horn is fastened to the end and runs directly back. The wires to the ailerons pass to the right and left to each aileron. How the controls work will be taken up later.

The pulley is turned out of aluminum and is 3" diameter. A trap is made which holds the pulley and should be so fastened to the beam that holds the rudder bar to enable the free movement of the pulley so as to allow it to follow the movement of the wires.

The rudder bar is made of ash and 22" from tip to tip. The pivot, a ⅜" case-hardened machine bolt, is set in the middle and a plate at top and bottom is attached to keep the bolt from enlarging the hole in the bar. At a point 6" out from this pivot, on each side of the bar, fasten a strap of .050 steel ⅝" wide to which the rudder wires are to be fastened. The pilot's feet set in a grooved portion at the ends, and I would advise attaching a piece of fabric or leather, in the form of a loop, to keep the pilot's feet from slipping off.

The landing chassis is built up of 3½ x 1" pieces of ash, the lengths being determined by the size of the wheels.

Twenty-inch wheels are shown in the drawing, as these are the most practical size for this type of machine, but of course a larger size can be used if smaller ones are not at hand. For instance, a light 26 x 3 or so.

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

Of Two Evils

Dr. Llewellyn Rainey, director of the Overseas War Library, was entertained at dinner by a group of Johns Hopkins students on the eve of his departure for the front.

A rich young sportsman, afflicted with swelled head, said to Dr. Rainey:

"I'm going to volunteer, Doc, but I can't decide whether to take up the cavalry or the aviation wing. Which do you advise?"

"The aviation, most decidedly," Dr. Rainey replied.

"Ah, you've seen me fly, have you?" he said.

"No," said Dr. Rainey; "I've seen you ride."—*Free Press.*

Ponder on This

A flea and fly got the "flu."
They said, "What shall we do?"
Said the fly, "Let us flee."
Said the flea, "Let us fly."
So they flew through a flaw in the flue

Stunts

I cannot do the old things now
  That I've been used to do;
I'm all smashed up from doing stunts,
  And so must keep from view.

In doing tailspins on the ground
  I lost my nerve for sport;
I am not good for anything—
  One leg's a trifle short.

In flying upside down one day
  I turned the wrong direction,
So to the hospital was sent
  For rest and for correction.

For flying at high altitudes
  My life is quite undone;
My pressure gage is smashed and bent,
  And I have lost a lung.

Up in a tree there hangs a wing
  And on the ground a wheel,
While on the struts there rests an arm
  That has no power to feel.

I lost a wishbone in the grass
  And broke a collar bone;
But these are trifles, so to speak,
  With what I got at home.

The major saw the ship and swore;
  In purple rage he said:
"We cannot have these ships mashed up,"
  While on the ground I bled.

In kindness keep my girl away,
  Nor even send a rose;
I haven't any sense of smell—
  I've lost my only nose.

Please tell the folks at home I'm dead
  And send to them my pension.
And you, cadets, take heed to this
  And through me learn prevention.

F. Milton Weeks, *Cadet.*

Lazy Lines

(By Lynn)

That guy who
Wrote "I
Don't Want
To Get Well."
Here I lay
All sewed-up
Like a Red
Cross sock
That's been
Thru a French
Laundry & a
Cadet and some
Lute, sewed-up,
Too, are
Discussing
How they were
Reopened to

Have a magneto
And a cylin-
Der head
Removed which
They reckon
The Doc forgot
& as I lay
Here wet
With sweat
That golden-
Barred Lieutenant
Sticks his
Head in
& asks me
Kindly:
"Have yo' all
Saw my
Trench helmit?"

The Young Idea

The quizzes at ground schools frequently bring forth remarkable gems of logic, and through the courtesy of one of the professors at a ground school somewhere in America we are enabled to present a few this week:

"When a propeller is not in dynamic balance it warbles."

"The lamentations of a propeller make it stronger and keep it from warping."

"The B. T. U. is a heat unit used by the British."

"Lilienthal had camber."

"A B. T. U. is the power required to make an airplane fly."

"Shock absorbers are made of cast iron."

"Rantoul was the first man to use an open fuselage."

"Chanute discovered the angle of incidence."

"Sock absorbers should have the same tension."

Consoling to Some of the Married

One thing about war: The wifie back home knows hubby is somewhere in France. That's more than she usta know half the time.

(*Continued from page* 817)

ible scarff ring for mounting twin Lewis machine guns is placed around the cockpit. A very wide arc of fire is provided for the gunner, and an unobstructed view is obtained by both pilot and gunner.

The engine is located aft of the pilot, between the upper and lower planes. It drives a ring surrounding the fuselage, to which the four-bladed propeller is attached.

This construction is unique in that it permits the advantages of an enclosed fuselage usually employed in tractor machines, while the screw is placed in pusher position, permitting an advantageous placing of occupants and engine.

Planes are flat in span and similar in plan, but ailerons are placed on the upper plane only. Planes have a moderate stagger and a pronounced sweepback.

The center section of the upper plane contains a 38 gallon fuel tank with a supply pipe running straight down to the engine below it.

A 75-gallon fuel tank is placed in the main float at the center of gravity. The fuel system employs twin wind-mill pumps with overflow return.

Two radiators are located in the center section at either side of the gravity fuel tank. They are set into and conform in outline to the wing section.

Central pontoon or main float is built up of mahogany. It has 16 water-tight bulkheads or comparments. The two wing tip floats each have five compartments.

For the bracing between planes, and for the floats, special streamlined stays are used. Throughout the entire construction fittings are of aluminum bronze, which makes them proof against corrosion. Struts and spars are of steel tubing.

ORDER IN ADVANCE

The acceptance of unsold copies of AERIAL AGE has been discontinued by direction of the War Industries Board.

To be in touch with aeronautics no one will want to miss a single issue of AERIAL AGE. Insure against disappointment. Place a standing order with your newsdealer or subscribe. $4.00 a year.

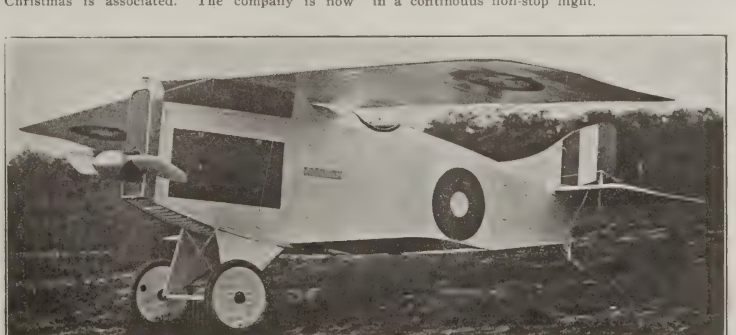
Christmas "Bullet" Tested



Remarkable speed was shown at the test of the Christmas "Bullet" which is reported to have made a speed of 170 miles an hour with the engine at three-quarter throttle. The machine has a Liberty "6" which is rated at 185 h.p. at 1,400 r.p.m.

The "Bullet" was tested at Government Experimental Field No. 1 (near Central Park, L. I.), on Tuesday, December 3 and December 7, before Col. Harmon and his staff. Although a forty-mile wind was blowing, making flying very difficult, the machine was flown by Cuthbert Mills very close to the ground so that the spectators could observe its action.

This machine is the first successful design to positively employ no brace wires or struts between the planes. The upper wing has a span of 28 feet and a chord of 5 feet. The lower plane is 12 feet in span with a chord of 2½ feet. The wings are flexible and during flight they bow, giving them the appearance of birds' wings. The trailing edge is flexible also and as the speed of the machine increases, the wing flattens. In encountering shocks in the air and in combatting severe winds, the flexibility of the wings makes the machine less subject to the racking effect which results in rigid machines.

Doctor William Whitney Christmas, inventor and designer of the Christmas "Bullet," is anxious to compete with any manufacturer in a race from New York to Washington at any time. Although Dr. Christmas' machine has a 180 h.p. engine; he will race it against any other machine in the country or if no competitors can be found, the machine will be raced against time, and it is expected to establish a record for speed between this city and the national capitol. Not only has this machine speed, but it is capable also of performing stunts of every description and in this respect also the designer invites comparison in actual competition

Mr. Alfred E. F. McCorry, General Manager and Treasurer of the Cantilever Aero Company, 1269 Broadway, New York City, N. Y., is the representative for the company with which Dr. Christmas is associated. The company is now making plans for the construction of a Trans-Atlantic Aeroplane with a 180-foot spread, giving 5,000 square feet of surface. This machine is to be equipped with four engines of 750 h.p. each. A land model is to be used, and although representatives of the company concede that the flight across the Atlantic may be made before their machine is completed, they nevertheless expect to be the first to make the trip across in a continouus non-stop flight.

The Christmas "Bullet," the first successful "strutless" biplane, for which a speed of 170 miles an hour is claimed

$1,000 CURTISS MARINE FLYING TROPHY PRIZE WON BY MARINE CORPS

THE competition for the Curtiss Marine Flying Trophy and the $1,000.00 cash prize ended on December 31st, 1918, with Lieutenant T. C. Rodman, U. S. Marine Corps, as the winner of the prize and the Aero Club of America as the winner of the Trophy.

Lieutenant Rodman won the trophy with a flight of 900 miles, made with a large H-16 type Curtiss Flying Boat at Pensacola, Florida.

Another flight was made by the veteran naval aviator, Lieutenant-Commander P. N. L. Bellinger, U. S. N., who covered a distance of 651 miles without stopping, with five passengers besides himself. He made the flight in 9 hours and one minute.

Both flights were in competition for the Curtiss Marine Flying Trophy and the $1,000 cash prize, which ended on December 31st, 1918, with Lieutenant T. C. Rodman, U. S. M. C., as the winner of the prize, and the Aero Club of America as the winner of the Trophy.

Lieutenant Rodman won the Trophy with a flight of over 900 miles, including the 5 per cent increase for each of the eleven passengers which he carried. It was made with a large H-16 type Curtiss Flying Boat, at Pensacola, Florida. Commander Bellinger covered close to 850 miles. Had he carried additional passengers instead of carrying dead weight he would have had a larger mileage even than Lieutenant Rodman.

The following aviators competed for the Trophy:

1. Stewart W. Cogswell, flying an Aeromarine plane, equipped with 130 H.P. Aeromarine motor, at Keyport, New York, representing the Aero Club of America.

2. Lieutenant Thomas Clifford Rodman, U. S. Naval Air Station, Pensacola, Florida, flying a H-16 U. S. N. Curtiss type Flying Boat, equipped with two Liberty motors, representing the Aero Club of America.

3. Lieutenant Fitz William Dalrymple, Jr., U. S. Naval Air Station, Miami, Florida, flying a H. S. 2 Curtiss Flying Boat, equipped with two Liberty motors, representing the Aero Club of America.

4. Lieutenant G. B. Newman, U. S. M. C. R., Miami Flying Field, Miami, Florida, flying a Hydro-aeroplane JN4H, converted to a hydro-aeroplane by removal of landing gear and substituting an N9 Pontoon, equipped with a Hispano-Suiza 150 H.P. motor, representing the Aero Club of America.

5. Lieutenant Douglas Manning, U. S. M. C., Miami Flying Field, Miami, Florida, flying a H. S. 2 Curtiss Flying Boat, equipped with two Liberty motors, representing the Aero Club of America.

6. Lieutenant-Commander P. N. L. Bellinger, U. S. N., flying a Curtiss Flying Boat, equipped with Liberty Motors, representing the Aero Club of America.

The report of other entries and judges will be given in the next number of AERIAL AGE.

The complete reports of all the flights made for the trophy will not be available for a few days owing to the number of flights made at the different Naval and Marine Stations and elsewhere on the last day of the race and the closeness of the records, but it seems final from the reports that Lieutenant Rodman is the winner.

The telegraphic report of Lieutenant (J.G.) E. L. Mitchell, U. S. N., who acted as judge with Ensigns R. A. Talbot and M. S. Martin, at Pensacola, states that Lieutenant Rodman started at 6.50 A.M. on December 30th with eleven passengers. Landed at two minutes past four o'clock P.M., having covered a distance of 581 nautical miles, having made one landing to get gasolene.

Under the rules there is a penalty of five per cent for each landing and an increase of five per cent for each passenger carried. While the exact total will not be known until the detailed report of the judges are received, the estimates show that Lieutenant Rodman is entitled to a distance of over 900 miles.

The first flight for the Curtiss Marine Flying Trophy for 1918 was made on October 25th. Stewart W. Cogswell competed for the trophy, using an Aeromarine seaplane, with 130 H.P. Aeromarine motor. Mr. Cogswell flew over a course of 15 miles between Keyport, N. J., and Coney Island, L. I., and made a total distance of 540 miles in the actual flying time of 7 hours and 59 minutes, making 36 laps. From the total mileage a penalty of 5 per cent is deducted on account of flying over a broken course, and an added penalty of 10 per cent is deducted on account of two stops, leaving the net distance 459 miles, made at an average speed of 68.40 miles per hour. The fastest lap was made in 24¼ minutes, or at the rate of 76.50 miles per hour, and the two stops were made for fuel. A cross wind was blowing which increased materially just before noon. The official observers were Ensign Edward E. Jeffries, U. S. N., and Mr. T. W. Post.

Under the rules, the $1,000.00 cash prize that goes with the Curtiss Trophy for 1918 goes to the winning pilot, who must be a member of the Aero Club of America or an Aero Club affiliated with it, and he becomes the record holder of the trophy, which is to be held in custody by the Aero Club of America. A Club becomes the owner of the Trophy after the fifth year if it has been won for three consecutive years by its members. As a member of the Aero Club of America has won this Trophy three times in succession, it will become the permanent holder. The winners were: In 1915, Oscar A. Brindley, 443.72 miles; in 1916, Victor Carlstrom, 661.44 miles; in 1917, Caleb Bragg, 296.92 miles.

PRIZE OFFERED FOR PARACHUTE COMPETITION

TO BRING about the development of a parachute which will be to the aviators and air travellers what the life preserver is to sea travellers, Mrs. Louis Bennett has offered to the Aero Club of America $500.00 to be awarded as a prize or prizes to be awarded in a parachute competition.

Mrs. Bennett's son, Lieutenant Louis Bennett, R. A. F., who was a member of the Aero Club of America, lost his life in an air fight at the front; and Mrs. Bennett, believing that her boy's life, like the lives of many other aviators, including Major Lufbery, could have been saved had they had a parachute, wishes to do everything in her power to develop such a parachute.

The Executive Committee of the Aero Club of America has accepted the offer, and Mr. Alan R. Hawley, the Presi-

dent of the Club, has appointed the following committee of experts, members of the Club, to draw the rules and regulations for the contest.

Major Thomas S. Baldwin, U. S. A., the veteran aeronaut, who made his first parachute jump in 1885 and has made hundreds of parachute jumps from balloons;

A. Leo Stevens, another veteran aeronaut, also one of the U. S. Army experts, who was one of the first to arrange for parachute descents from aeroplanes, at the time when the speed of aeroplanes was only from 35 to 50 miles per hour;

Colonel A. L. Fuller, in charge of the Balloon Section, U. S. Army;

Colonel Henry B. Hersey, U. S. Army, another veteran expert, who made parachute descents from kite balloons at Omaha in the Summer of 1917;

Colonel James Prentice, U. S. A., veteran balloonist.

Lieutenant Colonel Wm. Thaw, the dean of the Lafayette Escadrille aviators, who has had extensive experience at the front;

Major Cushman A. Rice, U. S. A., who also has had extensive experience with aeroplanes at the front;

Congressman F. La Guardia, who until recently was Major in the U. S. Army in Italy and flew in the large Caproni aeroplanes;

Major R. W. Schroeder, the holder of the world's altitude record of 28,900 feet;

Rear Admiral Mark L. Bristol, U. S. N., former Director of Naval Aeronautics;

Commander Henry C. Mustin, U. S. N., veteran naval aviator;

Commander John H. Towers, U. S. N.

Lieutenant Commander P. N. L. Bellinger, U. S. N.,

Lieutenant Godfrey L. Cabot, U. S. N.,

Lieutenant R. A. D. Preston, U. S. N.,

Ensign Raffe Emerson, U. S. A.

All the officers who have had a number of years of experience in aeronautics; and Henry Woodhouse, Frank S. Lahm, and Augustus Post, who have given years to the study of the different branches of the service and are familiar with the different problems.

This committee was selected with due consideration of the fact that the problems are many sided and that besides securing an efficient parachute it is necessary to find the safe methods of attaching the parachute to the aeroplanes, and that the methods may have to be different for large aeroplanes or small aeroplanes and land machines and seaplanes.

If the competition shows that efficient parachutes are to be had, and fool proof methods of using it are decided upon, it is expected that carrying parachutes on aeroplanes will be made compulsory, just as it is compulsory to carry life preservers on board of vessels at sea.

It is the belief of the Aero Club authorities that this competition will be extensive, because a large number of parachutes have been evolved during the war. It is known that the Goodyear Company and Lawrence B. Sperry have two excellent parachutes. Lawrence B. Sperry tried his from a fast aeroplane and the first test was successful. A number of other types of aeroplanes were given preliminary tests by the Army and Navy. The competiton will be international in character and will afford a thorough test for every kind of parachute.

The most important problems to be solved are defined by Mr. Henry Woodhouse as follows:

"The main problems which remain to be solved," said Mr. Woodhouse, "are the problems connected with the use of the parachute in flying aeroplanes. Some of these problems are as follows:

"(1) To find the best way to attach a parachute to an aeroplane or to the aviator, so that it can be operated whether the aeroplane is at an even keel, or climbing, or diving, or side-slipping, or upside down.

"(2) It must be membered that when a plane is travelling at a speed of from 90 to 150 miles an hour—and there are machines going even faster—the pilot only has seconds in which to think and act, therefore, the parachute attachment must be simple and must work instantly.

"(3) The parachute may be fastened to the back of the pilot himself, or to the aeroplane, on the fuselage, back of the pilot; or under or to the side of the fuselage, or at the trailing edge of the lower panel of the wing, or to the seat of the aeroplane. But it must be remembered that the pilot is fastened to his seat by a safety belt which he must unfasten before the parachute is opened, else he will have the unpleasant experience of having the parachute pull the upper half of his body in the opposite direction from which he is travelling. The parachute would eventually collapse, but so would the aviator.

"(4) Having found the best method of attaching the parachute, the next important thing is to have a parachute that opens quickly, does not drop too fast and does not oscillate overmuch while descending. The average parachute opens in about a 150 foot drop, then descends at a speed of about 20 feet a second.

"(5) A parachute need not be heavy to be safe, and weight is objected to in aeroplanes because it decreases the useful load of the plane. A parachute of Japanese silk, about 18 feet in diameter, capable of sustaining a man weighing 150 pounds, will not weigh more than 15 pounds. The fear on the part of aviators that a parachute would weigh 40 or 50 pounds is one of the factors which has retarded the adoption of the parachute as a life saver. A large parachute is bad because it oscillates and slides sideways after it oscillates. On the other hand, a too small parachute will travel down too fast.

"(6) Such pioneers as Thomas S. Baldwin and A. Leo Stevens found by practice that they could, to some extent, control the direction of the fall of the parachute by pulling the ropes on any one side of the parachute, forming a sail of that side of the parachute, so that it would result in the wind carrying the parachute in a given direction. They also found that if they were travelling in a current which was taking them away from the desired landing place, they could pull the ropes on two sides of the parachute, and by decreasing the span of the parachute they caused it to drop faster, thereby getting out of that air current which was taking them in the wrong direction.

"(7) Another important thing which must be given attention is the harness which connects the pilot to the parachute while he is descending. With a good harness the pilot will feel fairly comfortable while descending, and he can detach himself immediately upon touching the ground, so as not to be dragged over the ground by the parachute in the event of there being a strong wind close to the ground."

Besides saving the lives of aviators and air travellers in case of accident, it is expected that parachutes will be used extensively in future to drop mail and packages from aerial mail planes at stations where the planes do not land to get mail.

Towards the close of the war parachutes were used by the Allies to supply ammunition to infantry and machine gunners on the front line, who were cut off from the rest of the fighting forces by German barrage fire. Boxes of ammunition were attached to parachutes, which were dropped over the fighting infantry and machine gunners, who were then enabled to proceed with advances and take important positions which could not have been done otherwise.

CAPTAIN BARTLETT'S ARCTIC EXPEDITION

THE report that a British party commanded by Captain Wild is to start for the North Pole in April, by way of Spitzbergen, was welcomed at the Aero Club of America today by Captain Robert Bartlett, Mr. Alan R. Hawley, president of the Club; Read-Admiral Bradley A. Fiske, Henry Woodhouse, Augustus Post, Major Cushman A. Rice, U. S. A., John Hays Hammond, Jr., Henry A. Wise Wood and Charles Jerome Edwards.

"As there is over one million miles of unexplored regions, there is room for a dozen expeditions," said Captain Bartlett, who is to command the American expedition, being sent out under the auspices of the Aero Club of America.

"As Spitzbergen is many hundred miles from Cape Columbia, where our aeroplane base is to be established," said Captain Bartlett, "it is very likely that the two expeditions would not meet or see each other, unless they went out of their way to meet, which we would be likely to do, because while we explorers like competition, we are also interested in each other's success and will go out of our way to help each other.

"American and British aviators worked together to conquer the Germans; it is quite logical that they should work together to conquer the Arctic from the air."

Mr. Hawley pointed out that the despatch does not state whether Captain Wild's expedition will undertake to do more than to explore part of the Arctic regions.

Capt. Bartlett's expedition has three important missions, as follows:

(1) To fly across the top of the world from Cape Columbia on the American side to Cape Chelyuskin on the Siberian side;

(2) To conduct extensive soundings in the Polar Basin and make a map of the floors of the Polar Basin and collect flora and fauna from the ocean bottom.

(*Continued on page* 872)

THE NEWS OF THE WEEK

Aeronautic Exposition to be Held in Madison Square Garden in February

An aeronautic exposition under the auspices of the Manufacturers' Aircraft Association will be held in Madison Square Garden, February 27 to March 6, inclusive.

Arrangements for this show were begun some weeks ago, but were delayed by a peculiar situation which developed in Washington, as a result of precautions taken to protect the country during the great war. On January 1, 1918, a proclamation was issued by President Wilson prohibiting the holding of any aeronautical exposition during the period of the war.

A few weeks ago the Manufacturers' Aircraft Association took up with the War Department the matter of co-operation and display, especially with regard to war trophies and certain military features. The War Department manifested a willingness to do all it could, but immediately discovered that the proclamation might stand in the way of complete co-operation. The puzzle was put up to the Judge Advocate General. It was suggested that the President himself in his speech to Congress, November 11, in which he said "The war thus comes to an end," had provided a literal abrogation of the old proclamation. Officers felt, however, that it would be better not to establish any precedent. But by the time the matter was brought to the White House, the President had gone abroad.

The State Department was appealed to with the result that the whole subject was cabled to Paris. In the meantime the State Department prepared a new proclamation rescinding the old order and in due time received authorization as shown in the following statement which was issued at Washington, Dec. 20:

"At the request of the Secretary of War, the President has authorized the issuance of a proclamation revoking the proclamation of last January, prohibiting the exhibition of aircraft during the period of the war. Pending the formal signing of the new proclamation the Secretary of State has requested the Attorney-General not to prosecute any infringement of the earlier proclamation."

Col. Mars Heads Aircraft Production

Washington.—Lieutenant Colonel J. A. Mars has been appointed director of the Bureau of Aircraft Production, taking the place of W. G. Potter, who has resigned as was previously announced. Colonel Mars is a regular army officer.

Bids Asked for Service Equipment

The Salvage Branch of the Supply Section of the Department of Military Aeronautics has invited sealed bids for the following material:

1,000 Standard J-1 aeroplanes, equipped with Curtiss OX5-90 engines, at Houston, Tex.

200 Standard J-1 aeroplanes with Hispano-Suiza 150 h.p. engines, at Houston, Tex.

Standard J-1 aeroplanes, without engines, Houston, Tex.

10 L. W. F. aeroplanes, with Thomas 135 h.p. engines, at St. Paul, Minn.

2,000 A-7-A four-cylinder Hall-Scott engines at Houston, Tex.

The bids for the above materials will be opened at 11 A. M. on February 1, 1919, at the office of the Salvage Branch, Washington, D. C. Each bid must be submitted in duplicate and accompanied by a certified check for 20 per cent of the amount of the bid. The Government will receive proposals for any item or any quantity subject to the usual reservations. The terms of all sales will be cash, f.o.b. location given, and delivery must be made within ninety days.

No More Civilian Flying Instructors

Under date of December 11 the following information and instructions were telegraphed by the Director of Military Aeronautics to all commanding officers of flying fields, aviation repair depots and acceptance parks:

"The Secretary of War has abolished position civilian flying instructor, effective December 31, 1918. On or before December 31, discharge without prejudice all such, quoting authority Secretary of War, first indorsement December 6, and this telegram. You may grant leave up to and including December 31, provided total leave granted does not exceed thirty days current calendar year. Report by letter names those discharged with dates."

Consolidation of Various A. S. Branches

Announcement is made of the transfer of the Traffic and Storage Branch of the Bureau of Aircraft Production to the Division of Military Aeronautics, and of its consolidation with the Traffic and Storage Branch, Supply Section,

Major-General Charles T. Menohar, who is now en route from France to fill his new appointment as Director of the Air Service. General Menohar commanded the Rainbow Division in France

D. M. A., of which Col. Clinton G. Edgar is chief.

The seven aircraft production depots operated by the Traffic and Storage Branch, B. A. P., are affected by this transfer. These are located at Detroit, Mich.; Buffalo, N. Y.; Dayton, Ohio; Elizabeth, N. J.; Washington, D. C.; and San Francisco and Sacramento, Cal. The two latter named depots have been closed and the others will hereafter be designated as aviation general supply depots. Other storage arrangements include the following:

To the Aviation General Supply Depot (formerly the Aircraft Production Depot) at Tenth and B streets southwest, Washington, D. C., nel at the Washington Aviation General Supply have been transferred all the stock and person-Depot, 1422 First street northeast, which has been vacated.

The Aircraft Production Supply Officer, who was stationed at Port Newark, N. J., has been eliminated and his work taken over by the Aviation Officer, Port of Embarkation, New York City.

This transfer also involves changes on the traffic side. Traffic offices were maintained by the Bureau of Aircraft Production at New York City, Elizabeth, N. J.; Buffalo, N. Y.; Elyria and Dayton, Ohio; Detroit, Mich.; Chicago, Ill.; Jacksonville, Fla.; and San Francisco, Cal., as well as a main office at Portland, Ore., and several branch offices in different lumber districts in connection with aeroplane spruce production. As a result of the consolidation the Chicago, Elyria and San Francisco offices have been closed, and the New York and Detroit offices consolidated with the traffic offices maintained in those cities by the Division of Military Aeronautics. The traffic office of the division at Pittsburgh is retained.

All activities of the Spruce Production Division of the Bureau of Aircraft Production have been discontinued.

Intended for eventual transfer to the Division of Military Aeronautics are the whole of the Aeroplane Engineering Division (including Production Engineering, Experimental Engineering and Design), McCook Field, and also the Technical Information Department of the Bureau of Aircraft Production.

In this connection it is also announced that Erie Warehouse No. 2, maintained at Jersey City, N. J., by the Division of Military Aeronautics for the consolidation of overseas shipments, has been closed and that functions of Radio and Photograph Warehouse No. 1, New York City, are being assumed by the Aviation General Supply Depot at Fairfield, Ohio.

It is pointed out that this consolidation and redistribution of functions and the discontinuance of former offices of both the bureau and division make for reduction of expense of operation and economy of administration.

First Trans-Continental Flight

The squadron of four army training planes flying from San Diego, Cal., reached the Atlantic Coast on December 22. This flight in formation approximates 2,400 miles. The planes left the Pacific Coast December 4 and they have come east across the continent in short flights limited by the size of their gasoline tanks, none of the

A recent photograph of Lt. Meisner and Eddie Rickenbacker, American "Aces", who were awarded Distinguished Service Crosses for bravery

planes carrying more than an hour and a half's supply at any one time. The crews, two men to a plane, have gathered data and statistics on landing fields, also made air maps of the route along which they came.

This work is a part of the big reconnaissance now being made by fliers going out in all directions from over twenty-five fields in various parts of the country. The material collected, as fast as it is returned to the fields, is being forwarded to Washington for analysis and compiling in the form of a government air guide or blue book. Major Albert D. Smith, commanding the air squadron which has come east from the Pacific, reported on December 23, to the Division of Military Aeronautics in Washington, D. C., that his planes left Americus, Ga., at 9 A.M., December 22, and arrived at Jacksonville, Fla., at noon, having encountered rain and fog all the way and at no time having a ceiling of more than 500 feet. Major Smith expects to fly his squadron north to Washington at an early date.

Personnel Board

A board of officers as named below is constituted to consider such matters affecting the personnel of the Air Service as may be brought before it:

Colonel Archie Miller, A. S. A.
Colonel M. F. Davis, A. S. A.
Colonel William E. Gillmore, A. S. A.
Colonel Henry C. Pratt, J. M. A., A. S. A.
Lieut.-Colonel Rush B. Lincoln, A. S. A.
Lieut.-Colonel B. F. Castle, J. M. A., A. S. A.
Lieut.-Colonel M. F. Harmon, J. M. A., A. S. A.
Lieut.-Colonel H. Benington, A. S. A.

Morrow Field

The following letter from the Adjutant General designates the field at Detroit as Morrow Field:

"You are informed that the Air Service Acceptance Park at Detroit, Mich., will be officially known as Morrow Field, in honor of Lieutenant Karl Clifford Morrow, who lost his life in Detroit, Mich., November 11, 1918, while entertaining citizens of the city who were celebrating the signing of the armistice.

(Signed) RALPH HARRISON,
Adjutant General."

Four Noted Aces Quietly Return

Philadelphia.—Major C. J. Biddle, of this city, one of the famous aces of the American Air Service, surprised his relatives by reaching home without previous announcement on December 21. He was accompanied from France by Lieutenant Colonel William Thaw, of Pittsburgh; Captain Edgar E. Tobin, of San Antonio, and Captain Roy C. Bridgman, of Lake Forest, Ill.

U. S. Airmen Downed 854 Enemy Planes

Washington. — American airmen in France brought down a total of 854 German aeroplanes and 82 German balloons, against an American loss of 271 planes and 45 balloons, according to a report cabled by Major General Harbord, made public on December 22 by the War Department. Destruction of 354 of the enemy planes and 57 of the balloons had been officially confirmed.

The total casualties of the American Air Service in action are given as 442, including 109 killed, 103 wounded, 200 missing, 27 prisoners and 3 interned.

When the armistice ended the fighting, the report said, there were 39 American aero squadrons at the front. They included 20 pursuit, 6 day and 1 night bombardment squadrons and 5 army, 12 corps and 1 night observation squadrons. The total personnel was 2,161 officers and 22,351 men at the front, with an additional 4,643 officers and 28,353 men in the service of supply.

Col. Thurman Harris Bane, one of the few J. M. A.'s in the army who is in charge of the Technical Section, Department of Military Aeronautics

Eight American flying officers were detailed with the British army and 49 officers and 525 men with the French forces.

The total strength of the American Air Service in France was 58,090, of whom 6,861 were officers. This was exclusive of the air service mechanics' regiment with the French army, numbering 109 officers and 4,744 men. In addition to these trained men, the air service had eight separate schools in France, where 1,323 pilots and 2,012 observers were under instruction, and graduations up to November 11 included 6,069 pilots and 2,045 observers.

Up to November 16 General Harbord reported, 6,472 planes of all types had been received by the American Air Service in France, including 3,337 pursuit planes for combat work and ninety for schools; 3,421 observation for service and 664 for schools, 421 day bombers, with eighty-five additional for schools, and thirty-one night reconnaissance machines. There were in addition 2,285 training, thirty experimental and 108 miscellaneous machines.

The eight American air schools in France had a capacity for training 3,800 officers and 11,700 men. The largest was the general flying school at Issoudun, where 2,175 officers and 6,100 men could be cared for. The others were at Tours and Chatillon-sur-Seine for observers, at Maucon and Coetquidan and Souge for artillery fire spotters, at St. Jean de Monte for aerial gunnery and at Clermont-Ferrand for bombers.

Lieut. O'Brian Hopes to Make Trans-Atlantic Flight

Kankakee, Ill.—Lieut. Patrick O'Brian, American aviator in British service, whose escape from German captors formed a romantic chapter in the story of the war, announced that he will attempt to be the first to make a Trans-Atlantic flight in an aeroplane. He hoped to make the flight in April.

Capt. I. F. Fuller, an American aviator still on duty in France, and Lieut. C. C. Robinson, an American who was one of O'Brian's comrades in the British Flying Corps, will be associated with him in the venture.

Goodyear Balloon S-11 Makes Record

Balloon S-11, from Wingfoot Lake, recently completed a remarkable trip from the local flying field to Wheatley, Ontario, Canada.

The balloon, piloted by a former Goodyear man, Walter W. Morton, was the third and smallest balloon to make the trip over Lake Erie, a distance of 140 miles.

The trip was completed in two hours and fifteen minutes and the height of 1,500 feet maintained throughout.

Morton was accompanied by C. O. Brown and R. S. Stebbins of the Naval Aviation Service.

Morton was formerly connected with the Balloon Department here, and has been interested in this branch of flying for a number of years.

Rodman Wanamaker Now Colonel

Rodman Wanamaker, Special Deputy Police Commissioner, is now a Colonel on the staff of Governor Alfred E. Smith. His name was one of four announced for the staff by Mr. Smith, the others being Capt. Tracy Hammond Lewis of Great Neck, L. I., a son of William E. Lewis, editor of the *Morning Telegraph;* Lieut. Joseph F. Sabine Meecham of Syracuse and Lieut. Ernest E. Malcomb of this city.

Col. Wanamaker is credited to the infantry branch of the service. Capt. Lewis has just returned from Fort Sill, where he was an instructor in the balloon branch of the army. Lieut. Meecham has been in the Quartermaster's Department and Lieut. Malcomb was an aide to Brig.-Gen. George R. Dyer.

Air Service Detachments Ordered Home

Fourteen Air Service units of different branches of the service have been assigned early convoy back to the United States, according to a statement issued by the War Department on December 26.

The 19th, 30th, 23d, 20th, 36th, 35th and 45th Balloon Companies are listed to sail for the United States shortly.

Aero Squadrons numbers 19, 1099, 466, 480, 481, and 493 have received their embarkation orders. The 6th company of the 2d Air Service Mechanics regiment has also received its convoy assignment.

"Hobey" Baker Dead

Paris.—Hobey Baker, the famous Princeton hockey star and an aviator in the American army, was accidentally killed while flying on December 21.

The fatal flight was the last Baker was to have made before leaving for the United States, papers ordering the airman to return to America being found in his packet when his body was picked up.

Baker will be buried in France, beside two other famous American aviators—Lufberry and Putnam.

H. A. H. ("Hobey") Baker was famous in eastern amateur and college athletic circles for his football and hockey playing. He easily made the Princeton 'varsity eleven, and was a member of the backfield from 1911 to 1913, as well as captain of the team in his senior year. He was also captain and a prominent factor in many of the victories of the Princeton hockey team.

Line of Zeppelins to America Planned

Paris, Dec. 26, (Havas.)—Disarmed German Zeppelins will be converted into aerial merchantmen to ply between New York and Hamburg, according to the *Echo de Paris*, which says that it has received its information from "reliable sources."

Alan R. Hawley, President of the Aero Club of America, considers the announced project for converting Zeppelins into merchant carriers to be both feasible and practical.

"We have been reliably informed that large super-Zeppelin type, rigid dirigibles have been constructed which will contain 3,000,000 cubic feet of gas, and have five motors and a length approximately 800 feet," said Mr. Hawley. "These Zeppelins can remain in the air for two weeks without appreciable loss of gas, and can make seventy to eighty miles an hour.

"It has been reported that Zeppelins flew from Jamboli in Bulgaria to Khartum in the Soudan and return, a distance of more than 3,000 miles, carrying a crew of twenty-two men and twenty-five tons of munitions and medicine, intended for the relief of General Lettow-Vorbeck in German East Africa. When over Khartum a wireless was received by the commander of the dirigible that the German officer had been captured, and it turned back without landing."

U. S. Dirigible Sets Record

New York.—What is declared to be a new world's record endurance flight in a non-rigid dirigible balloon—32 hours before a landing was made—will be submitted by the United States naval air station at Key West, Fla., to the Aero Club of American for homologation. Before it can be officially recognized as a record it must be so declared by the Aero Club of America, it was explained, under the rules of the International Aeronautic Federation, of which the American organization is a member.

The flight claimed as a record was made on November 23 by Ensign Thomas E. Haytham, of Buffalo, N. Y., accompanied by Ensign Tulford B. Null, of Denver, Colo., and J. H. Collier. The airship carried a full load, consisting of radio apparatus, anchors, rations and other necessary accessories. The motor was run continuously at cruising speed, and about 600 miles had been flown before a leak and a threatening storm compelled a landing.

Frank H. Russell, president of the Manufacturers' Aircraft Association, who has just been appointed General Manager of the Curtiss Engineering Corporation at Garden City

Cato With Marlin-Rockwell Corporation

J. L. Cato, experimental engineer at the plant of L. W. F. Engineering Company, who developed the L. W. F. Model "G" has resigned to develop for the Marlin-Rockwell Corporation a new all ball bearing aeronautical motor, which later will power a sporting type of monoplane of his own design. Mr. Cato has been connected with aeronautical work since 1909, and with his long experience he should bring out a popular type of sporting plane.

Browning Gun Perfected

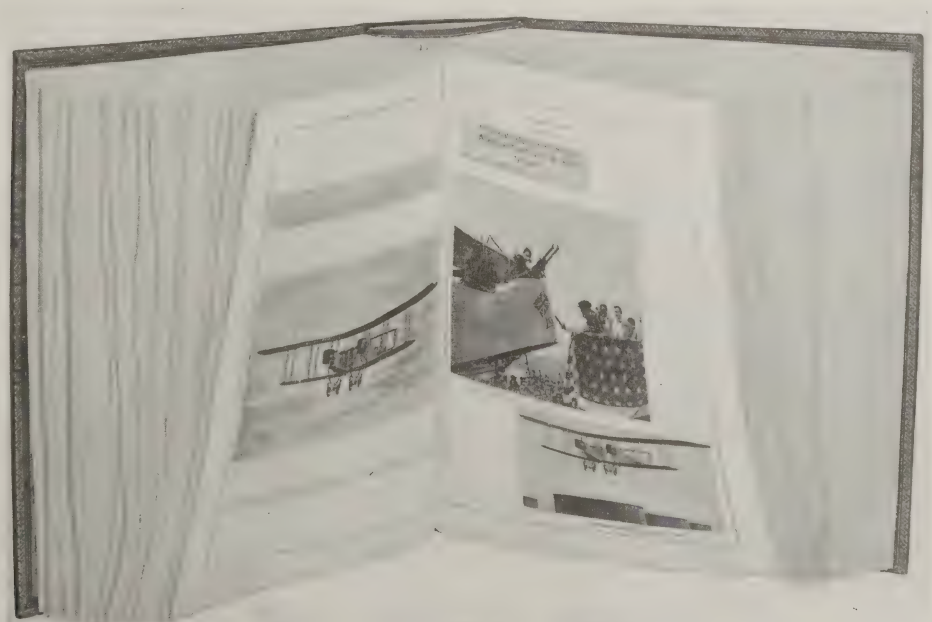
Ogden, Utah.—Perfection by John M. Browning of machine guns for aeroplanes so that a flier can, by pressing one trigger, fire three machine guns simultaneously, shooting 3,600 shots a minute at the same target, was announced Dec. 20 upon the return of the inventor from the east.

Uses Parachute in Leap from Plane

Dayton.—Test of a parachute equipment as a protection in air navigation was made at the Wilbur Wright aviation field here December 20 with Rodman Law in the stellar role. He has been experimenting for six weeks along this line using sand bags attached to a parachute to demonstrate how an aviator may jump from a crippled aeroplane and land safely. The parachute weighs 12 pounds and is made of Japanese silk. Army officials watched the first test in which Law leaped from the aeroplane with the parachute.

Aerial Transport Co. In Canada

Aeroplanes are to supplant ferryboats in transporting passengers from Prince Edward Island to the mainland, it has been announced by Major Kennedy, of the Aircraft Manufacturing Company. The Prince Edward Island Aerial Transportation Company has been formed with a capital of $250,000 to carry on the new service.



"The aeroplane flight between Charlottetown, on Prince Edward Island, to Montreal, on the mainland, a distance of about 100 miles, will be made in an hour and a quarter," said Major Kennedy. "The West Indies Aerial Transport Syndicate is already operating one plane between all the islands of the West Indies."

Air Fete Over Fleet In Hudson

New York, Dec. 27.—Fifteen large seaplanes and two dirigibles from the naval air station at Rockaway manned by members of the naval air service left Rockaway station shortly before 9 o'clock, flew over the lower bay and circled over the fleet now anchored in the Hudson. The first half dozen were in battle formation, the others flying singly. This is the air squadron that was to meet the fleet Thursday, December 26, but as a result of unfavorable weather conditions, it did not take part in the ceremonies.

After the squadron had circled over the fleet at its farthest northern point, it flew back and forth over the Hudson all the morning.

One of the vessels, the U. S. S. Texas, carries 3 aeroplanes, 2 Sopwiths and a French bombing plane which were taken aboard at Brest, France.

This book was presented to President Mingle of the Standard Aircraft Corporation. It is a complete photographic and written record of "Langley Day" when the first American built Handley Page was launched at Elizabeth, N. J., in July

Boston to Chicago Air Mail Is Next

Washington.—The establishment of an air mail route from Boston to Chicago, with stops at Albany and Buffalo, will be accomplished by the Post Office Department early next summer. Second Assistant Postmaster-General Praeger has determined that the establishment of this important line from the lakes to the coast shall be the next development.

Flying from Boston to Albany represents an air line of 200 miles. The next step of the journey adds practically 300 miles. From Buffalo to Chicago the air line distance is slightly less than 400 miles.

The rate of postage by air mail will be the same as for the established daily service between Washington and New York. The rate as now fixed will remain until the working out of the general use of the system has developed to a point where a reduction is justified.

Mr. Praeger expects that when the Boston-Chicago line is established the actual flying time will be inside an eleven hour limit, inclusive of the two stops.

Aero Mail in Belgium

Aerial mail service for government correspondence has been established in Belgium, according to advice received from Brussels.

Chart New York-Cleveland-Chicago Aero Mail Route

Cleveland, O.—The four aeroplanes which left New York December 28 are not expected to reach Cleveland before December 31. The machines have been flying leisurely in order to chart all possible landing fields between New York and Cleveland.

"Cleveland's aero mail will leave on time January 2, rain, shine or snow, and regardless of whether the mail planes from Chicago and New York reach here on time or not," John A. Jordan, aero mail supervisor, said.

"We will have five aeroplanes in the city Thursday ready to leave with mail for both the East and the West. In the days preceding Thursday we will make every preparation to carry the services through on the opening day."

Three aeroplanes which landed at Ravenna, and Painesville, Ohio, and Sharon, Pa., last week are expected in Cleveland December 31.

Christmas Aerial Mail

The Post Office authorities at Washington at the city office announce that over 27,000 pieces of Christmas mail were delivered at the city office for transport by aerial mail service. This is the largest volume of business that the aerial department has so far transacted in a single day.

Brazil to Have Aero Mail Service

Washington.—Brazil will shortly have an aero mail service between its principal cities. The Government has granted concessions to a corporation allowing it to establish aeroplane mail service between the various capitals of the States of Brazil. Activities will comprise carrying of small parcels of mail, and, with further development of aviation, carrying of passengers. The number of trips and the tariff will be regulated by the Government. All mail matter transported must be properly stamped and postmarked. In time of war the Government may take over the service.

Aero Mail for Chili

Santiago, Chile.—Included in the New Year's festivities here will be a ceremony marking the inauguration of an aerial mail service between Santiago and Valparaiso.

Resume Aero Mail Service to Fleet

Fighting a headwind of forty miles an hour all the way down the Potomac and across Chesapeake Bay, the first mail hydroaeroplane to leave the Anacostia station for a week landed on the storm waves at Hampton Roads, with the official mail for the Atlantic fleet.

This pioneer naval mail service has been interrupted for almost a week by high winds and heavy fogs which have prevailed off the Virginia coast. In the face of threatening weather, the hydroaeroplane at Hampton Roads did not attempt the flight to this city.

It is expected that regular daily service in both directions will be resumed as soon as weather conditions permit. Service will be continued at least until the freezing of the river makes landings impossible.

The consignment of mail carried to the fleet was unusually heavy, being the result of several days' accumulation. It was, for the most part, official matter.

The naval aero mail service between Washington and Hampton Roads was begun on November 16.

Aero Mail Increases 600%

Aero mail has increased 600 per cent during the past month, postoffice officials announced December 20. This is attributed to the mailing of Christmas cards by this novel medium, and also to the rate reduction on one ounce of first-class matter from 16 to 6 cents.

First trip of aerial mail from the Atlantic to the Pacific across the Isthmus of Panama, which was made by Major Walter W. Wynne recently. Major Wynne is shown receiving a pouch from the postmaster at Cristobal, Canal Zone, ready to start for the flight

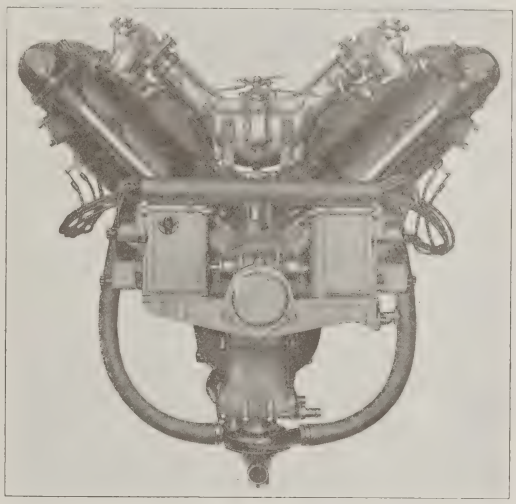
THE HISPANO-SUIZA ENGINE

(*Concluded from page* 816)

Magneto Mounting

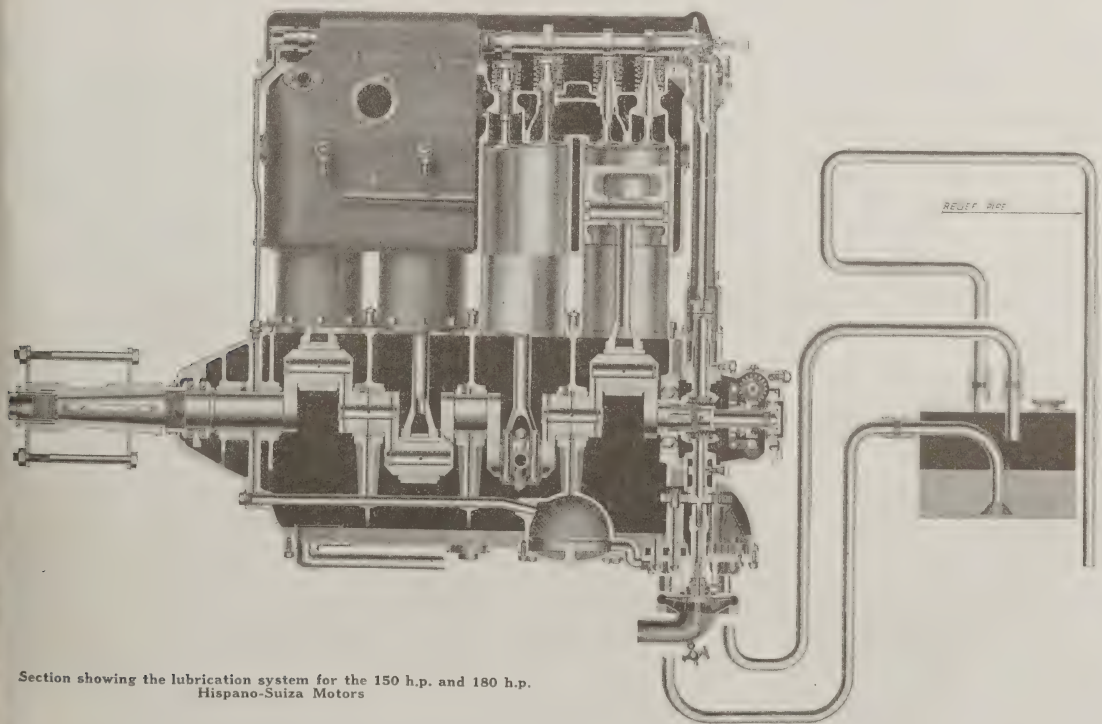
ON ALL models two magnetos are used, firing two sets of plugs simultaneously. On Model A the magnetos attach to platforms integral with the upper half of the crankcase and are situated directly behind the cylinder blocks, with their shafts parallel to the crankshaft. On each magneto shaft a bevel pinion is mounted, engaging with a gear attached to the upper end of the lower vertical shaft. That is to say, immediately beneath the screwdriver connection on the camshaft drive.

On Models E and I the two magnetos are mounted crosswise of the engine on a special bracket bolted to the rear end of the crankcase, and this bracket incloses a spiral gear. The upper member of this gear has a short transverse shaft on each end of which the magneto couplings are mounted, and this runs in ball bearings housed in the aluminum of the bracket. The couplings float, that is, they allow for sufficient universal joint motion. The lower of the spiral gear pair has a shaft of which one end is set in a ball bearing in the bracket while the other end has a tongue which engages with the slot in the end of the crankshaft.



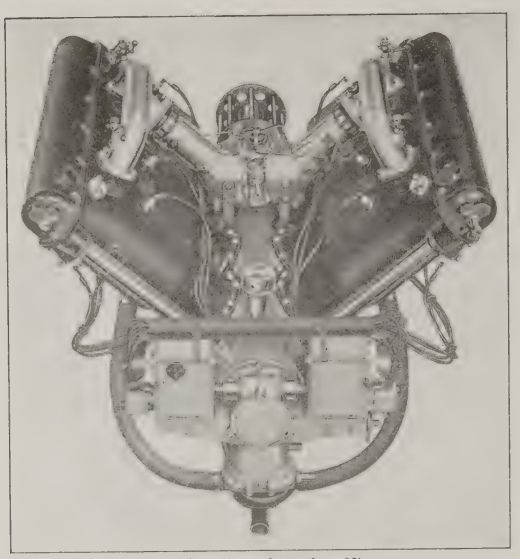
This design enables the magnetos to be detached more readily, since they are driven by couplings of an easily detachable nature. It should also be noticed that on Model A both magnetos are the same and operate with left hand rotation, while on the other models one is arranged for right hand and the other for left hand, as they face apart, but are driven by one shaft.

Pistons and Connecting Rods

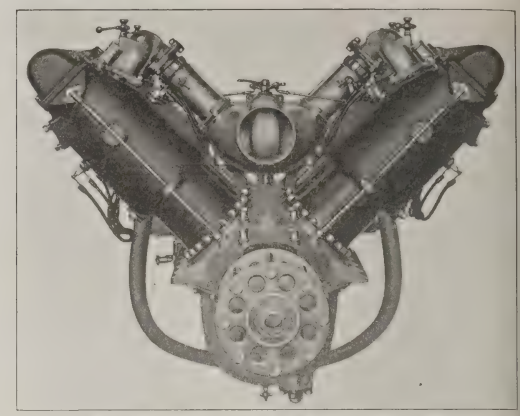


For all models the pistons are aluminum and the connecting rods of round section completely drilled out for lightness, but the detail is different. Model A pistons are webbed beneath the heads and the wrist pins are fixed, being secured by a set screw which passes completely through the wrist pin and piston boss, being itself locked by a cotter. Each piston carries four compression rings which are very narrow and fit in two grooves, while there is also an oil scraper ring near the bottom of the skirt.

Models E and I pistons are identical in form, except that the Model E is of different dimensions, so as to give the increased compression. These pistons have no ribbing beneath the head, the head itself being very thick. The wrist pins float, that is, they are free to turn in the piston bosses as well as in the small ends of the connecting rods. They are prevented from endwise movement by means of a special ring which encircles the piston on the centerline of the wrist pin.



Model A connecting rods consist of an inner rod and an outer. The inner has a lower end which is split like the conventional design of rod, the cap being held on by two bolts. The lower end and cap are not only bored and babbitted on the inside to fit the crankpin, but are also turned and babbitted on the outside, the center portion where the bolts come being kept very narrow. The outer rod is forked, and consequently



Pump end of the Hispano-Suiza, showing cross driven magneto

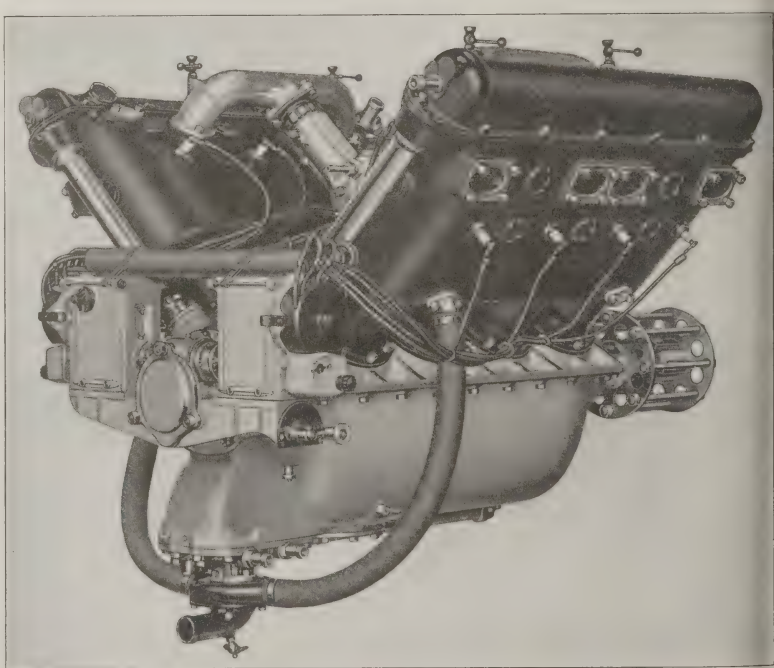
3 Semi plan view of 300 h.p. Hispano

Note small total height of 300 h.p. in end view

has the equivalent of two caps joined together by a sort of bridge. It encircles the inner rod, taking its bearing on the external babbitted portion of the inner rod.

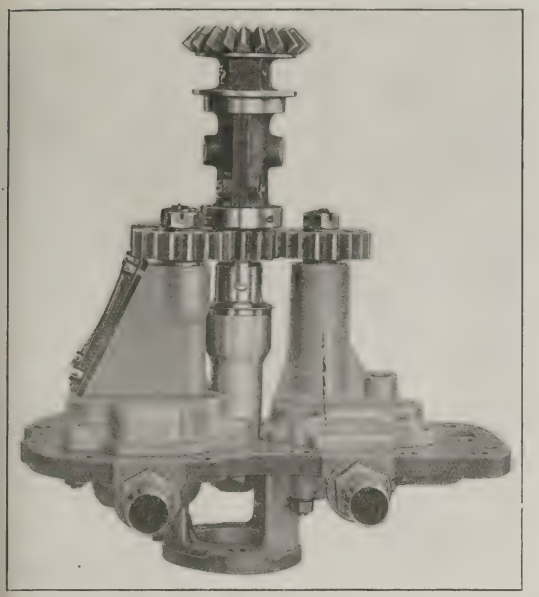
While this construction is extremely light, it is very difficult to make, and the process of babbitting the inner rod is far from easy. Special tools are required for boring the inner babbitt and insuring that the outer babbitt is perfectly concentric with the inner. It is a job which cannot be undertaken without special equipment.

On Models E and I the intricate lower end is replaced by a diecast bronze box of what is called the "marine type." This is lined with babbitt and fits the crankpin. The forked connecting rod terminates in two flat feet and attaches to the bronze box by four bolts which also hold together the two halves of the box, the latter being split in the conventional way.



The outside of the bronze in the space between the two feet of the forked rod is turned and forms the bearing for the other connecting rod lower end, this being split in the conventional way and held together by two bolts. This design allows for the fitting of a new set of bearings with ordinary tools and methods. Also the bronze being a very good conductor helps to dissipate the heat produced by the friction.

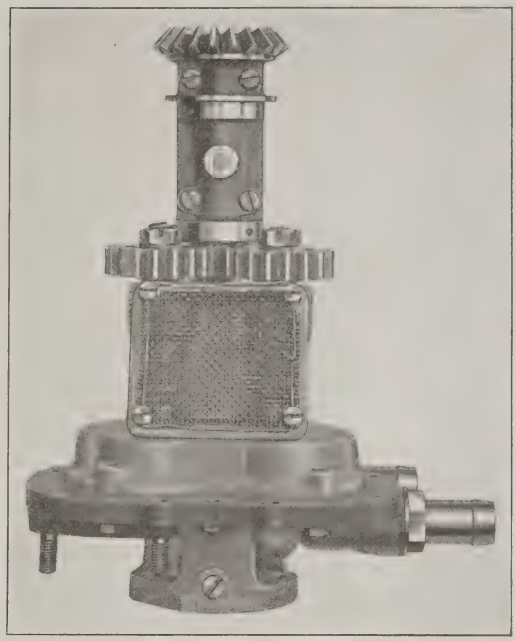
Oil Pump Lubrication System



There is one main oil channel, this being a steel tube cast in the lower half of the crankcase, in which the oil pump is located, as already described. From this main channel oil passes to the four main bearing bushings. Each bush is encircled by a groove cut in the aluminum, which is thus kept full of oil. Passing through holes in the bushing oil reaches the crankshaft, and passing on through holes in the shaft completely fills the inside thereof, passing out again through other holes which lead to the lower ends of the connecting rods; further holes in the inner connecting rod members leading oil to the outer rod bearing. Piston and wrist pin lubrication is performed by the oil spray exuding from all bearings.

Camshaft and valve lubrication is obtained by taking oil from the groove around the front end main bearing and leading it up through two small steel pipes, one attached to each cylinder block. These lead to holes in the aluminum, registering with holes in the front end camshaft bearings. Thence the oil enters the camshaft itself, which is hollow from end to end, and small holes drilled in each cam allow lubricant to be discharged directly upon the tappets. These holes are on the opening face of the cam and so oil the tappet head just as the cam begins to lift. The excess not only lubricates the valves themselves, but flows into the bearing supporting the upper vertical shaft. Here it obtains access to the space inside the tube inclosing the vertical shaft, falls down this, lubricates the lower vertical shaft bearings and returns to the crankcase through the hole drilled right through the lower vertical shaft. Every bearing and gear is thus taken care of in proportion to its requirements.

Here occurs another difference between the models. Model A *can* be used with the whole supply of oil contained in the sump, the oil pump sucking from the middle of the sump through another steel tube fixed in the crankcase, but this is very poor practice. Oil on returning to the crankcase should be allowed to run out of the bottom, into an oil radiator, placed well beneath in a good air draft, whence it is drawn by the pump.

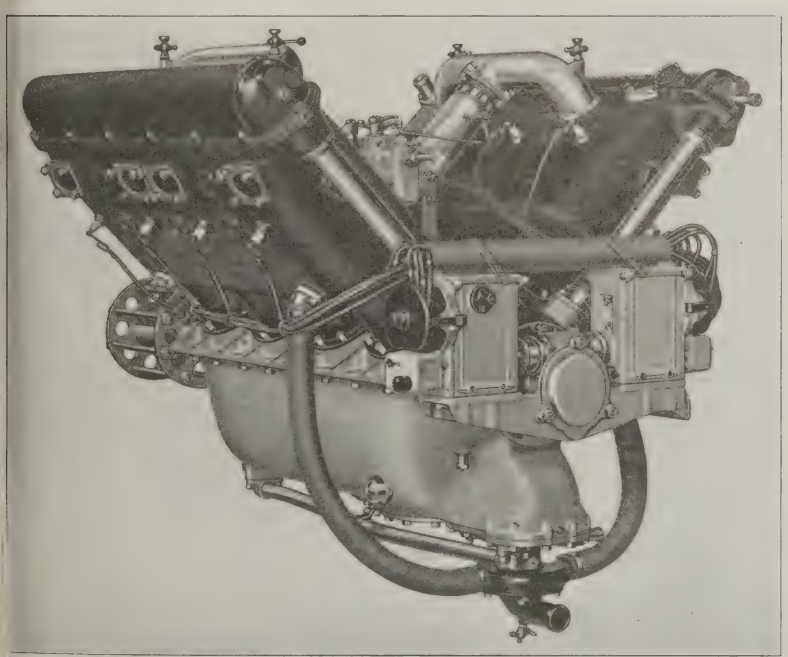


300 h.p. Wright Martin Hispano in shipping condition, in which state it weighs exactly 600 pounds

Complete oil pump assembly for 300 h.p.

On Models E and I there is a second oil pump supplied for the express purpose of keeping the crankcase empty. This is a gear pump attached to the rear of the magneto bracket, taking its drive from the rear end of the magneto shaft. This sucks from the crankcase and forces the oil through the oil radiator to a tank which is mounted on the plane, preferably in some position where it will be kept cool by air draft. The force pump then draws its supply from this tank, getting oil which is well cooled. In aeroplane engines the duty of the oil is not only to lubricate the bearings, but also to carry heat away from them, thus it is important to provide for ample cooling of the oil.

On all three models the pressure oil pump is the same. It consists of a shaft having a slot cut in it in which fit a pair of bronze vanes forced apart by springs. This shaft passes through a hole in the pump body which is eccentric with the shaft. The hole is of the same length as the vanes and the



Oil screen on intake of pump

springs hold the vanes pressed tightly against the sides of the hole.

Owing to the eccentricity, as the shaft turns the vanes slide in their slot at the same time that they are being revolved. Suppose now we think of the section of the pump when the shaft is in such a position with respect to the hole in the body that the vanes are truly central, projecting equally on either side of their slot. Then, because of the eccentricity, the space between the shaft and the body on one side of the vanes will be greater than that on the other side.

On the side with the larger space there are holes in the pump body connecting with the suction line, while on the opposite side are holes leading to the pressure lines. As the shaft turns the oil contained on the large side is swept round and compressed into the smaller space on the other side, the process repeating itself twice each revolution.

There is an oil screen between the pressure outlet of the pump and the entrance to the oil supply channel, this screen being screwed into a cavity in the crankcase whence it can readily be removed for cleaning.

This view shows the great compactness of the 300 h.p. design

Water System

The water pump is a simple centrifugal type with two outlets. It is placed directly beneath the oil pump, attached to the crankcase through the medium of a bronze bracket. The lower end of the oil pump shaft is carried out through the crankcase and is furnished with a square hole. Into this hole the squared end of the water pump shaft fits, there being two packing glands, one to prevent

escape of oil downward and the other the conventional gland to retain the water. The pump delivers through two pipes, rubber in some installations and in others copper, to the lower, outside rear corners of the cylinder blocks. From these it passes out to the radiator through two pipes attached to the upper, inside front and corners of the jackets.

Carburetion

Two types of carburetor are used, the Zenith, which is found on all the older engines, and the Stromberg, adopted in the early Summer of 1918. There are two intake flanges on each cylinder block connected together by cast aluminum pipes, and these lie close against the blocks. Above the carburetor there is another aluminum casting having two side outlets and two underneath. To the latter the two outlets of the duplex carburetor connect the side outlets attaching to the center of each intake branch. On one side the connection is by a flange bolting solidly in place, and on the other side there is a short intermediate piece provided with a gland, allowing for expansion. This center casting has a water jacket. This layout with the double form of carburetor is equivalent to two separate carburetors and intake systems, one for each block.

Details

In most aeroplane installations gasoline is fed to the carburetor by air pressure. For this purpose the left hand valve cover carries a small air pump which comprises a bronze cylinder and a piston with a cup leather. The piston is driven from the rearmost exhaust cam, its suction stroke being given by a spring that is compressed on the working stroke of the pump. The pump is not adjustable and supplies air at a higher degree of compression than is ever likely to be required. Various regualting devices for controlling the pressure in the fuel tank are in use, but these are not part of the motor.

The rear end of each valve cover is provided with a threaded boss, and each camshaft has a screwdriver slot in the rear end. In all installations a tachometer or motor speed indicator is used and the flexible shaft for driving this instrument is attached to a special connection supplied with the motor. This consists of a short brass body, screwing in a boss on the valve cover and containing a short shaft meshing with the camshaft slot and arranged at the outer end to take the standard form of fiexible shaft connection.

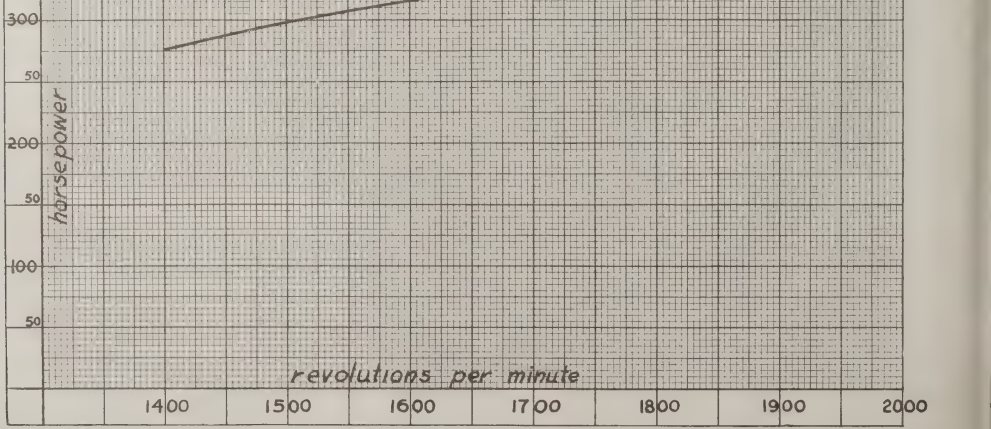
Normally no accessory is driven from the other camshaft and the hole in the end of the valve cover is plugged, but it is always available for driving another accessory.

On some installations, especially naval planes, a starting crank is attached. In the Model A this replaces the cover usually found on the rear end of the crankcase. The hand starting crank usually has geared to it a small magneto which supplies extra current for starting.

The propeller hub which fits on the taper at the front end of the crankshaft is not an interchangeable part in the ordinary sense of the word. Each hub is lapped by hand till it is a perfect fit on the taper and the key only performs part of the function of taking the drive, since the hub is drawn very tightly on the shaft. If the hub is not a perfect fit too much stress comes on the key and the hub is liable to "work" on the shaft. This will tear the shaft and hub and perhaps make it impossible ever to remove the hub. The nuts used for locking the hub in place differ. On Model A there is a single nut with a coarse internal thread screwing on the crankshaft and a fine external thread, screwing into the boss of the hub. This nut screws on the shaft faster than it screws into the hub, so that the hub is pushed onto the taper with considerable pressure. The reverse of this action, of course, assists the removal of the hub.

On Models E and I there are two nuts which are the equivalent of the single nut of Model A. That part screwing into the hub is free to turn on the outside of the nut screwing onto the shaft. In this instance the hub is pushed on by screwing up the inner nut and then finally locked home by the outer nut.

The 300 H. P. Engines

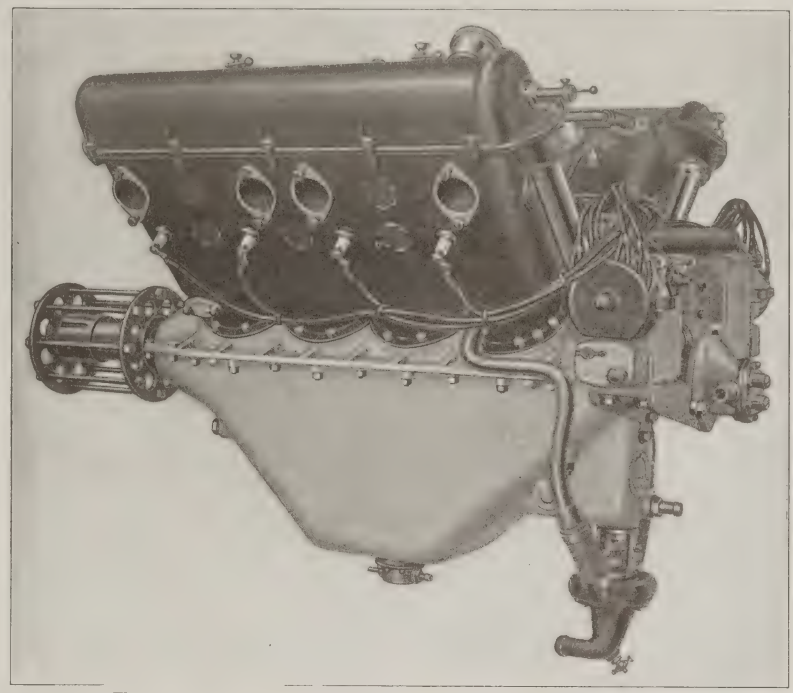


The French 300 h.p. motor is very similar to the original French 150 h.p. except that it has the magnetos arranged crosswise precisely as on the American models E and I. It has bore and stroke 140 by 150 mm. and the average power developed is about 290 h.p. at 1,600 r.p.m.

The Wright-Martin 300 h.p. differs in three salient respects. Firstly it has the Crane design of connecting rod, using marine type lower ends, as in the other Wright-Martin motors. Secondly the lubrication system is altered, the vane pump being abandoned in favor of a gear pump. Thirdly the cylinder sleeves are 30 mm. longer and there is more water space in that portion of the jacket which comes above the valves, and the valve lift is 2 mm. greater.

Due to this last feature, and also to the valve timing, it is possible to obtain a very high mean effective pressure and to maintain this for long periods because the valves do not overheat. Water is carried down very close to the valve seats in sufficient quantity to prevent excessive local heating. On the official test at the Bureau of Standards, Washington, D. C., this engine developed 315 h.p. at 1,600 r.p.m., which is equivalent to a m.e.p. of 139 pounds per square inch, and at 2,000 r.p.m. nearly 360 h.p. was obtained. Repeated tests with different motors have shown that 310 h.p. at 1,600 can be maintained indefinitely without overstressing any part of the engine. In the air it has been operated at speeds in excess of 1,700 r.p.m., delivering nearly 350 h.p.; also for long periods continuously.

The weight of the motor complete with carbureter and magnetos is just 600 pounds, equivalent to one and five-sevenths pounds per h.p. A graph showing the official power curve obtained by the Bureau of Standards is given below.



The purpose of making the cylinders longer was largely to do away with the overrun of the pistons. In the French design the pistons come well out of the cylinders at the bottom of the stroke, and thus get deluged with oil. In the Wright-

Martin motor the pistons are always completely within the sleeves and as a result the oil consumption came out only two-thirds that of the French. Actually it is five quarts per hour when operating at full power.

The reason for changing the oil pump design was partly that the gear pumps are a little easier to manufacture, but the principal object was to make a pump which would have no wearing part. Further, the gear pump is so arranged that it sucks from both ends of the crankcase, and the case is thus able to be kept shallow. The engine operates with a dry case, all oil being immediately sucked out of the lower half as it drops from above and pumped to the tank. Inclination of the motor makes no difference, since if the suction port at one end of the case is uncovered, that at the other is submerged.

After being drawn from the case, the pumps force the hot oil through an oil radiator and into a tank, or else direct into a tank, which is so exposed as to act as a radiator. In the new Loening plane, for example, the tank is of narrow section and is placed outside and close against the fuselage, where it obtains ample cooling. However, in any case, oil is taken from the tank by another gear pump and forced to the bearings, the circulation from that point being the same as for the other sizes of motors.

Three-quarter rear view of the complete E or I Hispano-Suiza motor

In the whole oil pump assembly there are three pumps. One, the force pump, is a separate and complete unit; two are the suction pumps for keeping the case dry. One is connected to the front end of the case by an external pipe, the other takes its supply direct through a hole in the pump body. Each pump, of course, has to have a pair of gears, but the three are arranged so that the middle gear wheel serves as one-half for each of the two, thus saving weight and increasing simplicity.

The oil straining is performed on the outlet side of the force pump, there being a very large screen of hemispherical shape located within a chamber cast in the lower crankcase half. This strainer is held in place by a cover and can readily be removed.

Originally the piston of the French motor was similar to the old Model A, with deep webs beneath the head and a fixed wrist pin, the Wright-Martin engine having a simpler piston with a thick head and no ribs, and also a floating wrist pin. This type was later taken up by the French and is the design which was put into European production.

Many experiments have been tried with piston rings and the results show that the four narrow rings generally give better results than two wide ones, but the narrow rings have some drawbacks, so the American 300 h.p. piston is provided with three comparatively wide rings, each in its own groove. There is a scraper ring near the bottom of the skirt, and the piston pin is held from endwise motion by aluminum end pieces. These fit in the pistons, being prevented from turning by tongues, engaging slots cut in the piston itself. In the French design the piston pin is secured by a ring passing across its ends, just as for the American Models E and I.

The Curtiss "NC-1" Type Flying Boat, one of the Largest Navy Flying Boats

THE DE HAVILLAND 4, WITH LIBERTY '12' ENGINE

THE de Havilland 4 with the Liberty engine has been one of the successful associations with America's air program. For reconnaissance and bombing the British have used the de Havilland 4 with a 300 H.P. Rolls-Royce engine, and the adoption of the Liberty 12 has given the United States superior results in both performance and production.

The data and drawings given here are from the de Havilland 4 built by the Standard Aero Corporation, Elizabeth, N. J.

With slight modifications in its equipment, the de Havilland 4 is used for reconnaissance, bomb dropping and fighting. Complete night flying equipment is installed, consisting of green and red port and starboard electric lights near the ends of the lower plane, a rear white light on the deck just aft of the gunner's ring, and wing tip flare lights near the wing tip skids.

Current for lighting and wireless is supplied by two generators attached to the inner sides of front landing gear struts. A camera is clamped to a padded rock on the interior of the body aft of the gunner's ring, where it is conveniently operated by the observer. Dual control is installed, and control stick is quickly detached and removed by pressing a spring catch when it is not necessary for the observer to take control.

Racks are provided for twelve bombs which are held in place horizontally under the lower planes, near the body. The release is accomplished from the pilot's cockpit by means of bowden cable. A sighting arrangement is built into the body just behind the rudder bar.

Four machine guns are installed. Two fixed Browning guns are mounted on the cowling forward of the pilot, operated by the "C. C." automatic interrupter gear or the Nelson direct mechanism, which releases the trigger at each revolution of the engine crankshaft. Two movable Lewis guns are carried on a rotatable Scarff ring surrounding the rear cockpit.

A telescopic sight is provided for the two fixed forward guns and a ring and bead sight for the twin Lewis guns.

Instruments carried are: Two gasoline pressure indicators, speed indicator, tachometer, altimeter, thermometer, clock, hand pressure pump, inclinometer, map board, and compass.

20,000	105	....	.....

Main Planes

There is no sweepback, but upper and lower planes are attached to a center section and the body, respectively, at a dihedral angle of 174°.

Aspect ratio of both planes, 7.7. Angle of incidence, 3°.

Fuselage

Veneer is used for covering the fuselage from the radiator to the gunner's cockpit, and no diagonal bracing is therefore employed in this part.

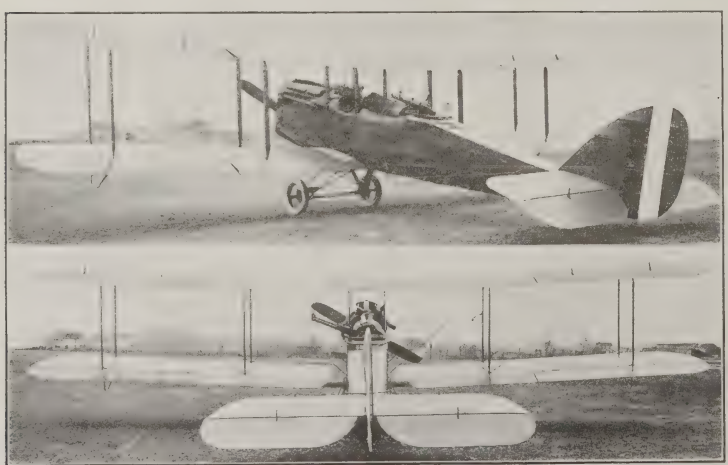
The rear end of the body is constructed in the usual girder fashion, and the longerons, of spruce, are spliced. Veneer is used underneath the tail plane for covering the body.

Tail Plane

Attachment of the tail plane is such that its inclination can be varied from the pilot's cockpit during flight. Its front edge is hinged and the rear end braced by wires attached to a vertical post in the fin. By means of a cable wrapped around a drum and worm at the lower end of the post the rear brace wires are raised or lowered, and the trailing edge of the stabilizer is correspondingly raised or lowered, permitting the setting to be adjustable within the limits of $-2°$ and $+5°$.

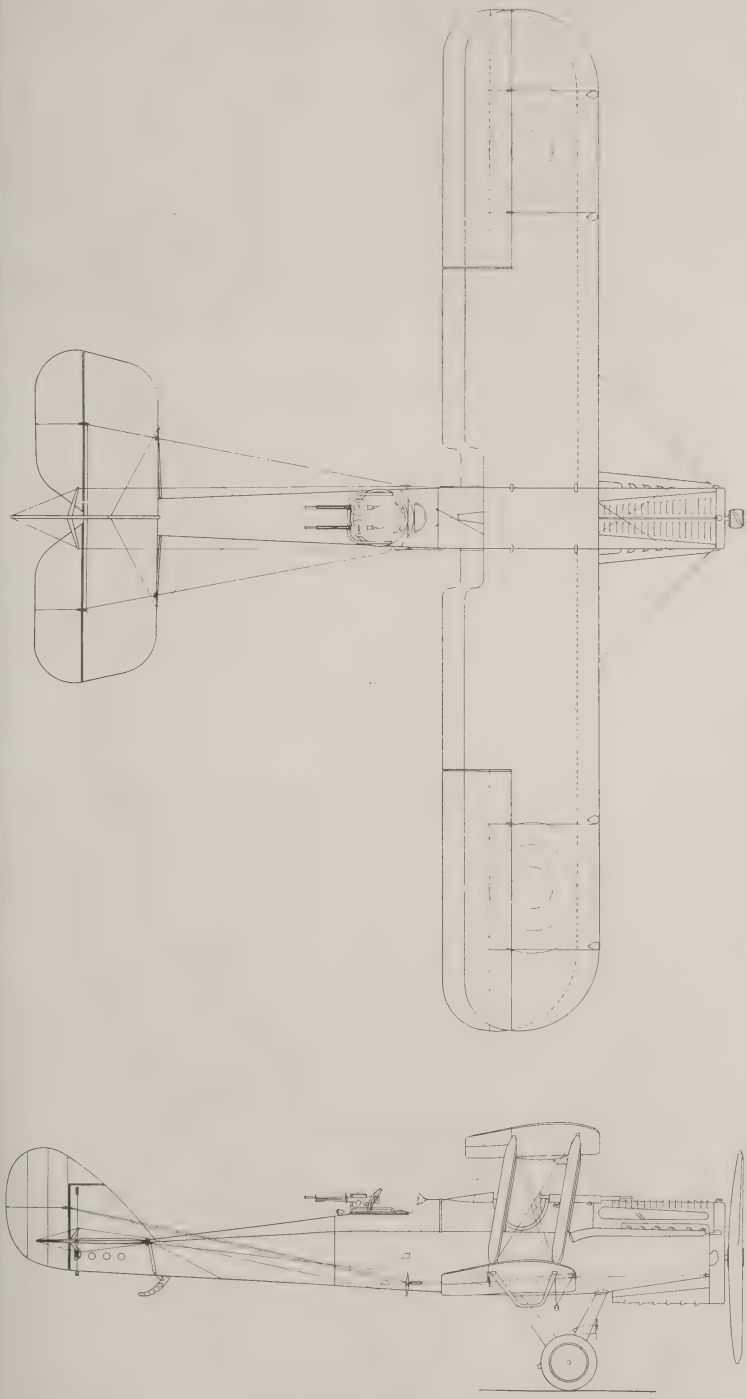
Engine Group

Drawings and a description of the Liberty Motor appeared in the December 1st issue of AERIAL AGE.



The engine is a twelve-cylinder Liberty "12" which develops 400 H.P. at 1,625 r.p.m. Bore and stroke 5 by 7 inches. Cylinders are set at a 45° V.

Zenith carburetor and Delco ignition are used.



Fuel consumption .54 lbs., and oil .03 lbs. per h.p. per hour. Fuel tanks are located at the center of gravity. Capacity 67.6 gallons. Oil tanks under pilot's seat have a capacity of 5.6 gallons.

The radiator is provided with shutters operated from the pilot's cockpit, to cut off part of the cooling surface when flying at low temperature.

Propeller, 8.6' diameter and 10.7" pitch. When at rest on the ground the propeller hub is 6' 0" above ground, and in flying position it is 5' 0" above ground.

THE HUGHES AIRCRAFT REPORT

TENTH—SPECIAL MATTERS

(Continued from last week)

1—Purchase of the Plant of the General Vehicle Company

In November, 1917, the Government purchased the plant of the General Vehicle Company at Long Island City, New York, for $1,527,568. The purchase embraced all the real estate, building and machinery constituting the plant, and all other assets, except that patents (other than those relating to internal combustion rotary aircraft engines), franchises, good will, cash, bills and accounts receivable, specified securities and all inventory assets not acquired and used in connection with the manufacture of Gnome engines, were retained by the General Vehicle Company. The Company also agreed to release for the use of the Government its administrative and manufacturing organization so that the Government might take over the plant property and organization as an active manufacturing establishment in full readiness for production. Upon a physical valuation and inspection of the books of the Company by Government appraisers and accountants showing that the price was a fair one on the basis of prices previous to the war, and upon an opinion of the Judge-Advocate General as to the legality of the purchase and as to the propriety of the form of contract, the purchase was recommended by the Aircraft Board.

The advisability of the purchase, however, was doubted at the time by officers of the Government. It appears that at the outset, in formulating the aircraft program, it was supposed that the Gnome rotary engine would be a factor of some importance, and a small order for Monosoupape motors was placed with the General Vehicle Company, but in view of doubts as to the planes to be built, with which such engines would be used, further orders were not placed. Later, on word from overseas that Gnome rotary engines should be put into production, there were negotiations with the General Motors Corporation looking to the acquisition of the General Vehicle plant and the manufacture of these engines in large quantities. Before the matter was closed, the instructions from abroad were changed and the proposed transaction was abandoned. The considerations underlying the purchase are stated in the recitals of the Aircraft Board in the resolution adopted at its meeting of October 19, 1917. It was stated that advices from France indicated a doubt as to the future demand for rotary engines in aviation, but that nevertheless these engines would be used to a greater or less extent for a considerable period to come; that it was desirable that "the technique of manufacture of rotary engines should in any event be studied and developed in the United States in case of need"; that the General Vehicle Company had "the only plant and organization of substantial size in the United States, equipped and organized with the necessary facilities and experience for the manufacture of such engines"; and that the present and future demand for rotary engines was "not sufficient in amount or sufficiently continuous to justify a manufacturer in the maintenance of a plant and organization adequate for a prompt supply of such engines and for the proper study and development of the technique of that type of engine."

In a previous part of this report (*ante*, p. 98), reference has been made to the opinion of the Joint Army and Navy Technical Board, given on November 16, 1917, that in the program for the coming year rotary engines should be considered of secondary importance, but that it was deemed desirable that the art of building rotary engines should be retained in the United States and that for this purpose the organization skilled in rotary engine production should be preserved. While it was thought that an order which had been given to the Union Switch and Signal Company for 2,500 80 H. P. LeRhones was larger than was necessary to preserve the art, it was further recommended that steps be taken to maintain the possibilities of production of the 160 H. P. Gnome engine. The resolution of the Joint Army and Navy Technical Board did not in terms approve the purchase of the General Vehicle Company's plant, nor did it express opposition in any definite way.

The actual necessity of the purchase of the General Vehicle Company's plant is not apparent. As soon as the Government made the purchase, a corporation called the Aeronautical Engine Company, with a nominal capital, was incorporated for the purpose of building Gnome engines at the plant, and contracts were made for the manufacture of small quantities at cost, without profit. This, however, did not continue long. It was found that the Union Switch and Signal Company had mastered the art of making LeRhone engines, and although these were of a different type, it seemed that the necessity of keeping the organization in existence at the plant purchased from the General Vehicle Company soon ceased, or was very much minimized. In April last, it was proposed that the plant at Long Island City be leased to the Wright-Martin Company for the manufacture of the 300 H. P. Hispano-Suiza engines, and an arrangement for this purpose was made soon thereafter, one of the reasons being stated to be "the practical abandonment of the manufacture of Gnome motors."

At the time of the purchase of this plant by the Government, the General Vehicle Company had outstanding notes amounting to $1,530,000, which were held by the Peerless Truck and Motor Corporation. The purchase price paid by the Government was substantially equivalent to the amount of these notes and thus provided for their retirement. The purchase, however, was made on the basis of the value of assets, and whatever difference of opinion there may be as to the advisability of the purchase, there are no facts warranting the conclusion that it was not made in good faith or that the amount paid was in excess of the fair value of the property acquired.

2—Mahogany Manufacturers and Importers Association

True mahogany is a desirable wood (ranking in the opinion of the Government's production engineers next to Black Walnut) for the making of propellers for service or combat aeroplanes. To meet this demand, contracts had been made for Mahogany in the Fall of 1917, but with only one responsible corporation, that is, Lewis Thompson and Company. A contract with one of the companies selected was cancelled because it was apparently without financial resources and could not provide a bond, and in the case of another contractor no deliveries were made.

In the beginning of January, 1918, it appeared that there was a serious shortage in the Government's supply of wood for service-plane propellers, and through the War Trade Board the leading Mahogany manufacturers of the United States were invited to a conference in Washington. This conference was held on January 21st, and at that time, or in the later conferences, the following corporations and firms were represented: Huddleston-Marsh Mahogany Company, Ichabod T. Williams & Sons, George D. Emery Company (said to be closely affiliated with I. T. Williams and Son) and the Astoria Veneer Mills and Dock Company of New York; Palmer, Parker and Company, of Boston; Lewis Thompson and Company, and S. B. Vrooman Company, of Philadelphia; Freiberg Lumber Company, of Cincinnati; C. C. Mengel and Brothers Company, of Louisville; Talge Mahogany Company, of Indianapolis; C. L. Willey Company, of Chicago; and the Otis Manufacturing Company, of New Orleans. At the first conference the manufacturers were notified of the Government requirements for propeller stock, their cooperation was sought, and they were asked to advise the Government of the quantity which each could furnish, and the price. The representatives of the War Trade Board suggested the advisability of an organization of the manufacturers to secure effective cooperation with the Government, and accordingly an association of the manufacturers was at once formed, which appointed a War Committee composed of A. S. Williams, of the Astoria Veneer Mills and Dock Company; C. H. Thompson, of Lewis Thompson and Company; F. C. Leary, of Ichabod T. Williams and Sons, F. G. Otis, of the Otis Manufacturing Company; and J. C. Wickliffe, of the C. C. Mengel and Brother Company. The Committee met at once and passed a resolution expressing the opinion that the best interests of the Government would be served by the purchase by the Government "of all Central American mahogany logs now under contract with the members of the Association at a price to be agreed upon; the Government to arrange transportation of said logs; the manufacturing of the logs into lumber to be done by the mills represented by this Association at a price to be agreed upon." At the same meeting, the officers of the Association were elected: Thomas Williams, of Ichabod T. Williams & Sons, President; R. S. Huddleston, of the Huddleston-Marsh Mahogany Company, Treasurer; and Charles H. Thompson, of Lewis Thompson and Company, Secretary. This proposition was rejected by the representatives of the Signal Corps, for reasons stated at length, which were in substance that it was deemed inadvisable that the Government should arrange for the purchase of logs directly from the loggers in Central America and Mexico in view of the unfamiliarity of the Signal Corps with the logging business, or that the Government should take over existing contracts for purchases of logs on account of the complications that might arise, or that the Government should become directly involved in log purchases. Recognizing the difficulties in the disposal of a largely increased quantity of lumber, the representatives of the Signal Corps felt disposed to pay "a higher price than pre-war or existing prices for propeller stock," in order that the mahogany manufacturers might offset any loss due to the low market value of rejected material. It was then recommended by the Signal Corps that the manufacturers should make a proposition as to the price to be paid for propeller stock, and it was stated for the manufacturers that they could not quote prices on the basis of the existing Signal Corps specifications, as these were too restrictive as to the grade to be selected and permitted the Signal Corps to accept or reject the material based upon the judgment of the inspector. It was finally suggested that the manufacturers should submit a proposition based on what are called 'National Hardwood Inspection' rules (that is, the rules of the National Hardwood Lumber Association) quoting a separate price on "first and seconds, selects and No. 1 common". Discussions continued between the War Committee of the Association and representatives of the Government, among the latter being Lieutenant Ryerson, who was in charge of propeller parts in the Plane Production Section; Joseph S. Otis (who, as the result of a disagreement, had recently severed his connection with the Otis Manufacturing Company and had offered his services to the Government as a mahogany expert) and representatives of the Lumber Committee of the Council of National Defense. At the meeting on January 23rd, according to Lieutenant Ryerson's report, the War Committee of the Association suggested prices for propeller mahogany according to 'National Hardwood Inspection' rules as follows: firsts and seconds, $350 per M feet; selects, $320; No. 1 common, $270. After these figures were submitted a discussion of costs followed, in which Joseph S. Otis, representing the Government, and J. C. Wickliffe, representing C. C. Mengel and Brother Company, gave their respective estimates of costs. Mr. Otis' estimate was considerably lower than the other and was contested by Mr. Wickliffe. The question of specifications was again discussed, and the Signal Corp representatives stated that it would be impossible to place orders on the basis of 'National Hardwood Inspection' rules, which permitted widths considerably less than those required for propeller stock. After further parley, Lieutenant Ryerson stated that it would be preferable to negotiate with the various manufacturers and importers individually for the purchase of such mahogany as they were in a position to offer. It was considered that if negotiations could not be brought to a close on the basis of the prices quoted that it might be desirable for the Government to fix a price for the purchase of propeller stock and agree to provide in its contracts that after partial performance there should be an audit of costs and a readjustment of prices upon a fair basis.

After the negotiations had thus proceeded for several days, the manufacturers submitted to the officials of the Signal Corps the opinion that Joseph S. Otis was not competent to advise the Signal Corps with respect to mahogany costs and suggested that action should be taken by which some one should be put in charge of the purchases of mahogany for the Government "who could develop the actual facts and be fair to the industry." Joseph S. Otis left the Signal Corps on January 29th. On January 31st Henry Lockhart, Jr., was placed in charge of the 'Materials Department, Foreign and United States,' which had the duty of procuring the materials necessary for the production of aeroplanes, with the exception of motors and instruments. About February 5th, Henry K. S. Williams, who had formerly been in the lumber business as a member of the firm of Ichabod T. Williams & Sons,) being a brother of Thomas Williams of that firm) but had retired several years before, was put at the head of the Hardwoods Section, which was a sub-division of the Materials Department and had charge of the orders for woods required for propeller stock. Shortly after, on February 25th, J. C. Wickliffe, who had been for ten years Secretary of the C. C. Mengel and Brother Company of Louisville, and had been active as a member of the War Committee of the Mahogany Manufacturers and Importers Association, entered the service of the Government as assistant to H. K. S. Williams in the Hardwoods Section. The suggestion that he should take this position was made about the middle of February in a conversation between H. K. S. Williams and Mr. Mengel when the latter was asked if he could spare Mr. Wickliffe from his organization. On March 4, 1918, J. Edward McCullough, who had been superintendent at the mill of the George D. Emery Company, one of the members of the Mahogany Manufacturers and Importers Association, was made district inspector of mahogany as well as other woods in the New York district, embracing Boston, New York, Philadelphia and New Orleans. He was selected by S. B. Vrooman, Jr., who about February 10th was given general charge of the inspection of all propeller lumber throughout the country. Prior to his connection with the Government (he started as an inspector in December, 1917) S. B. Vrooman, Jr., had been in the service of the S. B. Vrooman Company, also one of the members of the Mahogany Manufacturers and Importers Association; he was, and has continued to be, during his service with the Government, one of the stockholders of that corporation (*ante*, p. 68).

Mr. Wickliffe, during his connection with the C. C. Mengel and Brother Company, had owned five shares of its preferred stock, which he disposed of some years ago; his wife owned five shares of the common stock, which were sold when he entered the Government service.

His salary as secretary of the Mengel Company had been $500 a month; his compensation from the Government was at the rate of $4,000 a year. When it was suggested that he should become connected with the Government, he said that he could not afford it, but he was informed that Mr. Mengel had offered to continue his salary "as a donation to the Government during the war." Mr. Wickliffe replied that he did not like the arrangement, would not accept it without Mr. Lockhart's approval, and in any event would not consent to be paid for than enough to defray the living expenses of himself and his family. Mr. Wickliffe was paid by the Mengel Company, in addition to his salary from the Government, $250 on March 25th, $250 on March 29th, and $250 on April 15th, a total of $750. This was subsequently adjusted on the basis of $350 for the period to April 1st and $400 was returned by Mr. Wickliffe to the Mengel Company. This was explained in Mr. Wickliffe's letter to Mr. Mengel as follows:

"628 Lexington Place, Washington,
Apl. 13th, 1918.

"Mr. C. R. Mengel,
Prest., C. C. Mengel & Bro. Co.
Louisville, Ky.

"Dear Mr. Mengel:

"The Signal Corps having fixed the salary I am to receive from them at the highest figure they can pay of $4,000.00 per annum, I want to let you know that I think it necessary now that you reduce the amount that you are remitting me monthly to $350.00 per month. As near as I can estimate it, I can get by on Washington living expenses and do such official entertaining as I shall have to do on the sum of these two amounts. If I find that I cannot, I shall frankly let you know the condition. But I feel that living here and doing the necessary at my present job on this figure is about the equivalent of the salary I had when I was with you in Louisville. Therefore, kindly give the necessary instructions to have the remittance cut down.

"Again thanking you and the Company through you, I am,
"Very truly yours,
"J. C. WICKLIFFE."

The arrangement with C. C. Mengel and Brother Company was approved by H. K. S. Williams in his letter of April 24, 1918, as follows:

"Washington, D.C.,
April 24, 1918.

"From: Office of the Chief Signal Officer.
"To: C. C. Mengel & Brother Company,
Louisville, Ky.

"Subject: Services.

"1. In line with the request of your president, Mr. C. R. Mengel, this Section desires to give you this letter stating that at the time it asked you for the services of your former secretary, Mr. J. C. Wickliffe, it was fully understood by it that you or the Mahogany Industry would pay him an amount of money per month over and above the salary the Signal Corps was authorized to pay him, so that the sum of these two would be sufficient to cover his and his family's expenses during their service with the Signal Corps. This was done with the full knowledge of Mr. Henry Lockhart, Jr., Head of the Materials Department, because of the fact that the Hardwood Section needed his services, and in view of the further fact that your offer to do this was made with the distinct understanding that he should sever all connection with your company and with the mahogany industry and assume his new duties, of course, entirely as a member of the Signal Corps organization. This Section would also set forth the fact that your offer was specifically asked by you to be considered in the light of a donation to the war.

"By direction of the Acting Chief Signal Officer.
"HENRY LOCKHART, JR.
"Materials Department, Foreign and United States,
"By H. K. S. WILLIAMS,
"Hardwood Section."

The salary which S. B. Vrooman, Jr., had received from the S. B. Vrooman Company had been continued by that company, and, when J. Edward McCullough entered the service of the Government, the George D. Emery Company paid, until the arrangement mentioned below, the difference between his Government pay and his former compensation from the company.

It was soon arranged that the Mahogany Manufacturers and Importers' Association should assume the payment of the additional compensation to Mr. Wickliffe and to Mr. McCullough. Accordingly, for the period beginning with April this compensation was paid to both in checks from Mr. Huddleston, the Treasurer of the Association. The amounts were raised by voluntary contributions of various members of the Association. The minutes of the Association show the following action in the matter:

"The matter of the difference in compensation between the amount paid by the Government for services to J. C. Wickliffe and to Mr. McCullough and the amount of compensation previously received was discussed. The following resolution was then presented, duly seconded and adopted by the affirmative vote of all present:

"Resolved that such excess compensation be paid by the various members of the Association in the form of an annual subscription, which is made up by various amounts subscribed by the mahogany firms, amounting in total to Fifty-Seven Hundred ($5,700) Dollars.

"The motion was duly made, seconded and carried by the affirmative vote of all present, that a copy of this resolution be sent to Mr. H. K. S. Williams."

Mr. Wickliffe testifies that this arrangement was made "because it was felt that it was not right for any one individual firm to pay it all." Mr. Huddleston testifies that it was "purely a question of cooperation with Mr. Mengel." Early in May there was correspondence between H. K. S. Williams and Mr. Huddleston, the Treasurer of the Mahogany Association, in which a letter in the following form, addressed by Mr. Huddleston to Mr. Wickliffe, was first submitted to H. K. S. Williams and approved by him:

"347 Madison Avenue
"New York, N. Y.,
"May 10, 1918.

"Mr. J. C. Wickliffe,
Materials Department, Foreign & United States,
Hardwood Section, Washington, D. C.

"My dear Mr. Wickliffe:

"A few days ago, when the heads of the various mahogany importing and manufacturing concerns met for general discussion, attention was called to the fact that by virtue of your recent appointment as Assistant to Mr. H. K. S. Williams, your annual income has been cut something in excess of fifty per cent.

"After a general discussion, it was agreed that it would not be fair that you stand alone the burden imposed on you by your services to the Government in this particular Department, therefore, it was mutually agreed that the various mahogany firms, feeling as patriotic as you have demonstrated yourself to be, will make up the difference between your former income and what you are now receiving from the Government, provided such an act would meet with the approval of Mr. H. K. S. Williams, the head of your department.

"I am pleased to advise you that I am today in receipt of a letter from Mr. H. K. S. Williams, approving of this transaction; so acting in the capacity of Treasurer, I will mail you each month a check for $350.00 beginning the month of April, which I am informed will make up the difference in your salary."

A similar letter was written, with the approval of H. K. S. Williams, to Mr. McCullough. Mr. McCullough was paid by the Association for April, May, June and July at the rate of $91.67 a month. He returned to his former employment early in August. In the case of Mr. Wickliffe, the arrangement continued until it was officially disapproved on August 20, 1918, by Mr. J. Gilmore Fletcher, on behalf of the Bureau of Aircraft Production, in the following letter:

WAR DEPARTMENT
Bureau of Aircraft Production
Washington

August 20, 1918.

"Mr. J. C. Wickliffe,
"Hardwood Section,
"119 D Street, N. E.
"Washington, D. C.
"My Dear Mr. Wickliffe:

"In view of the fact that the Government looks with disfavor upon your receiving from the Mahogany Manufacturers & Importers Association your present monthly remittance, which I shall refer to here as a salary of $350.00 per month, I deem it best, and hereby request, that you immediately refuse to accept any further payments from that source, or any other source which comes in direct line with your duties in the Hardwood Section, the Raw Materials Department, Division of Aircraft Procurement, Bureau of Aircraft Production.

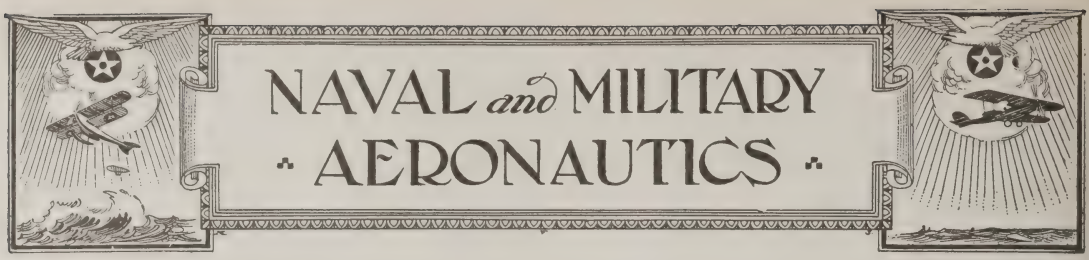
"I shall at once take the proper steps to have the salary now paid you by the Government, namely, $4,000.00 per year, increased to $5,000.00 per year, and shall make every effort to expedite a decision on the point of allowing you this increase.

"Yours very truly,
"J. GILMORE FLETCHER,
"Chief of Aircraft Procurement."

Mr. Wickliffe immediately requested Mr. Huddleston to discontinue the payments, and accordingly there has been no payment of additional compensation since the payment for the month of July.

Early in February, 1918, arrangements were made with some of the manufacturers for the taking over of certain mahogany which has been under contract for delivery to British merchants, but the amount was relatively small. After H. K. S. Williams took charge of the Hardwood Section, and also after J. C. Wickliffe became his assistant, negotiations were continued with the manufacturers composing the Mahogany Manufacturers and Importers Association for the purchase by the Government of mahogany in large quantity for propeller stock. On the appointment of H. K. S. Williams, his brother, Thomas Williams (of Ichabod T. Williams and Sons) had resigned as President of the Association, and C. R. Mengel was elected in his stead. On February 14, 1918, new specifications had been adopted by the Signal Corps (No. 15,028-A) modifying and liberalizing the prior specifications which had been adopted in the previous December. At about the same time (February 13th) the manufacturers had submitted two proposals, one under the Signal Corps specifications (No. 15,028-A) at $400 per M feet for firsts, seconds, and selects, and $320 per M. feet for lower grades, f. o. b. cars eastern mills (with corresponding prices for other points according to estimated freight rates), and another proposal under the 'National Hardwood' rules for specified sizes at $350 per M feet for firsts, seconds, and selects, and $280 per M feet for No. 1 common, f. o. b. cars eastern mills. These had been refused. The important difference was with respect to the inspection.

In this situation, a conference was held on March 6th between the manufacturers and H. K. S. Williams, J. C. Wickliffe, and S. B. Vrooman, Jr., representing the Government. The minutes of this conference show that H. K. S. Williams opened the meeting with the announcement that "it was the purpose of the Signal Corps to grant as liberal an inspection as could be given consistent, of course, with the principle that no lumber could be taken that would not make propeller blades." After a discussion of the matter of utilizing lumber which showed scattered pin-worm holes, and the opinion having been expressed by Mr. Vrooman that such stock could be used where it did affect the strength of the board, Mr. Williams stated that he would endeavor to have the Inspection Department accept such lumber. This as Mr. Wickliffe testifies, was accomplished. The minutes show that Mr. Williams "stated that Mr. Vrooman is going to be in charge of the inspection all over the country; that he will appoint various men to do the inspecting at the various mills, and shall show them what is to be done. Mr. Williams further stated that his object in having Mr. Vrooman at this conference was that "the interpretation of the Signal Corps specifications might be as easy as such interpretation could be made consistent with the principle of accepting only propeller material but that the Government might get all such material that it could get." Mr. Williams then requested that each manufacturer advise him of the cost of its logs placed alongside steamer at Central American and Mexican loading points, and these estimates were given.



Another conference was held on the same day between the manufacturers and H. K. S. Williams and J. C. Wickliffe, representing the Government, at which, after considerable discussion, Mr. Williams stated that he would recommend the payment by the Government of the following scale of prices on Mexican and Central American mahogany propeller stock under Signal Corps specifications No. 15,028-A, as follows: $350 per M. feet for first, seconds and selects, and $280 for lower grades, f.o.b. eastern and middle western points, and $330 and $265, respectively, at New Orleans; and the same schedule of prices was stated for African mahogany f.o.b. eastern and middle western points. At these conferences Mr. Wickliffe was in attendance as Mr. Williams' adviser. He reviewed the manufacturers' estimates and made calculations for Mr. Williams as to costs, and in view of his extensive experience there can be no doubt that considerable reliance was placed upon his opinion and advice. The terms of the contracts were virtually settled, in accordance with Mr. Williams' proposal, at the second conference on March 6th, and these terms were subsequently approved by Mr. Lockhart. The formal contracts were not made until sometime later. On March 26th the Aircraft Board recommended the execution of the contracts, on the above terms for the following quantities:

For African mahogany:	Minimum	Maximum
Astoria Veneer Mills Dock Co.	2,000,000	3,500,000
I. T. Williams & Sons	500,000	1,500,000
Palmer & Parker Company	600,000	1,500,000
C. C. Mengel & Bro. Company	2,800,000*	2,800,000

*Amended to read 1,700,000 minimum.

Talge Mahogany Company	2,130,000	2,450,000

FOREIGN NEWS

Marconi Company to Supply Wireless Passenger and Mail Aeroplanes

LONDON.—Godfrey Isaacs announced December 18 that the Marconi Company would outfit aeroplanes employed in air passenger and mail service with wireless and would supply operators in the same way as it now serves ships. It also is intended to receive regular reports of air conditions in different localities and to circulate these for the information of the pilots. As every aeroplane will have either a name or distinguishing number, it will be possible to send telegrams from any part of the world or from any ship to an aeroplane. It is intended that this organization will be ready by the time the peace treaty is signed.

Arrangements recently have been made for the erection of wireless stations in the extreme parts of China, one on the frontier of Cashmere and another on the Chinese side of Siberia. Mr. Isaacs has arranged with Handley Page for the transport of the necessary machinery by one or more of his big machines. The journey inland will take two or three days in place of the same number of months.

583 Bombs Dropped in Paris Air Raids

PARIS.—Figures are now made public regarding the air raids and long range cannon bombardment of Paris, exclusive of the suburbs. In 1914 forty-five bombs were dropped; in 1916, seventy, sixty-two of them March 20; in 1915, sixty-one and in 1917, eleven. During the last ten months of the war there were 1,211 casualties from 395 bombs. The total number of bombs dropped was 583.

Aeroplanes and Zeppelins dropped 228 bombs August 6, killing two persons and injuring 392.

Gen. Rhodes Out Soon

PARIS, Dec. 25.—The condition of Major General Charles D. Rhodes, head of the American Armistice Commission, who was injured in the fall of an aeroplane near Paris on Monday, continued to show improvement today. Unless unforeseen complications occur his complete recovery may be expected shortly.

British Air Force Merged in Army

LONDON, Dec. 13.—The Daily Express understands that Lord Weir has resigned his position of Secretary of State for the Air Forces. The Royal Air Force will cease to rank with the navy and army as a separate organization, and will in future be administered by the War Office as a branch of the army.

Framing Rules for Peace Flying

LONDON, Dec. 18.—The civil aerial transport committee has rejected the ancient claim that the owner of the soil has a right to the air above that soil. Without the repeal of that right the development of peace time flying would hardly be feasible.

It will be necessary in the future to frame air road rules and to make traffic regulations for the sake of public safety and the protection of the national interests. When the rules of the air road are compiled, the experience of the flying men will be found of value. The regulations for "taking off," and matters as to precedence, pace, and landing will have to be observed if accidents are to be avoided. The rules in existence as to doing stunts and low flying will probably be enforced. That different kinds of traffic will be directed to travel at different altitudes is a foregone conclusion. Aircraft meeting or overtaking each other will be ordered to allow a wide margin of safety.

It is possible that captive balloons containing air police may be stationed at specially selected spots. To the balloons may be attached sign posts giving directions as to distances to various places and fog horns in case of mist. Wireless telephones lighted at night as are lighthouses would guide the night fliers. Perhaps the cables of the balloons would be illuminated at intervals. The possibility of huge floating landing stages at which a machine could land or could be moored for making minor adjustments and repairs or refueling are not remote.

Will Confer On Air Rules

PARIS.—Representatives of several Allied powers and the United States will hold a conference in Paris early this year to consider the future of international aerial navigation, the *Echo de Paris* announced. Great Britain, Italy, Belgium, France and the United States will be represented at the conference, which will study the questions of how to prevent aeroplanes of different nationalities from crossing customs barriers and how to prevent postal or commercial aeroplanes from being transformed into bombing machines within a few minutes.

The result of the deliberations of the conference, the paper adds, will have to be accepted by Germany and her former allies in the peace treaty.

War Profiteers Use Aeroplanes to Take Booty Out of Germany

MUNICH, Dec. 26.—An Associated Press dispatch says that the *Munich Post* today prints a statement that German war profiteers, unable otherwise to get their booty out of the country, have resorted to the use of aeroplanes.

According to the newspaper, several aeroplanes have taken securities of enormous value from Frankfort to Switzerland.

The *Post* urges the government to seize capital where it is available, especially in banks.

3,950 Mile Air Flight Ends

LONDON, Dec. 19.—The Air Ministry announces the landing at Calcutta of Major-General Salmon, whose flight from Cairo to Delhi in a Handley Page machine was announced on December 13. This aeroplane previously had been flown in England and took an active part in the final operation against the Turks on the Palestine front.

The total distance of the route from Cairo to Calcutta, via Damascus, Bagdad, Bushire, Bandar Abbas, Charbas and Karachi, is about 3,950 miles, the last stage, from Delhi to Calcutta, measuring 750 miles.

The Handley Page machine "Carthusian," piloted by Major MacLaren, in which General MacEwen is flying from London to India, has reached Pisa.

DELHI, INDIA, Dec. 20 (delayed).—The time occupied in actual flying by the Handley Page aeroplane from Cairo to Delhi was 47 hours 21 minutes for a distance of 3,233 miles, according to a special dispatch to the New York *Sun*. The longest stage of the flight was from Damascus to Bagdad, which was 495 miles, and occupied 6 hours and 53 minutes. The next longest was from Karachi to Nasirabad, a distance of 485 miles, which was made in 6 hours and 35 minutes.

A curious incident occurred when a rat came on board at Charbar and was heard nibbling at the machinery. The animal's career was terminated by falling out of the plane at a height of 7,000 feet above the sand of the desert.

Conversion of War Aircraft

LONDON.—The attention of experts is now focused upon the matter of the conversion of war aircraft for mail and passenger carrying purposes. Once the impediment of war bombs, racks, guns, fittings, and other parts is shed, it is obvious that a large amount of lifting power will be released for passenger carrying, and that plenty of space will be left for comfortable accommodations.

Little is said, however, of the possibilities of the seaplane or the flying boat as a pleasure craft. Either the seaplane or the flying boat is capable of holding from six to a dozen people. It could be purchased and run at a far less cost than a modern yacht for cruising around the coast.

Americans Get Sixty Aircraft from Germans

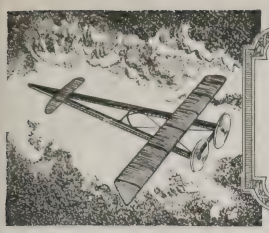
COBLENZ, Dec. 27.—Sixty aeroplanes of the Fokker type arrived in Coblenz today by special train from Berlin. They were the first of 200 aeroplanes which are to be turned over to the American forces in Coblenz in accordance with the armistice.

Each machine occupied a flat car and a German soldier guarded each car. A number of German aviators also arrived to try out one out of each twenty machines before the planes are turned over to the American commission. The planes for the test will be selected by the Americans and the Germans will make the flights to show that the machines are in good condition. The flights will take place near Coblenz in the presence of American officers.

Slayer of Quentin Roosevelt Found

WITH THE AMERICAN ARMY OF OCCUPATION, Dec. 28.—Christian Donhauser, a youthful German aviator, who claims to have defeated Lieutenant Quentin Roosevelt, son of Colonel Theodore Roosevelt, in the fight in the air in the region of Chamery, which resulted in the death of young Roosevelt, today told the correspondent that the day following the combat his commander informed him the American he had downed was Roosevelt. Immediately afterward German aviators began arranging the details for the funeral of Lieutenant Roosevelt.

Before the war Donhauser was an aviator, although now he is only 23 years old. He is the smallest of the German aviators, weighing only 94 pounds. Soon after the war began he entered the service as an observer, serving on various fronts, but principally on those in France and Belgium. He began pursuit flying July 1, and between that time and the day the armistice was signed he had to his credit thirty planes downed. He wears the Iron Cross and other German decorations. The aviator is credited with twelve planes downed in eleven consecutive days.



Donhauser's home is Hamburg, but before the war he spent several years in London. Although still in the German army Donhauser is planning a trip to the United States. Furthermore, he says he hopes eventually to take out American citizenship papers and join the American aviation forces.

Norway Enters New Industry

As has been the case in most countries, the efforts which industry has made in Norway to help itself and become independent of foreign markets have had great results. One of the main centers of this great industrial revolution is the district around "Sognefjorden," with its 100-mile water basin. During the past two years a new Norwegian industrial city has been built here. . When all the new plants are running normally they will be Europe's largest aluminum producers.

A piece of 2½ x 1" ash is stretched from the apex of the "V's" and acts as a compression strut when the bracing wires are drawn tight. The wheels are set 4 feet apart, the thickness of the axle being determined by the size of the hubs of the wheels.

Four plates are fastened to the apex of the "V's" of the landing chassis. These plates are made of 3/32" steel sheet. The slot is for free movements of the axle up and down.

THE motor is the most important part of the aeroplane, and we should be sure to have it work perfectly before installing it in our machine. To do this it is necessary to give the engine a good block test before using it.

It does not matter how old the motor is, in fact, the older Fords were made lighter in weight.

If we select an old motor, the first thing we must do is to re-bore the cylinders to make them perfectly round. It is not necessary to bore them out much larger than they are now, only get the scratches, scores, or pits out of the walls. If the reader cannot do this work, or if he does not think he could do a good job, I would advise sending the motor block to some good machine shop and have the work done right.

When the cylinders are finished, Alluminium Alloy Pistons should be fitted in place of the other old cast iron pistons. These pistons can be purchased from The Walker M. Levitt Company, 415 East 23rd Street, New York City, and they sell for $24.00 per set. The pistons weigh 15 oz. each.

The valve seats should next be inspected, and if they show any roughness or unevenness they should be ground and new valves fitted.

The connecting rods must be lightened by drilling holes of different sizes, small holes through the smaller section and larger holes through the larger section. When holes are drilled, the rods should be weighed and balanced. Some rods weigh a few ounces more than others. In this case it is necessary to grind the burr off the side of the heaviest rods until the weight is equal to the smaller ones.

The bearings of the connecting rods should be in perfect condition, and if necessary new bearings fitted.

The crankshaft must be trued up and the crankshaft bearings adjusted. It is necessary to cut the front bearing away on the outside as well as the small gear on the crankshaft. This is done to enable us to get a thrust bearing in between the pinion gear and the bearings to take the pull of the propeller when in flight. The space necessary is ⅝", and a two piece ball thrust bearing of light weight can be used. This can be purchased from any auto supply house.

Four 3/16" holes should be bored in the crankcase at points exactly in the center of the line of crank throw travel. These holes are made in order to allow us to run a force oil line to these points.

The oil pump can be purchased from the M. L. Oberdorfer Brass Company, 154 Nassau Street, New York City, represented by Mr. M. M. Rountree, who sell a very powerful and light gear pump. The pump only weighing one and a quarter pounds. This is attached to the front of the motor and is connected directly to the bottom of the crankcase. This allows the pump to be primed out at all times. The outlet consists of a piece of 3/16" O. D. copper tube with branches solder with silver solder. These branches are four in number and are inserted into the holes in the crankcase, to allow the oil to squirt on the bearings.

A new oil retainer must be made because we must cut off the fly wheel transmission, etc., from the rest of the motor. This eliminates the bottom of the oil crankcase, and, of course, a new one must be made from heavy aluminium. The cover plate for the timing gears must be made from aluminium also.

When the fly wheel is removed, we will find a flange at the end of the crankshaft. It is necessary to have a hub made to the same size of the flange, with an extension and a hub for the propeller fastened to it. This should be done at a good machine shop.

A Zenith Carburetor should be fitted to the engine. The Zenith Company makes an aluminium manifold which is very light, and the whole combination presents a very good looking job.

The valves should be timed late, that is, set the inlet valve of No. 1 cylinder to start opening just as the piston reaches a point of ⅛" below top center on its down stroke.

The water outlet in the head of the motor must be changed around because the motor is now turned in the opposite directions. It is necessary to plane off the old outlet and weld on a flat iron plate, or to close up the opening with a plate. Then weld an elbow into the outlet facing the reverse to what it does now. The inlet to the motor block from the radiator must be changed as well.

A scale model of the British F E 8 Pusher. This model was constructed of wood and it has a small rotary motor and a four bladed propeller

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

An Aviator's Alphabet

A—is the air man who looped the Hun-guffin,
For his own pleasure. (He is now in his coffin.)
B—is the batman who dirties the quarter,
Ruins our boots, and forgets our hot water.
C—is the Castor the rotaries use,
It bucks up both engines and humans—excuse.
D—is the drift, if you land with it on,
You will, almost at once, realize you are wrong.
E—is the engine which causes the motion
Which gives you the lift (not caused by promotion).
F—is the fairy you love with a pash,
She is sure to be there on the day that you crash.
G—is the gas which makes things go roun',
And sometimes does not, in which case you come down.
H—is the hangar one greets with such smiles,
On return from a run of some ninety-odd miles.
I—is the incidence out on each plane,
From which you get lift, I need hardly explain.
J—is the joy-stick—I mean control lever—
Which the Hun always clings to, as if in a fever.
K—is keel surface, it stops you from spinning,
Perhaps, if you know when the spin is beginning.
L—is the loop you're intending to do,
If the wind will do down, and the sky get blue.
M—is the man who keeps crashing on landing,
Why he flattens out, passes all understanding.
N—is the nacelle of a fast pusher scout
Twixt you and the earth, if you crash there is naught.
O—is hot oil, when it gets in your eyes
You will surely wear goggles at last and be wise.
P—is the prop which makes sticks which are sold,
It has other uses as well, I am told.
Q—is for Quirk, a machine of stability,
Of peculiar design, but unbounded utility.
R—is R. A. F., who designed a machine,
And an engine as well, such as never was seen.
S—is for stunting, if down near the ground
It is stupid and silly and grossly unsound.
T—is the tarmat I stand on all day,
And hope for a chair in an optimist's way.
U—is the union of pipe and of tank,
When the union gave out the aeroplane sank
V—is the vickers gun, gruesome affair,
Used to wind up the Hun in the air.
W—is wash-out and wash-in as well.
Their meaning's a secret I hardly can tell.
X—is the pilot, whose glory and fame
We'll remember in England, tho we don't know his name.
Y—is the yell of a man (or its echo)
When this engine's gone dud on a long-distance recco.
Z—is the letters of letters, my friend,
It involves the word Zeppelin (this is the end).

—The Aeroplane.

Real Grit!

Pullman Attendant (*to sleeping aviator home from the front on short leave*): "Reading, sir!"

Bungling Buglers!

The Eleventh June replacement detachment has a pup named Reveille and a cat named Retreat. Reveille gets 'em up on time and Retreat sounds for mess. The men call for Reveille, which is something out of the ordinary. Retreat sounds after taps. When Retreat and Reveille come together Reveille follows Retreat.

Oh, Hollow Fame!

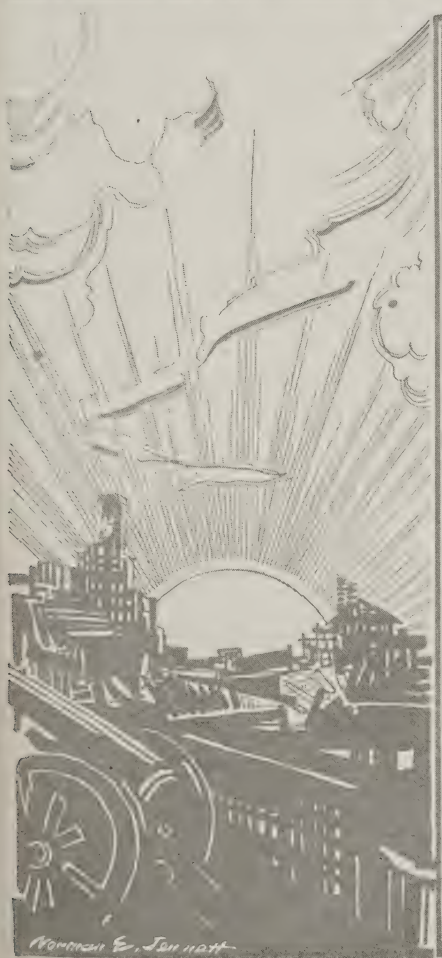
Lieut. S. B. Jacobson who heads the Kelly Field players was enjoying a production which he assisted in producing, and which was being shown at the Knights of Columbus hall. A rookie liked the show but was disturbed by a ray of sunlight which came through a window.

"Hey Kid," yelled the rookie to the officer, "pull down the shade."

Lieut. Jacobson complied with the request, and as he rose the loud-voiced recruit noticed the gold bars and the leather leggins. The soldier reduced himself to his minimum size and slunk out of sight.—*Kelly Field Eagle.*

OUI, THIS IS FRANCE

By "Alex"



An After-War Type

This new machine is built especially for commercial and sporting use by the Aircraft Engineering Corporation, New York. It is a small plane of sturdy construction and handsomely finished. Low first cost and low up-keep. It is Valsparred.

VALENTINE'S
VALSPAR
The Varnish That Won't Turn White

The Airplanes of Peace are Valsparred—

In the air-fleets of America and the Allies throughout the war Valspar proved its supremacy as the most reliable and durable varnish for the wood, metal and fabric of airplanes and seaplanes.

With the coming of peace the development of the flying machine takes another turn, and Valspar is again the chosen varnish of the leading manufacturers.

Many new types of planes, one of the latest of which is shown here, are being produced. They are Valsparred of course.

Valspar is proof against all kinds of exposure to water, air, sun, mud and dust, and also against the terrific vibration of air service. It won't turn white under the severest conditions. It resists oil and gasoline, acids and alkalies. It is a long-oil varnish of exceptional brilliancy and drying qualities and retains its elasticity long after ordinary varnishes have perished.

We invite you to make your own tests. Our Airplane Service Department will gladly give you every possible assistance and information. To Purchasing Agents and Superintendents of Production, we will send our valuable book on airplane varnishing, free on request.

The Hughes Aircraft Report

(*Continued from page* 865)

For Central American and Mexican mahogany:

	Minimum	Maximum
Huddleston & Marsh Mahogany Co.	1,750,000	3,000,000
Astoria Veneer Mills & Dock Co.	1,500,000	2,500,000
Lewis Thompson & Company	1,500,000	2,000,000
Otis Manufacturing Company	1,000,000	2,000,000
Frieburg Lumber Company	500,000	1,250,000
I. T. Williams & Sons	750,000	2,000,000
Palmer & Parker Company	300,000	750,000
C. C. Mengel & Brother	2,800,000	2,800,000

On April 16, the Aircraft Board recommended the making of a contract with the S. B. Vrooman Company for Central American or Mexican mahogany, 500,000 feet, minimum and 1,500,000 maximum.

It is hardly necessary to say that it was a gross impropriety for corporations or firms, either individually or collectively, to pay additional compensation to an employee of the Government, and for the employee to receive such compensation, for services in relation to contracts and transactions in which the corporations or firms were directly and pecuniarily interested. It is not found, however, that there is any statute making this a criminal offense unless it is a case within the statute against bribery, or proves to be part of a fraudulent scheme to take advantage of the Government, or part of an endeavor to induce a violation of law.

The Act of March 3, 1917 (*ante,* p. 25) making it a crime to pay additional compensation to an employee of the Government, or for an employee to receive such additional compensation, only applies to such contributions after July 1, 1919. The occasion of this statute, it is understood, was criticism of payments of additional compensation made to experts in the employ of the Government, where, however, the employee in the Government service was not acting in matters in which the person or corporation contributing had any pecuniary interest or motive of gain. Contributions for the support of those who have made sacrifices in undertaking war work for the Government are doubtless made in many instances, but there is no analogy between cases of this general description and payments of additional compensation to employees of the Government by those having direct pecuniary interest in the transactions in which the employee acts as the Government's agent. But under the statute against bribery (Criminal Code, Secs. 39, 117) it must be proved that the payment was made or received with intent to influence the decision or action of the representative of the Government on a question which may be brought before him in his official capacity or in his place of trust or profit, or to influence him to commit, aid, collude in or allow a fraud, or to make opportunity for the commission of a fraud, on the United States, or to induce the employee to do or omit to do an act in violation of his lawful duty. Whether in the present case, in the circumstances disclosed, any charge of this sort could properly be made would largely depend upon the question whether the terms and prices secured by the mahogany manufacturers were fair and reasonable, or could be deemed excessive and the result of improper influence. In view of the intimate relation of the representatives of the Government, who took part in the negotiations, to the manufacturers, it is obviously appropriate that there should be a fair and impartial examination of the transactions by a body competent to make a survey and determination of questions of costs and profits. Testimony has been given in the present inquiry tending to show that the prices were high. Lower prices under prior orders and offers are referred to. On the other hand, the manufacturs urge that in view of the peculiar conditions of the industry, the difficulties attending the procurement of logs, and the risks taken by reason of the small percentage of lumber suitable for propeller material, the prices and terms were in all respects fair; that Mr. Williams, Mr. Wickliffe, Mr. Vrooman and Mr. McCullough took their positions simply because of the necessity of having men in their respective places who were qualified by experience, and that throughout the transactions all the persons concerned have been moved solely by the desire to serve the Government. It was manifestly impossible in the course of the present inquiry to make such a survey of the mahogany industry as to reach a satisfactory conclusion with respect to the cost of producing the required mahogany and as to the fairness of prices and terms. This sort of investigation would require special facilities of the kind which are at the command of the Federal Trade Commission, and through its instrumentality it is believed that such a survey of the industry and a determination of fair costs and profits can be made. Upon its report as to the cost of producing the required mahogany it can readily be decided whether there is ground for prosecution by reason of the transactions which have been disclosed in this inquiry.

(*To be concluded*)

(*Continued from page* 850)

(3) To send up sounding balloons and explore the upper air of the Polar regions, gathering meteorological data.

Captain Bartlett gave further details of the work of his expedition as follows:

"Over 1,000,000 square miles of territory in the center of the Polar Basin still remain to be explored, and it is quite possible that we will find land in that region.

"During a period of time in the summer it is so warm that snow and ice disappear entirely in the sub-Arctic regions. I have a number of photographs which I took at Etah during my last expedition which shows that there was no snow left even on the Rookeries near Etah, where such birds as the Auks and Loons nest. The photograph of Cape Alexander, the Gateway of the Arctic, and Cape York, North Greenland, show that there was no snow left.

"It is hard to make people believe that there is a period of time in the Arctic regions when the weather is warm and there is vegetation. We picked flowers on some of our expeditions about 400 miles from the North Pole. But the warm weather only lasts for about two months, and ships are handicapped through the ice further north and are usually caught in the ice in the returning cold weather before we can get very far. With the aeroplane it is different. We can cover a good deal of ground in a very short time, and we can land on established bases at different points from which to make soundings to get data from the bottom of the Polar Basin as well as from the upper air, to ascertain the direction of air currents and other meteorological data."

132 Army Fliers Released

San Diego, Cal.—Orders authorizing the discharge of 132 aviators and ground officers attached to Rockwell, Ream and East fields, were received December 26.

One of those to leave the service is Lieutenant William Wellman, of Boston, American ace in the Lafayette Escadrille.

Army Aerial Squadron Turn Southward Again

The War Department authorizes the following:

The four training planes coming east from San Diego, Cal., which reached Eufaula, Ala., from Montgomery, Ala., have turned south again headed for Florida. They were given permission to come to Washington, D. C., but requested that they be allowed to fly through Florida before coming north, and this consent being secured by wire, they started for Jacksonville. From there they will proceed to Arcadia. By reaching Jacksonville they will have completed a transcontinental flight, the first on record for formation flying.

None of these planes carries more than an hour and a half's supply of gasoline, being the planes in which cadets are taught to fly. They left the Pacific coast on December 4, each carrying two men, and have come steadily east in hops of one and one-half hour each, mapping the country as they went along for the purpose of laying out a southern transcontinental air route.

Y. M. C. A. Uses Aeroplanes as Secretarial Jitneys

Wash., D. C.—Y. M. C. A. secretaries who help supervise association work at a "down river" camp, have found a way of avoiding bad roads. They go in aeroplanes.

Upon invitation of the Navy Department, Charles N. Ramsey, in charge of personnel, and Ralph I. Hickok, religious work director, went in an aeroplane to Mackadoc, the lower station of the naval proving ground, about forty-five miles down the Potomac from Washington.

The secretaries made a survey preliminary to starting Y. M. C. A. work at that point where there now are about 200 men. They were the guests of Lieutenant Caldwell and Lieutenant W. J. Lee.

The "down river" trip took fifty-three minutes, and one hour and five minutes was required for the return trip.

Photo Section News

During the week the Photographic Branch of the Training Section reported that a mosaic containing 4,200 prints had been completed of Fort Sill. The whole map measures 8 by 16 feet. Mosaic maps of Venice were recently received from the Italian Mission.

There were on December 21, a total of 482 cadets attending the protographic schools at Cornell and Rochester.

Air Service in Santa Role

Some sixty wounded soldiers stationed in Washington were made happy on Christmas by the donations of the officers and employees of the D.M.A. and the B.A.P., amounting to $210.68.

Christmas morning an Army truck laden with sixty well-stuffed Christmas stocks, and packages of tobacco, books, fruit, candy, note paper and a dozen other things, as well as twenty-five out of town, and more or less lonesome girls, drew up at Wards 1, 2, 3 and 4 at Walter Reed Hospital, and Christmas for the boys confined to their cots began in earnest.

This little Christmas party was made possible by the activities of Mrs. E. R. Boughton, of the Finance Branch of the D.M.A., mother of Captain W. E. Boughton of Camp McClellan. Mrs. Boughton herself collected the money, and it is interesting to know that while she only asked for nickels, quarters, halves and even dollars were donated by the Air Service for use in this worthy project.

Major Peterson Returns

Major David McK. Peterson, A. S., A, Junior Military Aviator, and formerly of the 94th Aero Squadron, with a fine record behind him in the Lafayette Escadrille, returned from overseas in November. Major Peterson was detailed in the Training Branch of the D.M.A., and was recently transferred to Dorr Field, as Officer in Charge of Flying. Major Peterson's home is in Honesdale, Pa. He has received the American Distinguished Cross and an Oak Leaf, and some French decorations for his service overseas.

D. M. A. Board on Peace Times Organization

The Board appointed by the Director of Military Aeronautics to work out a Peace Times Organzation for the Air Service has announced its personnel and the functions of its Sub-Boards to be as follows:

Board of Organization

Colonel C. G. Edgar, Colonel F. R. Kenney, Colonel A. Woods, Major E. Hubert Litchfield, Recorder.

Operating under this Board are the following Sub-Boards:

Demobilization of the Division of Military Aeronautics

Lt. Colonel George B. Hunter, Chairman; Lt. Colonel Rush B. Lincoln, Major Walter George Rogers.

Air Service Operations in Peace Times

Colonel William E. Gillmore, Chairman: Colonel Gerald C. Brant, Lt. Colonel Thomas Duncan, Lt. Colonel Barton K. Yount, Lt. Colonel Colonel Ira Longanecker, Lt. Colonel Benjamin F. Castle, Captain John W. Davis.

Mustering Out

Major E. Hubert Litchfield, Chairman; Lt. J. J. O'Brien.

Committee on Training

Colonel Milton F. Davis, Chairman; Lt. Colonel John Armstrong Drexel, Lt. Colonel Seth W. Cook, Major William A. Robertson, Professor Edward L. Thorndike.

Invention and Research

Captain Adelbert Ames, Jr., Chairman; Captain Robert R. McMath, Professor Wallace C. Sabine.

Supply

Lt. Colonel Thomas G. Gallagher, Chairman: Lt. Colonel Harold Bennington, Major C. S. Benton, Major Walter G. Rogers, Major Eugene E. Deacon, Major Harold R. Eyrich, Captain David R. Wheeler.

Demobilization

The Officer in Charge of Demobilization announces recently that reports from all Air Service activities show the following preferences on the part of the personnel, both commissioned and enlisted:

One-eighth request complete separation from the Service.

Three-eighths request to enter the Regular Army.

One-half request to enter the Reserve Corps.

Here It Is—The Practical Aeroplane

READY FOR IMMEDIATE DELIVERY

Designed for civilian use—for the man who rides his ranch, and the man who loves the air—regardless of the business that calls him.

Low in Cost of Upkeep

High in Factor of Safety

AVIATOR

One of the best known pilots in the country, at present employed by large corporation as chief test pilot and instructor, desires connection with reliable people who expect to expand and open branches in foreign countries, particularly South America. This pilot holds International Aero Club license and has been one of the most popular exhibition aviators for the past six years. Expert test pilot on Curtiss, Dep, Stick, Nieuport and Three-in-One controls, tractor and pusher land and sea planes. Excellent executive ability, good education and expert rotary motor engineer; familiar with all latest types of motors and machines. MUST BE A PERMANENT POSITION WITH A RELIABLE CONCERN.

The Pledge on the Post Office Portico

"Neither snow nor rain nor hail nor gloom of night shall stop these couriers from the swift completion of their appointed rounds."

This is the promise carved on the portico of the New York Post Office—a promise that has become fact in the case of the air-mail as it is in the case of other postal departments.

For months the six airplanes, specially designed and built by the Standard Aircraft Corporation, have carried the mail between New York and Washington with a regularity equaling, if not surpassing, that of the railroads.

Truly a new era in transportation is at hand.

"SERVICE"

"NORMA" PRECISION BALL BEARINGS

(PATENTED)

In any machine, maximum serviceability can be had only when each link in the chain from power to performance has a capacity for its functions ample for every emergency. A consistent factor of safety must obtain throughout. And it is not unusual to find that a very inconspicuous part bears a tremendous burden of responsibility—may, by its failure, cripple the whole mechanism.

The bearings in ignition apparatus and lighting generator of an airplane, car, truck, tractor or power boat are vital to the machine's performance—can make or mar its record. Therefore, builders of dependable electrical apparatus, knowing "NORMA" dependability in speed service, have standardized on "NORMA" Ball Bearings.

Be SURE. See that your Electrical Apparatus is "NORMA" Equipped.

VOL. VIII NEW YORK, JANUARY, 13, 1919 NO. 18

THEODORE ROOSEVELT

IN the death of Theodore Roosevelt the world has lost its greatest personality and the United States its greatest leader.

The Colonel died at Oyster Bay, New York, at 4:15 A. M. on January 6, of pulmonary embolism, blood clot in one of the arteries of the lungs.

Alan R. Hawley, President of the Aero Club of America, Tells of Colonel Roosevelt's Pioneer Contributions to the Development of Aeronautics

"The death of Colonel Roosevelt deprives the aeronautic movement of one of its strongest supporters," said Mr. Alan R. Hawley, the President of the Aero Club of America.

"The Colonel's support to aeronautics began in 1897, when he was Assistant Secretary of the Navy and by his energetic efforts in Congress secured the appropriations needed by Professor Langley to continue his experiments.

"It was during the Roosevelt Administration in 1907, that the United States Army ordered the first aeroplane and first dirigible. At that time no other country had aeroplanes, therefore this progressive step gave to the United States the distinction of being the first Nation to give aeroplanes to its Army.

"The Colonel supported his belief in the safety of flying by making flights himself. He made his first flight in St. Louis in 1911, when very few people dared to fly, because the idea of flying was so new. He flew a number of times later and was the first person of national importance to go up in an aeroplane equipped with a Liberty motor.

"In 1915, at a Conference held on board Mr. Harry Payne Whitney's yacht "The Whileaway," he told the members of the Board of Governors present, who were Messrs. Henry A. Wise Wood, Robert J. Collier, Henry Woodhouse, and myself, that he believed that aircraft would be the most effective weapon in case of war, and urged haste in training two thousand aviators.

"At that time there were only ten aviators in the Army and about eight in the Navy, and the very idea of preparing to train 2,000 aviators was laughed at in Washington. We all know now that had that been done, and had the United States been in a position to send even only 1,000 aviators to France when we entered the War, the war would have been won months before and tens of thousands of lives and billions of dollars would have been saved."

Colonel Roosevelt was also an Honorary Member of the Aerial League of America.

Notable Events in Roosevelt's Life

Oct. 27, 1858, born in New York city.

1880, was graduated from Harvard.

1881, elected to the New York Legislature as a regular Republican.

1882, 1883, reelected.

1886, as the Republican candidate for Mayor of New York he was defeated by Abram S. Hewitt.

1889, engaged in civil service reform work, being a member of the United States Civil Service Commission from 1889 to 1895.

In 1895 was made president of the New York police board.

1897, appointed Assistant Secretary of the Navy by President McKinley.

1898, after raising the Rough Riders regiment, the first volunteer regiment in the war with Spain, and after the victory of San Juan Hill, he was nominated by the Republican party for the Governorship of New York.

1900, nominated for Vice-President on the ticket with McKinley.

1901, succeeded to the Presidency on the assassination of William McKinley.

1904, elected President by the largest popular majority ever given to any candidate in any Presidential election.

March 23, 1908, sailed for Africa to make a scientific collection of fauna and flora of that continent's tropical regions.

June 18, 1910, after magnificent receptions by the peoples and rulers of Europe he returned to New York city and received a great national ovation.

1912, after campaigning in the May Presidential primaries he was defeated for the Republican nomination at Chicago, was subsequently nominated for President by the Progressive party, and in the campaign ran second to Woodrow Wilson.

May, 1913, won a complete victory in his suit against Editor George A. Newett of the Ishpeming, Mich., *Iron Ore*, who in the course of the 1912 campaign had accused him of drunkenness.

January, 1914, explores the River of Doubt in Brazil, which is afterward formally named the Rio Theodoro by the Brazilian Government.

May 22, 1915, the suit of William Barnes against Theodore Roosevelt on an allegation of crooked business and crooked politics resulted in a complete victory for Colonel Roosevelt.

July, 1916, defeated for the Republican Presidential nomination at Chicago, he refused to run on the Progressive ticket and supported Charles E. Hughes on the principle that America should have promptly resisted Germany when attacked by her on the seas.

1916 and 1917, active leadership on American patriotic issues. The Administration refused to permit him to complete raising his division for service in France. His four sons, Theodore, Archibald, Kermit and Quentin, go to fight in France, and his son-in-law, Dr. Richard Derby, goes to France as a Major in the Army Reserve Corps.

In 1918, assumed leadership of public opinion and demanded vigorous prosecution of the war and a 100 per cent. Americanism on the part of all citizens. Did not hesitate sharply to criticize Administration when he considered that its actions failed to measure up to requisite standards. Gave $40,000 Nobel Peace Prize he had received in recognition of the settlement of the Russo-Japanese War to war work, dividing fund between Red Cross, Y. M. C. A. and Knights of Columbus.

FOUR THOUSAND MILES IN FIFTY HOURS

FROM Rockwell Field, San Diego, Cal., to Bolling Field, Washington, via the Southern route, a distance of approximately 4,000 miles in fifty flying hours, is the record of the squadron of four army planes commanded by Major Albert D. Smith. This is an average of about eighty miles per flying hour.

With the exception of three stretches, covering 520 miles, the entire flight was made against a steady wind, which cut down the speed of the squadron materially.

The measured distance for the trip, taking the direct air line between all points at which stops were made, was 3,610 miles. It was not possible to take the direct air line between some points, and the detours made increased the distance covered by approximately 400 miles.

Accompanying Major Smith were Major James H. McKee, flight surgeon; Lieuts. Robert S. Worthington, H. D. McLean, Albert Pyle and John M. Evans, and two mechanics, Sergts. Blanton and Lewis, both master signal electricians.

"We made no attempt whatever to establish a speed record on this trip," said Major Smith to a reporter for the *World*. "We started out to map an aerial mail route between San Diego and El Paso, Tex., and were permitted to pick our own course from El Paso on.

"The course to El Paso was carefully mapped and landing places selected. Lieut. Evans is the official photographer of the party, and he took some fine pictures along the route. We also made photographs and notes covering the entire distance.

"We made the entire trip without changing a plane or a motor. The plan is to fly back to San Diego, and a start probably will be made about the middle of this month.

"Our motors have gone through sixty-five hours of actual flying and will be replaced by new motors for the trip home. We expect to use the same planes on the return journey.

"The entire distance from sea to sea and up the coast was covered in formation. For three solid weeks we were compelled to remain idle on account of bad weather."

The squadron left Rockwell Field on Dec. 4 and was on the road thirty-three days, or four weeks and five days.

In 1912 Col. Rogers flew from New York to Los Angeles for the purpose of advertising a certain product. He covered the distance in about forty days. The only other cross-country flight was made by a pilot named Fowler, who flew from Los Angeles to Jacksonville and spent about three months en route. He had a train along with him.

On the return trip the army flyers plan to make much better time. Their route has not yet been chosen, but it is probable weather conditions will require them to go back via the Southern route.

Major Smith brought the carcass of a young deer to Washington in his machine, and the party dined on venison at a local hotel. They shot six bucks near Tillman, S. C., where a stop was made. The flyers shot ducks near Phoenix, Ariz., wild pigs in Texas and quail in Florida.

There were no serious mishaps on the long journey and Major McKee had nothing to do but enjoy the ride and "patch holes in the air," to hear the flying men tell it. The aviators look none the worse for their long flight and are keen to take the air again for the journey to New York. A stop will be made in Philadelphia for fuel.

The planes are patched up and show signs of hard usage, but are said to be as strong as when they left Rockwell Field. At one time, while over the southwestern mountains, the two mechanics made repairs on the motors in the air. They climbed on top of the motors, and did their bit with the machines, cutting capers of all kinds.

The original squadron contained five planes, but the fifth pilot lost his way on the first lap of the journey. Major Smith modestly gives credit to the junior pilots for the success of the flight, but they insist he is entitled to 90 per cent. of it. The planes used were Curtiss J. N. 4 H.'s.

Just as AERIAL AGE goes to press we learn that the squadron of Army planes completed the trip across the continent and landed at Hazelhurst Field, Mineola, just as darkness fell January 7th.

AERIAL TRANSPORTATION COMMITTEE ORGANIZED BY THE AERO CLUB OF AMERICA

MR. ALAN R. HAWLEY, the President of the Aero Club of America, announced on January 6 the appointment of a committee of important members of the Club to develop plans for the employment of aircraft for transportation and the drafting of regulations to govern aerial navigation.

Rear-Admiral Robert E. Peary has been selected as Chairman of this important "Aerial Transportation Committee", of which the following prominent members of the club have been nominated to be members:

Col. Bion J. Arnold, Roger W. Babson, Sir F. W. Baillie, Major T. F. Baldwin, U. S. A., Bernard M. Baruch, Capt. R. A. Bartlett, Alexander Graham Bell, Major August Belmont, U. S. A., Laurence V. Benet, Walter Berry, Lieut. Commander P. N. L. Bellinger, U. S. N., Lieut. Commander W. Starling Burgess, U. S. N., James M. Beck, General Theodore A. Bingham, Lieut. Col. James A. Blair, Jr., William H. Bliss, Col. G. C. Brant, U. S. A., Rear Admiral Mark S. Bristol; Lieut. Col. A. R. Christie, Col. C. C. Culver, U. S. A., Lieut. Godfrey L. Cabot, U. S. N., Manuel Estrada Cabrera, President of Guatamala, Gianni M. E. Caproni, Col. Charles deF. Chandler, Edward B. Close, Alexander Smith Cochran, T. Jefferson Coolidge, J. Parke Channing, W. Redmond Cross, J. S. Cullinan, Glenn H. Curtiss, Capt. Bronson M. Cutting, Edgar B. Davis, Col. Milton F. Davis, U. S. A., H. P. Davison, James Deering, Charles Dickenson, Capt. Earl W. Dodge, Lieut. W. E. Doherty, U. S. N., Eben S. Draper, Irenee duPont, T. Coleman duPont, Brig.-Gen. Robert K. Evans, U. S. A., Rear-Admiral Bradley A. Fiske, Major Max Fleischmann, Col. A. F. Fuller, U. S. A., Major Robert Glendenning, Major Howard L. Goodhart, Major C. C. Goodrich, Major David M. Goodrich, Major Edwin Gould, Alan R. Hawley, William Hawley, John Hays Hammond, Jr., J. R. Harbeck, A. A. Harriman, Peter Cooper Hewett, Dr. A. L. Hipwell, W. S. Hogan, Lt. Col. F. L. V. Hoppin, Hon. Murray Hulbert, Col. H. B. Hersey, Prof. J. F. Haworth, Col. E. Lester Jones, Major-General W. A. Kenly, Major Fiorello H. La Guardia, Capt. B. B. Lipsner, Henry Lockhart, Jr., Capt. Pierre Lorrilard, Harold F. McCormick, Clarence H. Mackay, Emerson McMillan, Lord Northcliffe, Glenn L. Martin, Col. Archie Miller, U. S. A., Major J. C. McCoy; W. W. Miller, Harry Bowers Mingle, Wm. H. Page, Augustus Post, George W. Perkins, L. C. Phipps, Col. James Prentice, Major Cushman A. Rice, U. S. A., Prof. C. L. Poor, R. B. Price, N. G. Rost, Hon. William G. Sharp, Allan A. Ryan, Alberto Santos-Dumont, Herbert L. Satterlee, F. A. Seiberling, J. DeMont Thompson, Rodman Wanamaker, Lt. Col. Wm. Thaw, Brig. Gen. Cornelius Vanderbilt, W. K. Vanderbilt, G. Douglas Wardrop, Felix M. Warburg, Sidney B. Veit, Henry Woodhouse, Major Orville Wright, Harry Payne Whitney, John N. Willys, K. M. Turner.

"One of the purposes of the Aerial Transportation Committee," said Mr. Hawley, "will be to advise the representatives of scores of cities in the United States who are constantly applying to the Aero Club of America and the Aerial League of America for information, advice and guidance in establishing aerodromes.

"Another purpose will be to co-operate with the Post Office in establishing aerial mail lines and extending the aerial mail service.

"Preliminary reports on the subject of aerial transportation and regulations to govern aerial navigation have been made to the Board of Governors of the club and data has been collected showing what England, France and Italy are planning to do. These countries are planning most extensive air lines, although their geographic conditions are not as favorable for aerial transportation as they are in the United States. We should do likewise in this country and utilize the 20,000 Liberty motors which are being stored away and the tens of millions of dollars worth of aeroplanes which will be entirely wasted unless used during the coming six months, as aeronautic equipment deteriorates fast."

THE NEWS OF THE WEEK

Fly 215 Miles in 75 Minutes

Cleveland.—What is believed to be a new world's aeroplane speed record was set January 7 in a 215-mile flight from Dayton to Cleveland by Eric Springer, pilot, and Ernest Longchamp, mechanician, in a Martin bombing plane driven by two Liberty motors. The time was 1 hour and 15 minutes. The previous record between the two cities was two hours flat.

The machine carried gasoline, tools and baggage weighing 2,500 pounds. It was the first machine turned out by the Glenn L. Martin factory here and had been at Dayton for several months undergoing army tests. The flight was not intended as a speed test.

Kenly in Record Flight from Washington

Mineola.—What is said to be a record aeroplane flight from Washington to Mineola was made January 7 by Major General William L. Kenly, chief of the Department of Military Aeronautics, with Major William C. Ocker as pilot. The flight was made in a specially designed De Haviland aeroplane, equipped with a 400 h.p. Liberty motor. The 250 miles was covered in 1 hour and 39 minutes, which is an average of 160 miles an hour. The aeroplane landed at Hazlehurst Field.

Major Ocker said that he flew from Washington to Philadelphia in 55 minutes and from Philadelphia to New York in 44 minutes. No stop was made at Philadelphia. General Kenly and his pilot took a lunch of coffee and sandwiches in midair.

General Kenly said that he was very well pleased with the flight, but believes that an even better record will be made next time.

A Glenn L. Martin aeroplane, carrying five army officers, flew from Washington to Mineola in two hours on January 7. This aeroplane was equipped with two Liberty motors and was piloted by Captain Roy N. Francis. Those in the aeroplane were Lieutenant Colonel C. K. Rheinhardt, Major W. H. Frank, Lieutenant Ried F. Behan and Lieutenant Colonel Archie Miller.

British Flier Sets Record for Height

London.—The world's record for altitude for an aeroplane was broken at Martleshall, near Ipswich, recently by Capt. Lang, R. A. F., and Lieut. Blowers, the former acting as pilot, the latter being a passenger. The feat was accomplished on a British two-seater biplane fitted with a British-designed and British-built engine. At 2,000 feet there was 31½ degrees of frost. A height of 25,000 feet was reached in 38 minutes and 20 seconds, and the final barograph reading of 30,500 feet was made in 66 minutes and 55 seconds.

At 20,000 feet Lieut. Blowers turned on the oxygen supply, and 6,000 feet higher, feeling faint, he turned on his own supply an extra pound, but with no better result. He found that the main pipe connected with the oxygen bottle was broken through vibration. He wrote a note to the pilot telling him what happened, but collapsed before he could get the message to the pilot, who therefore carried on in ignorance of his observer's pligiat. At 28,000 feet the pilot's heating apparatus was working erratically, and at 29,000 feet the shortage of oxygen was apparent. The pilot, however, carried on till 30,500 feet was reached.

Here the engine stopped through lack of petrol. The pressure of the air at this height was so slight that it could not drive the small propellers connected with the petrol and oil pump.

Descending slowly, the machine got to 10,000 feet, where the observer regained consciousness. The observer was sent to a hospital suffering from frozen hands and toes. Capt. Lang was suffering from frostbite on his fingers and face.

Capt. R. W. Schroeder, an American pilot of the Wilbur Wright aviation field, held the altitude record just broken by Capt. Lang. He reached an altitude of 28,900 feet on September 18, 1918, which he made in a Hispano-Suiza motored Bristol Biplane.

"Gulf to Lakes" Flyers Triumph

Detroit.—An observation De Haviland aeroplane reached Detroit this afternoon from Ellington Field, Houston, Tex., making the 1,650 mile trip in 724 minutes of flying time and the last lap from Indianapolis at the rate of 122 miles an hour, under adverse weather conditions.

The machine was one of three which left Ellington Field on a "Gulf to Detroit and return" map making an observation trip, December 21, and was piloted by Capt. L. J. Robinson, with Lieut. A. A. Adams, observer.

Capt. Robinson made the flight under the direction of the Technical Department of the Engineering Corps for observation and to test the operation of the Liberty engine under severe weather conditions.

Capt. Robinson stated on his arrival here that the flights from St. Louis to Indianapolis, and from Indianapolis to Detroit, were made through weather and at continued low temperatures that it had hitherto been held could not be contended with. The Indianapolis-Detroit flight was made with temperatures ranging from zero to 10 below, but no engine or oil troubles were experienced, although no special engine equipment had been provided.

The two mapmaking machines, in charge of Lieut. Hill, are at Indianapolis awaiting weather favorable for mapmaking and reconnaissance.

Students of Walter E. Lees, Please Note

So that the *entente cordiale* existing between the students tutored by Walter E. Lees may be revived, the editors of AERIAL AGE are glad to state that communications addressed to Walter E. Lees, 54 West 37th Street, New York City, will be delivered promptly. Mr. Lees would also like to hear from his fellow instructors of the early days—that is, 1914 and 1915.

Bureau of Aircraft Production Changes

The following assignments of Aircraft Production officers is published:

Lieut. Col. R. M. Jones, A. S., A. P., was appointed Assistant and Executive Officer to the Acting Director of Aircraft Production on December 28. In addition to his present duties as Executive Officer, he will also be charged with such activities as pertain to laison, correspondence with the War Department and other Departments or Bureaus of the Government.

Lieut. Col. H. C. Clark, A. S., A. P., in addition to his other duties, will take over the duties of Adviser and Assistant to the Acting Department on matters pertaining to personnel for the Bureau.

Lieut. Col. O. Westover, A. S., S. P., is appointed Assistant to the Acting Director of Aircraft Production.

Major George F. Lyons, A. S., A. P., is hereby appointed Assistant to the Acting Director of Aircraft Production.

"On the Wing" Ceases Publication

It is regretted that the Puget Sound District of the Spruce Production Division, publishers of *On the Wing*, have announced the last issue of that interesting paper. It was conceived as a soldiers paper and published as such, without advertising, for seventeen weekly issues.

Hunting in Service Aeroplanes Forbidden

The Director of Military Aeronautics has ruled against the shooting of wild fowl with machine guns from aeroplanes.

"The shooting of wild fowl with machine guns from aeroplanes is absolutely forbidden. Aeroplanes will not be used in any manner for hunting or shooting wild fowl. Aeroplane flights along the coast, or at any place where migratory wild fowl may be found, will be conducted in such a manner as to interfere as little as possible with the habits and feeding of the wild fowl.

"Commanding Officers will use every means to carry out the regulations and will bring to trial any offenders that may in the future be guilty of breaking any of them."

Class II Flying

No more instruction known as "Class II Flying" will be given at Army Air Stations. All such instruction now being given will be discontinued by direction of Major General Kenly.

Air Service Units to Sail

The War Department announces that the following organizations have been assigned to early convoy:

Fourth Regiment Air Service:
Mechanics 17th Company, 3 officers and 161 men;
18th Company, 3 officers and 152 men.
19th Company, 1 officer and 168 men.
Air Service Casual Company No. 2; 2 officers and 185 men.
162nd Aero Squadron, 2 officers and 51 men.
400th Aero Squadron, 7 officers and 153 men.
34th Balloon Company, 11 officers and 170 men.
155th, 147th, 27th, and 95th Aero Squadrons, 24 officers and 725 men.
13th, 49th and 139th Aero Squadrons, 18 officers and 545 men.

The assignment of the 500th Aero Squadron to early convoy was an error.
483rd Aero Squadron, 4 officers and 154 men.
489th Aero Squadron, 4 officers and 154 men.
490th Aero Squadron, 4 officers and 154 men.
21st Aero Squadron, 5 officers and 152 men.
30th Aero Squadron, 5 officers and 134 men.

The Murray-Carns Biplane, one of the latest American machines. The fuselage is made of thin rolled steel. It is powered with a Hispano-Suiza motor © Central News

31st Aero Squadron, 5 officers and 150 men.
32nd Aero Squadron, 5 officers and 135 men.
33d Aero Squadron, 5 officers and 143 men.
37th Aero Squadron, 5 officers and 142 men.
640th Aero Squadron, 5 officers and 148 men.
43rd Aero Squadron, 4 officers and 155 men.
101st Aero Squadron, 4 officers and 150 men.
257th Aero Squadron, 4 officers and 154 men.
469th Aero Squadron, 2 officers and 116 men.
184th Aero Squadron, 2 officers and 147 men.
492nd Aero Squadron, 2 officers and 147 men.

Twenty-seven casual air service officers are reported as having sailed on the *Nieuw Amsterdam* on December 27, and 45 officers on the *Siboney* on December 25.

Marine Corps Aviators Return

Major A. A. Cunningham, commander of the United States Marine Aviation Corps, has just arrived here from France. With him came three squadrons of his foreign unit, numbering 115 officers and 700 men. His fourth squadron, with 180 men and 36 officers, returned two weeks ago.

Major Cunningham was made the first marine aviation officer in 1912, and for a time constituted the whole of the marine aviation section. He is extremely proud of the performance of his corps of air fighters.

Major Cunningham went to Europe in 1917 for the purpose of inspecting their methods of training fliers. He came back a few months later and put into effect the results of the aviation wrinkles observed abroad. The prime factor being a course of stringent training, and a few months later an organization of a thousand men were started for France. For the efficiency of his corps Major Cunningham was highly commended by the major general commanding. Major Cunningham says of his "boys": "Our men who went over were trained for a year and a half, and they were picked from hundreds of good men. They jumped into the thickest of battles from the first and stayed right with the oldest and best of the allied fliers. Some of their individual deeds of bravery will go down in history."

They were in France but four months, but saw service to the very day the armistice was signed. Their losses total eight officers and forty men. In France they were known as "The Day Bombing Wing." Major Cunningham will be temporarily attached to the headquarters division of Marine aviation at Washington.

Pacific Fliers Approach Washington

The hazards of cross-country flying when the route is not known, was illustrated in the flight of the squadron of four Army planes coming North from Savannah on December 30th, when on account of engine trouble, one of the four which had come across the continent from the Pacific, had to make a forced landing. The other planes in order not to separate, followed it down. All landed safely in rough country but after making repairs, it was found that the field in which they had landed was too small to take off from and all the planes had to be dissembled, carted out by road into a larger field and assembled again before the trip might be resumed. This job took longer than was anticipated and the delay cost them a day, but a report received by wire from the squadron commander December 31 stated that he hoped to leave for Washington early that morning.

Tillman, the town near which the planes landed, is on a straight line north towards Columbia, South Carolina, and thirty miles from Savannah from which the day's flight was started. The Pacific aero squadron probably will not reach Washington until January 3. The day's incident shows the value of the air mapping work now being done. If this route over which the squadron was flying had been previously air mapped, the pilots would have been able to "spot" a good landing field from their charts immediately, effected an easy landing, made their repairs and come on without loss of time. Good landing fields and many of them are essential to cross-country flying.

The planes made the two hundred miles along the coast between Daytona and Savannah on Saturday, December 28, reporting landing fields all the way. Recently they have been averaging 200 miles daily in good weather.

Last reports state that bad weather holds the planes at Raleigh, North Carolina. The commanding officer of the squadron said that he had encountered rain all the way north from Florida. If the weather improved today he said he would start for Washington direct and omit the Langley Field stop. He hoped to arrive in Washington on January 3 or 4.

Gen. March Announces Air Service Units With Third Army

"I have heretofore announced the composition of the Third Army, the Army of Occupation along the German frontier, in terms of divisions, and during the past week we cabled General Pershing to send any other auxiliary troops which actually comprised part of that army so that we might let the people of the country know where their relatives were. The following air units, outside of divisions are serving with the Third Army:

Third Army Air Service Headquarters, First Pursuit Group, Pursuit Squadron No. 4, 4th Air Park, Headquarters Bombardment Group. Day bombing squadron 166 Headquarters Army Observation Groups, Aero Squadrons 9 and 91, Photo Sections 2 and 10 branch Intelligence office 462 D and 463 D Constitution Squadrons.

Headquarters 3rd Army Corps Air Service, First Aero Squadron, 6th Photo Section, 3rd Corps Balloon Groups Reconnaissance, First Balloon Company branch intelligence office.

Fourth Corps Air Service Headquarters, 12th Aero Squadron, Photo Section Number 4, Branch Intelligence office, Balloon group headquarters, 4th Corps, 2nd Balloon Company Army Corps, 88th Aero Squadron and 3d Balloon Company.

We have given out during the week the assignment of various units in France by General Pershing to early convoys, so they will not be repeated, but the sum total is 6,821 officers and 168,239 men, who are assigned to early convoys for return home. The number of men in the United States who have been ordered discharged, which I reported last week as amounting to 900,000, has now been increased to 937,000 by the introduction of some new units. This number with the 168,239 selected by General Pershing brings the number of men slated for discharge up to 1,005,239. The sum total of men who have actually been discharged in the United States up to date is 533,334 The number of officers who have been discharged up to Dec. 27 is 35,400.

U. S. Fliers Lost 21 Balloons in Last Allied Offensive

During the last Allied offensive, between September 26 and November 11, twenty-one American balloons were lost. A report on the balloon companies of the 1st Army in France shows that fifteen balloons were destroyed by German aeroplanes and six by shells, and that the enemy lost at least fifty.

An idea of how hot was the action in which the American units were engaged was indicated by the statement that the 11th Balloon Company was attacked four times on October 6, and that Lieutenants J. A. McDevitt and G. D. Armstrong, attached to that company, were forced to jump twice to escape enemy attacks. Lieutenant W. J. R. Taylor, 6th Company, and Lieutenant B. T. Burt and J. A. Higgs, 7th Company, also made four jumps each. American officers in all, during the offensive, made thirty parachute jumps.

Lieutenant C. M. Reeves, a student observer with the 7th Company, was in the air only four hours and made three parachute jumps, two balloons being burned over his head.

Major-General Summerall, in a communication to the commanding officer of the corps balloon group, commended the companies for their work.

The AIRCRAFT TRADE REVIEW

Sees Express Sent Soon By Air Routes

Within a year fast aerial express and passenger carrying lines, connecting all parts of the United States, will be an accomplished fact, according to a prediction made by Glenn L. Martin of the Glenn L. Martin Company, inventor of one of the many flying machines developed during the war. In the next three years, Mr. Martin believes a system of commercial transport will be developed which will be cheaper than other modes now in use.

"The important future of aircraft," said Mr. Martin, "is the wonderful commercial application in making accessible by aircraft rich outlying districts tributary to important industrial and business centres. Disastrous delays, such as have been encountered on railroads, will be obviated, and the speed of delivery by aeroplane is of course apparent.

"Coast patrol, forest patrol, and mail carrying will be extensively developed. British Columbia has established a system of aerial forest patrol and the United States is arranging a similar system. The success of the mail route between New York and Washington is known to all."

Those who expect commercial aeronautics to develop shortly, according to Mr. Martin, are making their preparations on sound and scientific foundations, looking toward ton-mile economy and reliability. The Government, he said, should take steps immediately to establish landing fields adjacent to manufacturing and industrial centres.

Manufacturers of aeroplanes were already adapting the military aeroplane for commercial uses, the inventor said, but new designs would be forthcoming. He had already adapted his heavy bombing machine, capable of carrying a ton with ease he added.

"The type of machines adapted and developed for commercial uses," Mr. Martin said, "will undoubtedly be multiple motored, which will make the possibilities of forced landings remote and will permit travel in all kinds of weather. Instruments to enable airmen to meet adverse weather conditions need development, and their production is vital to insure the successful use of the aeroplane to commercial uses."

The United States, Mr. Martin said, should take cognizance of the preparations foreign countries were making to adapt the aeroplane to commercial uses.

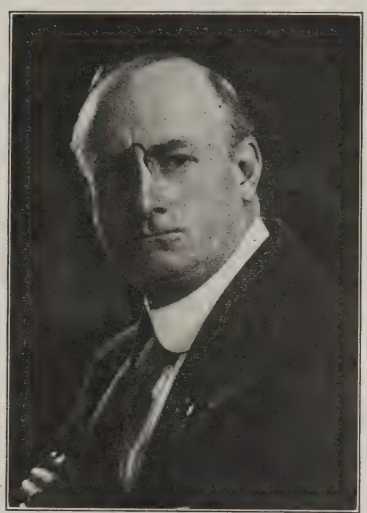
Rost Returns from France

N. G. Rost, the General Sales Manager of the Duesenberg Motors Corporation, has just returned from England and France where he has been for the past three months in the interests of his company.

Trumbull With Wellman-Seaver-Morgan

Horace N. Trumbull, who has recently received his discharge from the Engineer Officers' Training School at Camp A. A. Humphreys, Va., has been appointed Advertising Manager of the Wellman-Seaver-Morgan Company of Cleveland, Ohio.

Before entering the service, Mr. Trumbull was Advertising Manager of the SKF Ball Bearing Company of Hartford, Conn.



Spark Plug with Priming Cup

Those who have experienced the difficulty of starting a cold engine on a winter's day know that it is not a simple or easy task. Many a good spark plug has been condemned through its failure to perform when the temperature hovered around the freezing point.

According to F. B. Caswell, sales manager of the Champion Spark Plug Co., Toledo, Ohio, this loss of time and effort is entirely unnecessary. His contention is that a set of Champion priming plugs installed in an engine will do away with all the uncertainty of cold weather starting.

This type of spark plug is manufactured with a little priming cup right on the plug, itself, so designed as to form a direct connection with the sparking point. When a drop or two of gasoline is placed in the priming cup, it trickles down through the plug right to the sparking point. A slight turn of the little pet cock puts the gas right where the spark jumps and it cannot fail to ignite.

The slight increase in cost of this priming plug over that of ordinary types together with its time and labor-saving advantages has made it a popular cold weather plug, and quite adapted for aviation use.

Dr. Wm. W. Christmas, designer of the "Christmas Bullet" biplane

Crates for Construction Work

During the past six months the salvage branch has endeavored to find a method, advantageous to the Government, of returning empty wing and fuselage crates to the manufacturers. The long freight haul, the flimsy character of the crates themselves and the long time they must be held at a field before a carload accumulates, made their return inadvisable except in a few instances. It is believed that the Government will receive more benefit from their use in construction work at the fields than in any other way and it is recommended that the commanding officers take steps to use them locally, in some way which will not be wasteful and will tend to eliminate the piles of this material which are unsightly and carry a considerable fire menace.

Flying Insignia

The Adjutant General of the Army has approved certain changes in Flying Insignia.

Paragraph 64 (o) Special Regulations No. 41, Uniform Regulations, 1917, is changed as follows:

"Qualified military aviators, junior military aviators, reserve military aviators, military aeronauts, junior military aeronauts, reserve military aeronauts and observers will wear insignia on the left breast above the line prescribed for badges and medals to show their qualifications. Flying instructors of the Air Service will wear insignia on the right sleeve of the coat just above the cuff."

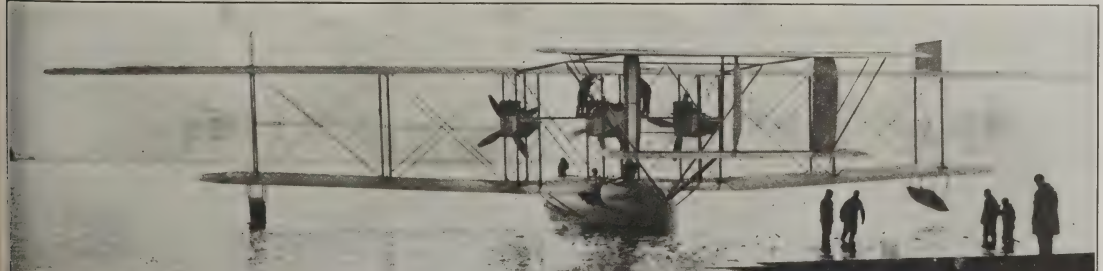
Paragraph 36½, Special Regulations No. 42, Uniform Specifications, 1917, is changed, and paragraph 39½ is added, as follows:

36½ Insignia On Left Breast (Air Service)

Qualified officers will wear insignia on left breast as follows:

(a) Military aviators, junior military aviators and reserve military aviators.—A device of oxidized silver consisting of a pair of wings with the shield between. Device to measure 3 inches from tip to tip.

(b) Military aeronaut, junior military aeronaut and reserve military aeronaut.—A device of oxidized silver consisting of a pair of wings with a balloon between. Device to measure 3⅛ inches from tip to tip.



(c) Observer.—An oxidized silver single wing to the left of the letter "O" in bright silver; the "O" to encircle the letters "US" inoxidized silver in relief on an oxidized silver background. The device to measure 1⅞ inches in length.

39½ Insignia On Sleeve (Air Service)

Flying instructors.—Gilt insignia of the same design and size as the insignia for officers of the Air Service, omitting the propeller. To be worn just above the right cuff on all coats.

Cited for Bravery

First Lieutenant Winfred C. MacBrayne, Field Artillery, observer, Air Service. For extraordinary heroism in action near Fismes, France, August 26, 1918. While he was conducting an aerial reconnaissance and general surveillance from his balloon, Lieutenant MacBrayne was repeatedly attacked by hostile aeroplanes, and continued his mission despite the proximity of strong enemy air patrols against which he had no defense. When an enemy Fokker emerged from low-hanging clouds, firing at the balloon with incendiary bullets, Lieutenant MacBrayne remained in the basket until his companion, who was making his first ascension, had safely jumped. He leaped when the balloon was nearer the ground and his parachute opened as he crossed into the woods. Lieutenant MacBrayne insisted upon reascending immediately, thereby displaying conspicuous coolness and determination. Home address, Mrs. Marguerite V. MacBrayne, wife, 400 East Merrimac Street, Lowell, Mass.

Official Statement Concerning New York-Chicago Aero Mail Service

Important progress in preparation for the New York-Chicago aero mail service was announced on January 4 by the Post Office Department. While Otto Praeger, Second Assistant Postmaster General, in charge of aerial projects, was unable to announce the exact date on which the Atlantic Seaboard-Great Lakes route will be in operation, he declared that thorough plans for the utilization of war material as far as possible and the modification of unsatisfactory equipment should be completed within a few weeks and that flights would be made on schedule.

"Very few persons realize what an undertaking this is," said Mr. Praeger. "Never has a trip by air been undertaken whereby a ship leaves for an 800-mile voyage, one each way a day, flying over mountains with very few landing places—an undertaking which, six months ago, would have been regarded absolutely impossible. When you consider that this is being done with a single-motored plane, the task is stupendous. This has never been attempted, either in America or in any other country of the world, and great credit is due to the organization undertaking it.

"Through the absence of the fullest degree of cooperation the New York-Chicago air mail service was deprived of essential support. Our experiments demonstrated that military construction, especially the type available last December, was neither safe nor economical for mail purposes; and the Post Office Department, with a full appreciation of the desirability of utilizing all material left over from the war, is endeavoring to work out a system whereby there can be developed a ship capable of carrying at least 250 pounds of mail and yet afford the pilot the maximum degree of safety.

"A military plane is designed for military purposes, not mail or commerce. Its weight distribution is faulty, when it comes to carrying letters, and the hope in the future is to have in the New York-Chicago service a machine provided with a distinct compartment. This will do away with the makeshift of using the gunner's cockpit. The reason we have had success in the service between New York and Washington is that training planes and not fighting ships have been available.

"When the New York-Chicago service is resumed we expect to have low-compression Liberty engines, rather than the high-compression, military type. This is a point now being worked out. The high-compression motor is designed for altitude work; in carrying the mails we fly at a comparatively low height and so require a motor that functions efficiently at the proper level.

"The Post Office Department feels that it will be possible to use much of the military equipment, though the fuselage and landing gear of available army planes must be strengthened or altered to meet commercial conditions. This work is under way. With regard to motive power, which caused some trouble at the start of the New York-Chicago service, the Post Office Department has on its staff the most competent Liberty motor mechanics and, in addition, has the help of expert mechanics and riggers placed at our disposal by the aeroplane industry.

"Further preparations also are being made along the New York-Chicago route. The Department has established five landing fields and emergency stops for the 800-odd miles. Leaving Belmont Field, N. Y., the air mail pilot will have an emergency haven at Lehighton, Pa., 105 miles distant. One hundred and fifteen miles further he will have a regular stop at Bellefonte, Pa. Across the crest of the mountains, a stage of 87 miles, he will have a safety field at Clarion, Pa. From this point he will have a clear flight of 128 miles into Cleveland. His next stage and landing field will be 157 miles to Bryan, Ohio, and, 166 miles further on, the Chicago terminal. Each of these fields, regular and emergency, will have an extra ship, a hangar, an extra flyer and a mechanic and watchman, in addition to fuel and other facilities. The staff of pilots engaged for the New York-Chicago route numbers twelve, all of whom have flown more than 1,000 hours. Five of these have seen battle service and a number are aces."

Italy to Have Aero Mail Service With Colonies

Rome.—The colonial minister announced on January 2 that aero mail routes will be developed between Italy and Eritrea and other colonies. Special pilots and machines have already been received for this service.

Two new giant Caproni triplanes, each carrying twenty-two passengers, flew from Ferral to Herva, a distance of 400 kilometers, in three hours.

The Standard type plane used in the Aero Mail Service

CITED FOR DISTINGUISHED SERVICE

THE commander in chief, in the name of the President, has awarded the Distinguished Service Cross to the following named officers and soldiers for the acts of extraordinary heroism described after their names:

First Lieutenant William W. Palmer, pilot, Air Service, 94th Aero Squadron. For extraordinary heroism in action in the region of Doulcon, France, October 3, 1918. Lieutenant Palmer encountered three enemy planes (Fokker type). Despite their numerical superiority he attacked and, in a decisive combat, sent one down in flames and forced the others to retire. Home address, H. W. Palmer, father, Bennettsville, S. C.

First Lieutenant Edward P. Curtis, pilot, Air Service, 95th Aero Squadron. For extraordinary heroism in action in the region of Stenay, France, September 27, 1918. Lieutenant Curtis volunteered to perform a reconnaissance patrol of particular danger and importance 30 kilometers within the enemy's territory. He made the entire journey through a heavy anti-aircraft and machine-gun fire, and flew at an extremely low altitude to secure the desired information. Home address, Mrs. G. T. Curtis, mother, North Goodman Street, Rochester, N. Y.

Captain James A. Wallis, observer, Air Service, 1st Army Observation Group. For extraordinary heroism in action in the region of Metz, France, September 13, 1918. While on a reconnaissance under the most adverse weather conditions, which necessitated flying at extremely low altitude, Captain Wallis, with his pilot, penetrated the enemy's territory to a depth of 25 kilometers. Attacked by five enemy planes, they destroyed one and forced the others to retire. Under heavy fire from the ground, they continued on their mission until it was completed. Home address, Mrs. James A. Wallis, Sr., 11 Bigelow Street, Cambridge, Mass.

First Lieutenant Arthur F. Seaver, pilot, Air Service, 94th Aero Squadron. For extraordinary heroism in action in the region of Etain, France, September 16, 1918. Lieutenant Seaver, with his squadron, started on a bombing raid. The formation was broken up because of various troubles to the machines. Lieutenant Seaver, with his observer, Lieutenant Stokes, continued on and joined a formation of another bombing squadron. After crossing the lines their plane was struck by an anti-aircraft explosive shell, throwing the machine out of control. When Lieutenant Seaver gained control of the machine it had fallen away from the protection of the other planes. With their crippled plane and missing motor they continued until they had reached their objective, when their motor died completely. An enemy plane attacked, but Lieutenant Stokes kept him off until his machine coasted to their own lines. Home address, Charles A. Seaver, father, 12 Rue D'Aguesseau, Paris, France.

First Lieutenant Willis A. Diekema, pilot, Air Service, 91st Aero Squadron. For extraordinary heroism in action in the region of Metz, France, September 15, 1918. While on a photographic mission Lieutenant Diekema's formation was attacked by a superior number of enemy aircraft. In the course of the combat Lieutenant Diekema's companion planes were driven off. Disregarding the fact that his machine was without protection, he continued on his mission until his observer, Lieutenant Hammond, had completed the photographs. On the return they fought their way through an enemy patrol and destroyed one of the machines. Home address, G. J. Diekema, 134 West Twelfth Street, Holland, Mich.

First Lieutenant Leonard C. Hammond, observer, Air Service, 91st Aero Squadron. For extraordinary heroism in action in the region of Metz, France, September 15, 1918. While on a photographic mission Lieutenant Hammond's formation was attacked by a superior number of enemy pursuit planes. Notwithstanding that the enemy planes succeeded in driving off the protecting planes, Lieutenant Hammond and his pilot, Lieutenant Diekema, continued on alone. Continually harassed by enemy aircraft, they completed their photographs, and on the return fought their way through an enemy patrol and destroyed one of the machines. Home address, A. B. Hammond, 2252 Broadway, San Francisco, Cal.

Major John W. Reynolds, Air Service, commanding officer, 1st Army Observation Group. For extraordinary heroism in action in the region of Verdun, France, October 10, 1918. Major Reynolds proceeded over the enemy lines without benefit of protection planes on a mission of great urgency. He flew about 12 kilometers over the lines when he was suddenly set upon by 14 hostile planes. He fought them off and succeeded in downing one of the enemy. He continued his flight with his badly damaged plane and concluded his mission. A bronze oak leaf for extraordinary heroism in action in the region on Grand Pre, France, October 29, 1918. While on a mission Major Reynolds was suddenly set upon by six enemy aircraft. Although in the German territory, without protection and in danger of being cut off in the rear, he entered into combat with the hostile aircraft. He succeeded in shooting down two of the enemy and dispersing the rest of the formation. With his machine severely damaged, he continued until he had completed his mission. Home address, Mrs. John N. Reynolds, Dora Apartments, Twentieth Street and Florida Avenue, Washington, D. C.

First Lieutenant Alexander W. Schenck, pilot, Air Service, 49th Aero Squadron. For extraordinary heroism in action in the region of Doulcon, France, October 4, 1918. Lieutenant Schenck was one of an offensive patrol of six planes that attacked and engaged in combat 17 enemy machines (Fokker type). While he was engaging one of the enemy, he observed a comrade about to be sent down by an enemy plane that had maneuvered to an advantageous position. Lieutenant Schenck immediately left off the combat he was engaged in and shot down the plane, thereby saving the life of his comrade. Home address, Mrs. R. R. Parkhurst, mother, 500 Grant Avenue, Plainfield, N. J.

First Lieutenant Stirling Campbell Alexander, pilot, Air Service, 99th Aero Squadron. For extraordinary heroism in action in the region of Landres-et-St. Georges, France, October 6, 1918. Lieutenant Alexander, with Lieutenant Atwater, observer on a photographic mission, was forced back by seven enemy pursuit planes. A few minutes later he returned over the lines, and while deep in enemy territory was cut off by 12 enemy planes (Pfals Scouts). He maneuvered his plane to give battle, and so effectively managed the machine that he with his observer were able to destroy one, and forced the others to withdraw. With his observer severely wounded, he managed to bring his plane safely back to his own aerodrome, with his mission completed. Home address, Mrs. Lucine Hughe Alexander, mother, Chestnut Hill, Philadelphia, Pa.

Second Lieutenant Frank K. Hayes, pilot, Air Service, 13th Aero Squadron. For extraordinary heroism in action in the region of Chambley, France, September 13, 1918. Lieutenant Hayes was one of an offensive patrol of five planes, attacked by seven enemy scouts (Fokker type), that dived down on them from the clouds, catching the American patrol in a disadvantageous position. In the course of the combat which followed, both of Lieutenant Hayes's machine guns jammed. By an extraordinary effort he cleared his guns and drove off the adversary. He then observed his flight commander in a dangerous situation with two enemy planes behind him. He attacked and destroyed one and forced the other to withdraw. Home address, C. L. Hayes, father, 2000 West One Hundred and First Place, Chicago, Ill.

First Lieutenant Harold R. Buckley, pilot, Air Service, 95th Squadron. For extraordinary heroism in action near Perle, France, Aug. 10, 1918. Lieutenant Buckley was on a patrol protecting a French biplane observation machine, when they were suddenly set upon by six enemy planes. Lieutenant Buckley attacked and destroyed the nearest, and the remainder fled into their own territory. He then carried on with his mission until he had escorted the allied plane safely to its own aerodrome. A bronze oak leaf, for extraordinary heroism in action near Neville, France, and Bourcuilles, France, September 16-27, 1918. Lieutenant Buckley dived through a violent and heavy anti-aircraft and machine-gun fire and set on fire an enemy balloon that was being lowered to its nest. On the next day, while leading a patrol, he met and sent down in flames an enemy plane while it was engaged in reglage work. Home address, Daniel H. Buckley, father, Federal Street, Agawan, Mass.

Second Lieutenant Valentine Burger, observer, Air Service. For extraordinary heroism in action near Hill 360, over the region of the Meuse, France, October 27, 1918. Lieutenant Berger, with his pilot, flying at an altitude of less than 15 meters within close range of numerous machine guns and light artillery pieces fired continually on them, staked the American advanced lines and helped silence enemy machine-gun nests, which were holding up the advance of the infantry at this point. Although the plane was riddled with over 300 bullet holes, and the pilot severely wounded, Lieutenant Burger gathered valuable and accurate information and assisted his pilot to a safe landing within reach of the post of command and delivered his valuable information. Home address, Miss Katie Krauss, aunt, 135 Christie Street, Leonia, N. J.

Second Lieutenant Frank Luke, Jr., deceased, 27th Aero Squadron, Air Service. For extraordinary heroism in action near St. Mihiel, France, September 12 to 15, 1918. Lieutenant Luke, by skill, determination, and bravery, and in the face of heavy enemy fire, successfully destroyed eight enemy observation balloons in four days. Next of kin, Frank Luke, father, 2200 West Monroe Street, Phoenix, Ariz.

Second Lieutenant Otto E. Benell, S. C., 135th Aero Squadron. For extraordinary heroism in action near Thiaucourt, France, September 12, 1918. Lieutenant Benell went out on a two-hour counter attack artillery adjustment under adverse weather conditions. Soon after he suffered an accident to his right hand, which made it useless. In spite of this injury, he continued to operate his wireless key with his left hand, directing the fire of the batteries on concentrations behind the enemy lines. Home address, Mrs. Mary Benell, mother, R. F. D. No. 2, P. O. box 111, Fort Collins, Colo.

First Lieutenant Lloyd G. Bowers, Air Service, United States Army. For repeated acts of extraordinary heroism in action near Gironville and Chatelchesery, France, August 14-29 and October 27, 1918. On August 14 this officers' balloon was attacked by four enemy chase machines and, though urged to jump, he remained at his post and secured information of great value. On August 29 he was attacked by enemy planes using incendiary bullets, but would not leave his post, before his balloon caught fire; he insisted at once upon reascending, although

The Curtiss NC-1, the largest naval flying boat, taking off

MANUFACTURERS' AIRCRAFT ASSOCIATION BANQUET HUGE SUCCESS

AERO SHOW TO BE HELD IN MADISON SQUARE GARDEN

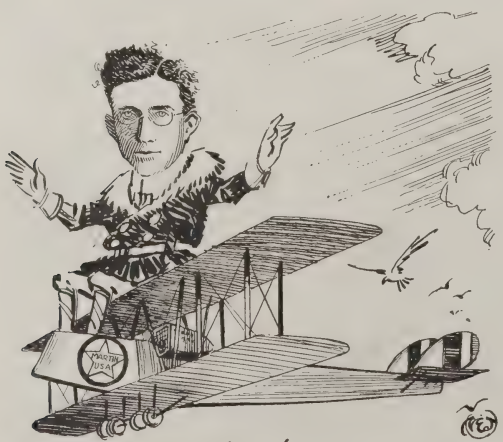
A THOUSAND members and guests of the Manufacturers' Aircraft Association, including more than a hundred pilots in the army aviation service, attended the banquet given by the association at the Waldorf-Astoria January 7. Major General William L. Kenly, chief of the Division of Military Aeronautics of the army, and several other prominent aviators flew from Washington to Mineola to be present at the dinner. Several of the army pilots who just completed the transcontinental flight from San Diego, Cal., to Washington, were present also.

It was announced at the banquet that an aeronautic exposition is going to be held in Madison Square Garden from February 27th to March 6th. The Acro Club of America and the Aerial League of America will co-operate with the Manufacturers' Aircraft Association in making the show a success. The combined membership of the Club and the League is 9,000, most of whom are not connected directly with the aeronautic industry, and who will attend the show out of pure interest.

When the diners were seated the lights were dimmed and Frank H. Russell, toastmaster and president of the association, called for a silent toast in memory of Theodore Roosevelt. The toast was drunk standing while taps were sounded by a bugler in the gallery.

Those at the guest table besides Mr. Russell and Major General Kenly included Charles F. Kettering, president of the Society of Automotive Engineers; Major H. Dourif, of the French Aviation Mission; H. Snowden Marshall; Captain N. E. Irwin, director of naval aircraft production; W. C. Potter, formerly assistant director of naval aircraft production; Henry A. Wise Wood, vice-president of the Aero Club of America; Dr. John R. Freeman, of the National Advisory Committee for Aeronautics; Dr. Grosvenor B. Clarkson, director of the Council of National Defence; Benjamin S. Foss, secretary of the Manufacturers' Aircraft Association; John D. Ryan, former director of the Bureau of Aircraft Production; Brigadier General J. D. Cormack, of the British Flying Mission; the Rev. Nehemiah Boynton, pastor of the Clinton Avenue Congregational Church, Brooklyn; Colonel J. A. Mars, director of aircraft production; Otto Praeger, Second Assistant Postmaster General; Lieutenant Alberto Cantoni, of the Italian Aeronautical Mission; Lieutenant H. H. Emmons, U. S. N., chief of engine production; Colonel William A. Bishop, R. F. C., Canadian ace of aces, and Harry B. Mingle, treasurer of the association.

The dinner formed a part of the campaign of the aircraft manufacturers to solicit the co-operation of the government in a constructive programme for the future development of aviation in this country for government and commercial purposes.



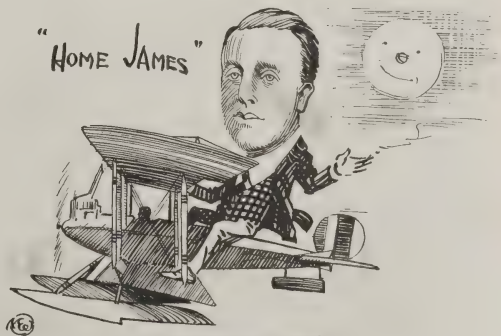
Telegrams of regret were read by Toastmaster Russell from Secretary Baker, Secretary Daniels, General George O. Squire, chief signal officer of the United States Army; Orville Wright, pioneer aviator; Lieutenant Pat O'Brien, an aviator made famous by his activities at the front; Charles D. Walcott, of the Smithsonian Institution; Senator Harry S. New, of Indiana, and others. Secretary Baker said:

"I regret that I cannot have the pleasure of attending the dinner. It will celebrate the conclusion of the great service rendered by the manufacturers of aircraft to the government and to the country. The art was new and the time was short, but the zeal, loyalty and ability enabled the manufacturers to accomplish great results, and the future of aircraft in this country is assured by the success already attained."

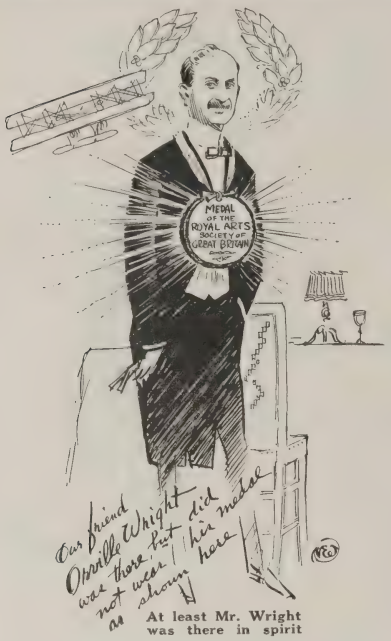
There were three aeroplanes exhibited in a reception room adjoining the grand ballroom. The Curtiss-Kirkham triplane aroused a great deal of interest.

In general form, it is quite different from the prevailing American types and has little in common with the European designs. From the end of its sharp nosed monoque fuselage to the tip of its tail it is entirely of American design and American manufacture.

The body is elliptical in section, and carefully modeled to secure the wonderful streamline form which high speed demands. It is powered with a new Curtiss 400 horsepower



was there with his usual enthusiasm and optimism



At least Mr. Wright was there in spirit

K-12 engine, which is also a recent development and which makes the tremendous speed possible.

Despite its moderate dimensions, the plane is only 32 feet wide, 24 feet long and 10 feet high, it will carry a useful load of over half a ton. The government report credits it with 160 miles an hour, carrying a full military load, armament. pilot and passengers, a feat that is regarded by experts as truly epoch making.

The Thomas-Morse Type S4-E, which was shown, is a further development of the Type S4-E which was used so extensively for training by the War Department during the war. This new machine was designed for the purpose of furnishing the War Department with a faster advanced training machine than the S4-C Type.

It has superior performance in all particulars. The wing area has been reduced from 230 sq. ft. to 145 sq. ft and the weight has been reduced throughout to make a lighter and handier machine. It has a wing spread of about 22 feet, while the overall length is approximately the same as the S4-C Type. A novelty is shown in the fitting of tapered wings, the cord length being less toward the wing tips. This results in a more efficient lifting aerofoil and at the same time offers advantages from a structural standpoint. The total weight of the machine is 1,150 lbs., providing three hours flight duration. Fitted with a 80 H.P. LeRhone engine, this machine has the following performance: Speed, from 55 to 105 miles per hour; Climb, 7,000 feet in ten minutes; Ceiling, 17,000 feet.

The Standard ME1 Scout was also exhibited.

A record flight for speed was made by Major Gen. William L. Kenly in getting to the Banquet. The distance of 250 miles was covered in one hour and thirty-nine minutes, averaging 160 miles an hour. The flight was made in a specially designed De Haviland plane, equipped with a 400 horsepower Liberty motor. The machine arrived at Hazelhurst Field, Mineola, L. I., at 12:30 P. M., having flown from Washington to Philadelphia in fifty-five minutes, and from Philadelphia to New York in forty-four minutes without a stop. The General and his pilot, Colonel W. C. Ocker, had a luncheon of hot coffee and sandwiches on the way.

Col. C. K. Rhinehart, Major W. H. Frank, Captain Roy N. Francis, Lieut. R. F. Behan, and Lieut. Col. Archie Miller came over from Washington in a Glenn Martin Bomber.

The speeches at the Banquet will be recorded in our next issue.

The committee of arrangements comprising J. G. White, chairman, Harry Bowers Mingle, and R. F. Hoyt are to be heartily congratulated on the completeness of their work, and particularly on the appropriateness of the Banquet hall decorations and layout.

The following is a list of guests present: G. H. Abel, A. Adams, F. B. Adams, L. H. Allen, H. W. Alling, F. N. Ames, Dr. J. S. Ames, D. G. Anderson, J. H. Anderson, R. C. Anderson, W. P. Anderson, Colonel H. H. Arnold, U. S. A.; Com. A. K. Atkins, U. S. N.; M. H. Avran, L. H. Austin.

H. D. Baker, Lieutenant L. H. Ball, U. S. A.; R. C. Ball, E. H. Ballard, Colonel T. H. Bane, E. J. Barnard, Major James Barnes, U. S. A.; G. E. Barnhart, W. E. Barrett, Captain R. A. Bartlett, A. W. Bassick, A. G. Batchelder, W. L. Batt, Lieutenant W. Battle, U. S. A.; R. A. Bebb, Professor F. Bedell, L. K. Bell, L. M. Bell, Lieutenant L. Beloni, Lieut. R. F. Benham, W. N. Bennett, Lieutenant H. M. Benstead, U. S. A.; Captain A. A. Berger, U. S. A.; Lieutenant G. Berger, U. S. A.; Ira Berry, K. A. Bickel, P. Bigelow, Jr., Cortlandt F. Bishop, Major Wm. A. Bishop, R. A. F.; J. H. Blackburn, H. N. Bliss, P. W. Bliss, W. P. Blodgett, H. Bonright, B. H. Blood, R. A. Bohn, Lieutenant C. H.Borntrager, U. S. A.; G. de Bothezat, Bouldin, R. V. Borunonville, Rev. N. Boynton, D.D.; S. S. Bradley, Caleb S. Bragg, F. F. Brewster, Colonel W. Briggs, R. A. F.; Lester Brion, C. W. Brook, E. G. Brookman, A. H. Brown, H. L. Broughton, A. L. Brown, Lieutenant-Colonel H. S. Brown, U. S. A.; Lieutenant J. H. Brown, U. S. A.; H. E. Brubaker, H. A. Bubb, Lieutenant J. H. Burke, U. S. N.; H. B. Burndt, C. A. Burrell, Lieutenant George Burton, J. S. Butcher, Captain H. W. Butler, U. S. A.;

W. J. Calhoun, J. A. Callahan, W. J. Cameron, Lieutenant B. F. Camp, M. S. Cannon, Lieutenant A. Cantoni, Lieutenant W. H. Cantwell, W. H. Carpenter, Lieu-

Gallaudet D-4 Light Bomber, making 110 knots (126.7 miles) per hour, piloted by Lieut. E. F. Stone, U. S. N.

THE LE PERE FIGHTER

CAPTAIN G. LE PERE, an aeronautical engineer in the French Air Service, designed the "Lepere Fighter" with a Liberty engine, for production in the United States. It was intended for use as a fighter or reconnaissance plane and carries two fixed guns firing forward, synchronized with the engine, and two Lewis guns attached to a movable Scarff ring surrounding the rear cockpit.

General Dimensions

Span, upper plane	39′–0¼″
Span, lower plane	39′–0¼″
Chord, both planes	5′–6″
Gap between planes	5′–0⅝″
Stagger	2′–0–15/16″
Length over all	25′–4⅝″
Height over all	9′–10⅞″

Weights

	(*pounds*)
Machine empty	2468
Pilot and Gunner	360
Fuel and Oil	475
Armament	352
Total	3655

Performances

Height (*feet*)	Speed (*m.p.h.*)	Time of Climb (*min. & sec.*)
0	136	0′– 0″
6,000	132	5′–35″
10,000	127	10′–35″
15,000	118	19′–15″
20,000	102	41′– 0″

Ceiling, or height beyond which the machine will not climb 100 feet per minute, 20,800 feet.

Main Planes

Planes are flat in span and have no sweepback. Top plane is in three sections; a center section over the body, and two outer panels. Lower plane in two sections attached at lower sides of fuselage in the usual manner.

Upper and lower planes are similar in shape, and with ailerons 21¾″ wide by 94¼″ long attached to both. An interconnecting streamlined rod is used between each pair of ailerons, located behind the outer wing struts.

Leading edge of upper plane is located 49 9/16″ from front of propeller hub. Middle struts located 94⅜″ from center of machine; outer struts, 98½″ from middle struts; overhang, 41″. Interplane strut design is unique inasmuch as it eliminates the usual incidence wires.

Fuselage

Veneer is used for exterior finish. Over all length of fusilage, 22′ ⅛″. Maximum section at the gunner's cockpit, 32½″ wide, 45½″ deep.

Center of gravity occurs at a point 6′ 3″ from nose of fuselage.

Axle of landing gear 22⅜″ forward of center of gravity. The landing gear wheels have a 65 9/16″ track and are 28″ in diameter.

Tail Group

Over all span of stabilizer, 98¾″; chord, 35½″. It is fixed at a non-lifting angle, and attached to upper fuselage longerons.

Tail flaps or elevators measure 158½″ from tip to tip. Their chord is 31⅜″, and in addition to this there are small balancing portions extending beyond the tail plane.

Rudder is 30″ wide and has a balancing portion above the fin, 25″ wide.

Engine Group

A Liberty "12" 400 h. p. engine is used. A description of the Liberty engine was published in the December 16, 1918, issue of AERIAL AGE. It develops 400 h. p. at 1,750 r. p. m. Bore, 5″; stroke, 7″; weight, without propeller and water, 858 pounds. Two Zenith Duplex carbureters are used.

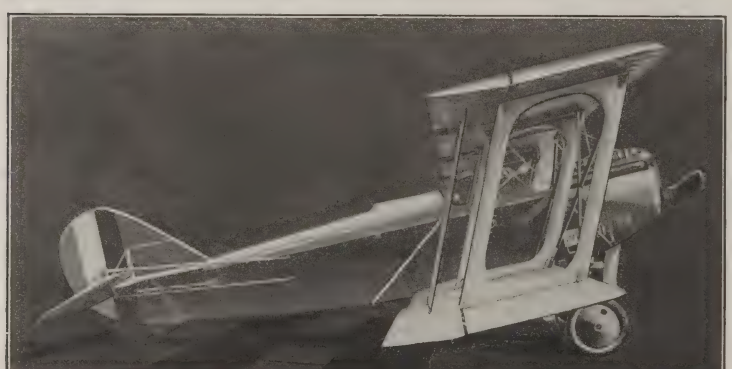
The radiator is located in the upper plane center section, and its location has necessitated some slight modifications in the engine to increase the water circulation.

Propeller, 9′ 4″ in diameter. Front propeller plate projects 11¾″ forward of fuselage nose.

Propeller axis 15 7/16″ below top of upper longerons. In flying position the propeller hub is 5′ 2⅞″ above the ground line; when at rest on the ground the propeller hub is 6′ 1⅜″ above ground.

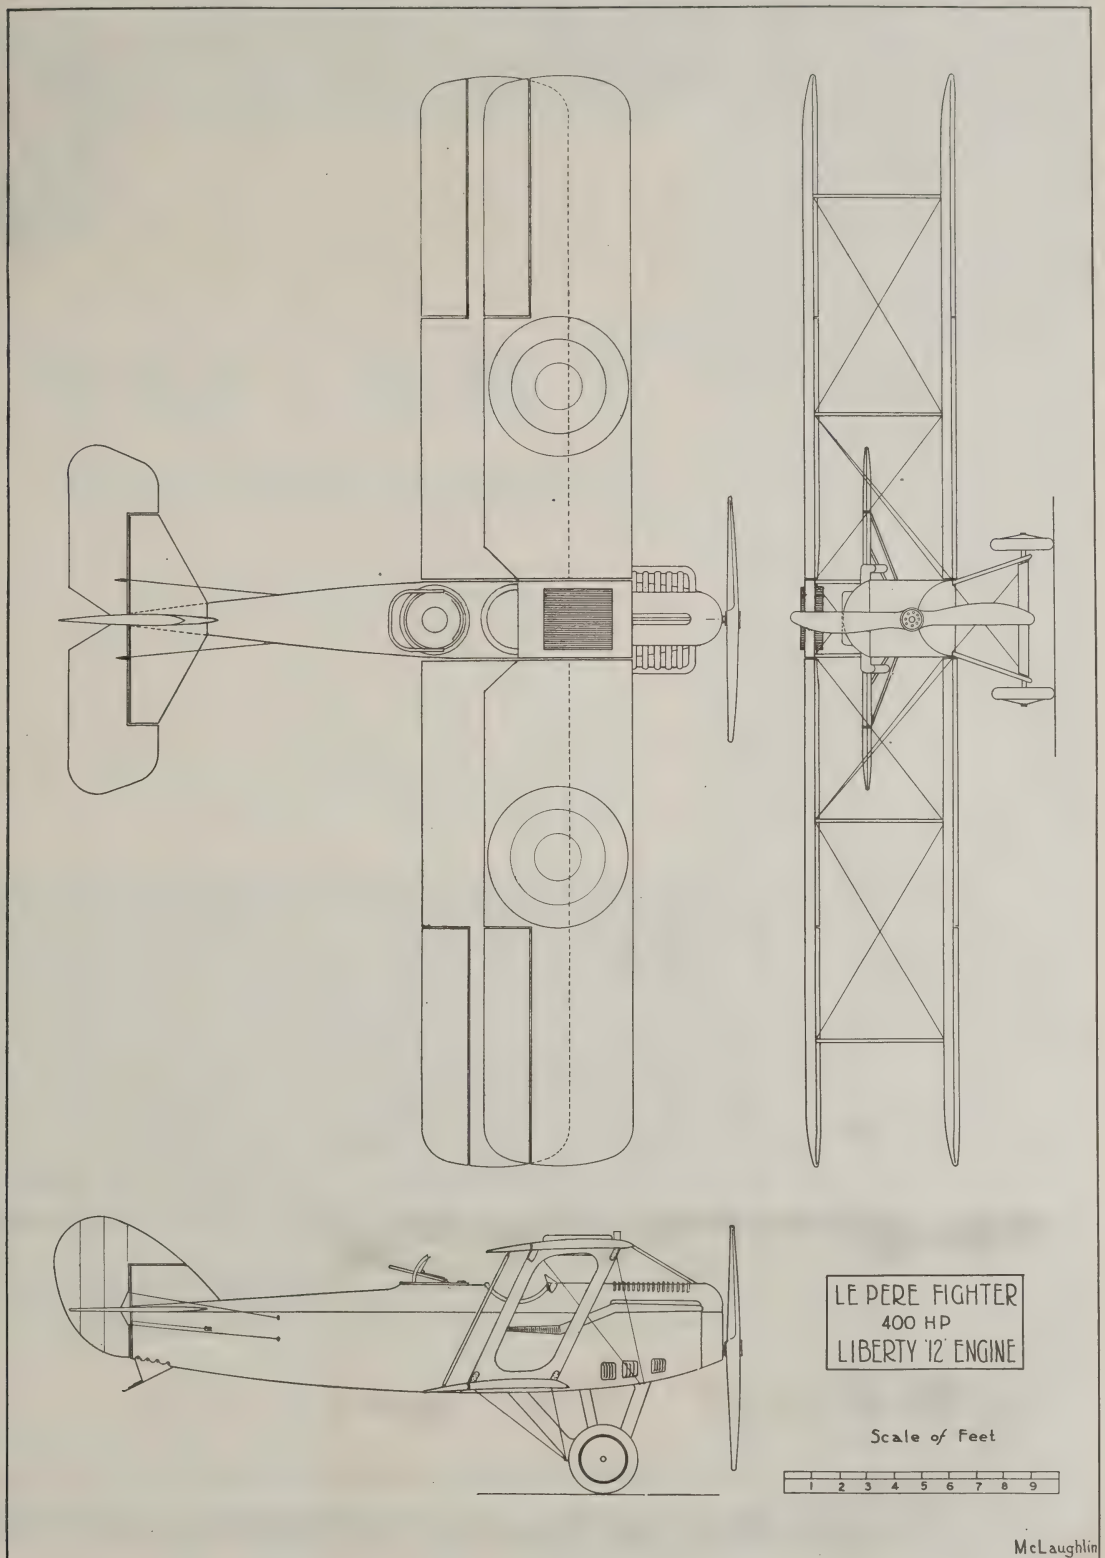
Reconstruction at Gerstner Commended

At the request of the Executive Section the attached communication from the Assistant Secretary of War commending the work of reconstruction at Gerstner Field at a cost of less than a third of the original estimate.



Gerstner Field was practically destroyed by a hurricane on the afternoon of August 6, 1918. Memorandum for Col. C. G. Edgar:

The Assistant Secretary of War has read with much interest your memorandum of December 19, in regard to the reconstruction of Gerstner Flying Field and asks me to say to you how extremely gratifying it is to him to know that the work will be completed for a cost not to exceed $130,000, although the original estimate amounted to $466,000. The use of troop labor has been fully justified and the results far beyond anyone's expectations.—C. H. Hare, for the Assistant Secretary of War.



In a report on the work, Colonel Edgar, Chief of the Supply Section, D. M. A., says in part: "Particular commendation is deserved by the commanding officer, supply officers, officer in charge of construction, and the officers and enlisted men of the service and construction squadrons at Gerstner Field for their exceptionally good work in the rapid reconstruction of the wrecked post."

Teneyck Cited

Second Lieutenant Walton B. Teneyck, Jr., Air Service, pilot, 96th Aero Squadron. For extraordinary heroism in action near Birquenay, France, October 27, 1918. While engaged on a voluntary bombing mission, Lieutenant Teneyck was attacked by seven enemy planes (Fokker type). Although seriously wounded, he maneuvered his plane so skilfully that his observer was able to drive off the enemy planes. In the combat his plane was struck by 25 enemy bullets, some of which exploded the magazines of the observer's guns. In spite of his wounds and the damage to his machine he succeeded in landing safely on a strange field. Home address, Walton B. Teneyck, father, 91 Rodney Street, Brooklyn, N. Y.

"THE OPE

Curtiss Achievements"

1—The design and construction of the fastest fighting airplane ever flown. Official Government records credit this triplane, which was built for the U. S. Navy, known as model 18-T, with 160 miles per hour, carrying full military load, pilot and passenger. This is 15 miles per hour faster than any speed ever claimed for an airplane, a truly epoch-making achievement, made possible by the development of our new model K motor.

2—The design and construction for the Navy of the largest flying boats in the world, colossal crafts capable of carrying five tons useful load. It was one of these boats that recently carried fifty passengers.

3—The design and construction for the U. S. Navy of the fastest and most efficient Seaplane in service anywhere. This craft which is known as the Curtiss model H-A, with Liberty motor, made an official speed of 126 miles per hour with full military load, armament, ammunition, pilot and passenger.

THE HUGHES AIRCRAFT REPORT

(*Continued from last issue*)

African Mahogany

Attention should be called to the fact that the contracts with the mahogany manufacturers called for considerable quantities of African mahogany. It appears that prior to the War large importations of mahogany had been made from Africa. Thus, in 1914, out of total importations of mahogany logs of 70,914,000 feet there were 31,177,000 feet of African mahogany. At the first conference with the Government representatives on January 21, 1918, as the minutes kept by these representatives show, Mr. Mengel had suggested the increased supply which could be obtained from Africa, and Mr. Leary (of Ichabod T. Williams & Sons) "described his efforts to induce the Signal Corps to use African mahogany." Offers of African mahogany were made in proposals by several of the mahogany manufacturers under date of March 6th. Thus, in the proposal then sent to the Signal Corps by C. C. Mengel and Brother Company, it was stated that his company had at Axim, Africa (on the Gold Coast), "awaiting steamers 3,000,000 feet of sound, fresh logs"; and also at Axim "now in streams tributary to it, and available for the June rains, 4,000,000 feet, and these logs, located as they are, and from the best information we have, pretty nearly sure to be delivered at Axim on the June rains, as they were put in pretty good, safe streams by our own men in our own employ and paid by us, and put in streams selected so that they would come out on light water."

The advisability of using African mahogany as propeller material, however, was far from clear. It was not regarded as within the original specifications, but the modified specifications adopted on February 14, 1918 (No. 15,028-A) stated that African mahogany (*Khaya senegalensis mahogani*) was approved by the Signal Corps. Despite this statement, the question was not regarded as settled. On February 13, 1918, H. S. Betts, Acting Assistant Forester, in reply to a letter of Captain Oakleaf of the Signal Corps, stated that it was "undoubtedly true that the term 'African mahogany,' without further specifying as to kind of wood, would include several species which are inferior in quality for propellers," but after referring to various tests quoted a report from the Forest Products Laboratory that the African mahogany was "practically the equal of the Central American species and could be substituted satisfactorily for the latter."

On February 26th, H. K. S. Williams wrote to Major Gray of the Production Engineering Department, that he was "anxiously awaiting information as to whether African mahogany has been approved for use for the manufacture of propellers for battle and bombing aeroplanes." He said that he had reported the matter a number of times to his superiors and had been told to communicate with Major Gray, and after referring to communications he had received on the subject, he asked for a reply by telegraph. On March 1st the Production Engineering Department telegraphed its answer to H. K. S. Williams as follows:

"This Department is not favorably disposed towards African mahogany for combat propellers and does not see why it should be shipped here and then back to Europe. Can not arrangements be made to have walnut for English diverted to our propeller manufacturers and to ship African mahogany to England? There is much poor African mahogany on American market. In any event for safe use African mahogany would have to be inspected at the source to make sure that we obtained the proper varieties and proper wood. We feel further that with provision for splicing which has been adopted there should be enough of other woods available to meet the propeller requirements."

Before this was received, a telegram was sent on the same day to Major Gray, with the signature of the Materials Department, to the effect that they were "anxiously awaiting telegraphic reply to letter February 26th." And on March 2d, the Production Engineering Department, notwithstanding the statements in its telegram of March 1st, telegraphed to the Materials Department as follows:

"Regarding use of African mahogany for combat and bombing aeroplane propellers advise that such wood is acceptable for use in these propellers."

And on March 16th, the Airplane Engineering Department (by Mr. Caldwell, on behalf of Major Marmon) wrote to Major Gray, of the Production Engineering Department, referring to tests of propellers made of African mahogany at Langley Field and McCook Field, and stated the following order of preference for propeller woods: (1) walnut; (2) Honduras mahogany; (3) cherry; (4) African mahogany; (5) quarter-sawed poplar; (6) quarter-sawed white oak. Mr. Caldwell stated further that the following species of African mahogany were acceptable: (1) Grand Bassan; (2) Lagos; (3) Benin; also that there was an African wood similar to mahogany known as "Iroko" which had been found acceptable in the English propeller construction. On March 21st Mr. Caldwell wrote to Lt.-Col. Horner of the Equipment Division, stating that they had definitely ascertained that the wood they had tested came from Axim, and that "this wood would be acceptable at least to the extent of three or four million feet." Mr. Wickliffe, on behalf of Mr. Lockhart of the Materials Department, sent the following memorandum to the Contract Section on the same day (March 21st):

"It is only recently that the use of African mahogany has been authorized in the construction of propellers, and therefore the entrance of purchase request to cover the quantities of African mahogany shown in the attached proposals" (of the mahogany manufacturers) "has been withheld pending such authorization. Permission has now been received for the use of this wood and purchase requests are being sent to the Priority Section today covering the quantity of African mahogany shown in the proposals of Astoria Veneer Mills and Dock Company, Palmer & Parker Company, Ichabod T. Williams & Sons, and C. C. Mengel & Bro. Company."

In view of the heavy demand for shipping facilities, a serious question arose with the Shipping Board as to the necessity of getting in the African mahogany. In a conference between Mr. Karl deLaittre, representing the Shipping Board, and Mr. Sibley and Mr. Wickliffe of the Signal Corps, on May 4th, Mr. Wickliffe's attention was called to the lack of shipping space, and he replied (according to the stenographer's minutes produced by Mr. deLaittre):

"Yes, but this is a matter of contract. We make our contracts in good faith on both sides. It is not permissible for the Government to break these contracts; it would break the people making them. . . . We can not let these people down on the African product."

At another point in the conference, Mr. Wickliffe said:

"If the timber from Africa is not brought forward, coming in June, and is allowed to deteriorate, the first part that will be hit will be the outside of the log, out of which the aircraft material comes. If we do not get this African lumber, we have exhausted every resource in walnut and cherry and in Central American mahogany. We do not yet know as to the use of quarter-sawed oak. Then if we do not get this timber we can not get any African logs before June of the following year."

Meanwhile the subject had been taken up for investigation by representatives of the War Trade Board and of the Forestry Service. Its importance lay in the fact that there was an abundance of white oak available in this country, and it developed that there was opinion of considerable weight in favor of the use of oak on combat propellers.

On June 2d a conference was held between representatives of the Production Engineering Department, the Airplane Engineering Department, the Propeller Inspection Department, the Propeller Purchase Section and the Wood Inspection Section of the Signal Corps. Mr. Caldwell, who had written the letter of March 21st, represented the Airplane Engineering Department. Lieutenant Ryerson's memorandum of this conference contains the following:

"The question of the advisability of, and necessity for importing, African mahogany was carefully considered and it was the unanimous opinion that it would be possible to meet our present and future propeller lumber requirements from domestic or South American supplies and that because of the difficulty of inspecting African mahogany, its further use in propellers should be discouraged."

On August 3, 1918, Lieutenant Ryerson of the Propeller Section, having been asked for a statement of the requirements of woods for propeller stock, requested the Production Engineering Department for "an-up-date formal statement" as to the kinds of lumber to be specified for combat propellers, in the order of preference. This brought a reply under date of August 7th from the Production Engineering Department, through Professor J. S. MacGregor (Head of the Physical Testing Department, School of Mines, Columbia University) as follows:

"Answering your memorandum of August 3d requesting information on kinds of wood for propellers we advise you herewith that this Department has authorized the use of the following woods for combat propellers. The list is given in the order of their preference:

"Black walnut.
"True mahogany (Honduras).
"Cherry.
"Quarter-sawed white oak.
"African mahogany."

The objection to African mahogany (aside from the shipping problem) was that it varied considerably in quality, and that inspection of it so far from its source would make it difficult to be sure that the right species was received. Throughout the controversy Mr. Wickliffe has expressed his views with considerable emphasis and has thrown the weight of his influence in favor of contracts for African mahogany and of the provision of shipping facilities to bring it in. In support of his position, he has produced a memorandum, under date of August 23d, signed by Charles Day, as special assistant to the Secretary of War, to the effect that "while oak propellers are being used with satisfactory results in connection with our training planes, they have not been adopted for planes for active service overseas on account of unsatisfactory results obtained abroad when their use has been attempted for any considerable period." Mr. Wickliffe has also presented a letter under date of July 19th from Lieutenant Hollande, in charge of wood purchasing for the French Government, in which it is said that "we are buying a very great quantity of African mahogany in France direct from our colonies"; also a letter received from the office of the British War Mission giving information to the effect that "the home authorities propose during 1919 to use British Honduras and West African mahogany exclusively for propeller construction, cutting out walnut completely," and that demands from factories in England for propeller lumber are met "indiscriminately by the supply of either British Honduras or West African mahogany, the latter being considered as equivalent to the former for all purposes."

On the other hand, a very recent cablegram (September 28) from the Scientific Attaché to the American Embassy in London in answer to an inquiry of the Research Information Service here, states that "authorities British opinion and practice placing walnut and Kanduranian, Nicaraguan, Cuban mahogany ahead of African. British would not use African if sufficient quantities of above were available. African used only in combination with other woods." The statement to the contrary as to British practice is said to be incorrect, and it is added "British have not tested oak, cherry, poplar sufficiently to make comparison. American army wood experts now here state A. E. F. satisfied with oak and have advised Washington, D. C., accordingly. Poplar has also showed up well on tests. British unable to see any justification for U. S. using African mahogany in view of other furnishings available."

It is understood that ships for African mahogany were finally provided. Upon the evidence, it is apparent that the matter was the subject of discussion and presented grounds for differences of opinion. The interest, however, of some of the leading mahogany manufacturers in obtaining contracts for the delivery of African mahogany is apparent, and while the efforts to induce its purchase and transportation may have been based upon the belief that the wood was better than that available here and that the supply was needed by the Government, the matter is one which should receive consideration in connection with the survey of the industry which has been suggested for the purpose of determining the fairness of the mahogany contracts and of the action taken under them.

3—Sabotage Act—Grand Jury Proceedings

There have been occurrences in various plants indicating efforts to injure war material, or to make it defective, or to conceal defects, but on investigation it has generally been very difficult to find sufficient basis for criminal prosecution, either for lack of evidence as to the particular individual who had committed the act, or because on close examination it appeared that the condition of the material could be fairly attributed to carelessness, and evidence of criminal intent was wanting.

Hammondsport Plant of the Curtiss Company

In the course of this inquiry information was received that frequent attempts had been made to conceal defects in motors and their different parts which were in course of manufacture at the plant of the Curtiss Aeroplane and Motor Corporation, at Hammondsport, New York. Evidence having been obtained as to specific instances of this practice, there was an investigation in July last before a Grand Jury in the Western District of New York, John W. Ryan, Esq., of Buffalo, being appointed special counsel for the purpose, which resulted in the return of indictments against Lewis Longwell and Hector Bordeau, sub-formen in the assembly room of the Hammondsport plant, under section 3 of the Sabotage Act of April 20, 1918. Demurrers to these indictments have been overruled and the cases are awaiting trial.

North Elmwood Plant

In view of the conditions found at the North Elmwood plant of the Curtiss Aeroplane and Motor Corporation, there was a special investigation through special agents of the Department of Justice for the purpose of discovering violations of the Sabotage Act, with the result that evidence was brought before the Grand Jury in the Western District of New York, John W. Ryan, Esq., acting as special counsel, and indictments were obtained in September against Richard Eastman, foreman of the propeller department, Frank Truell, an assistant foreman, and David Rogovan, a workman, under the Sabotage Act. On October 9th, these defendants pleaded guilty and were fined $500 each.

Liberty Iron Works

Testimony given in this inquiry in relation to alleged irregularities at the Liberty Iron Works at Sacramento, California, led to a special investigation in charge of John W. Preston, Esq., Special Assistant to the Attorney-General, before the Grand Jury at Sacramento in September last. Considerable testimony has been taken, but no indictments have been returned.

4—Cross License Agreement as to Rights Under Aeroplane Patents

In view of claims under alleged patent rights, and with the object of facilitating aircraft production by providing for manufacture on a definite basis, a corporation was formed under the laws of the State of New York known as the Manufacturers Aircraft Association, Inc. This corporation entered into an agreement with its "subscribers", that is, its stockholders, called the cross-license agreement. The Government is not a party to the agreement, but it was recommended by the National Advisory Committee for Aeronautics, was endorsed by the Aircraft Board and received the approval of the Secretary of War and the Secretary of the Navy.

By the cross-license agreement, the subscribers grant to each other licenses under all aeroplane patents now or hereafter owned or controlled by them in the United States, its territories and dependencies (except foreign patents and certain specified patents); the corporation is designated as the agent of the subscribers to execute licenses accordingly; each subscriber agrees that it will not enter into any agreement or arrangement whereby its privileges under United States aeroplane patents or inventions will be diminished or surrendered so as to exclude or restrict the operation of the agreement, and that it will not grant licenses under any such patents for use in aeroplanes with reference to which it is receiving royalties under the agreement, to any other person, firm or corporation on more favorable or lower terms of royalty than those provided in the agreement, or which may become more favorable or lower during the term of the license. Under the agreement in its original form, in providing for the payments to be made by subscribers, it is stipulated that each subscriber shall pay to the corporation $200 for each aeroplane sold and delivered by the subscriber until the Wright-Martin Aircraft Corporation and the Curtiss Aeroplane and Motor Corporation (these corporations claiming to hold basic patents) had each been paid the sum of $2,000,000. A supplemental agreement has since been made modifying the provision for payments by subscribers and providing that the aggregate payments to both the Wright-Martin Corporation and the Curtiss Company should be $2,000,000 instead of $4,000,000.

The agreement has been criticized upon the ground that its provisions constitute a hindrance to the progress of invention in the important aeroplane field and as being in restraint of trade. Whatever ground for criticism exists in this respect is to be found in the terms of the agreement itself, as these are quite definite and determine its operation and effect. I shall not deal with the question of the legality of the agreement, as the question was specifically submitted by the Secretary of War to the Attorney General whether the association and the agreement were in contravention of the anti-trust statutes of the United States and the opinion was expressed by the Attorney General that they were not. That disposed of the question, in the absence of a contrary decision by the courts, so far as the action of the Executive departments is concerned.

To the question whether the patents of the Wright-Martin Company and of the Curtiss Company are basic patents, and whether the payments for which the agreement provides constitute a proper compensation for the rights conferred, it would require an exhaustive examination of the patent situation to give a satisfactory answer, and this inquiry has furnished no opportunity for such examination. For this reason no opinion is expressed upon the point further than to say that, if the validity of the agreement be assumed, the amount of the payments was a matter of sound administrative discretion, and there is no ground for the conclusion that the amount as fixed in the supplemental agreement could not fairly be allowed. It is also asserted that the Government is left liable to other claimants, but this also requires an opinion upon the validity of certain patent claims which could not be dealt with in this inquiry.

(*To be continued*)

HONOR ROLL OF AMERICAN AIRMEN

Washington.—The War Department, December 28, made public a list of 150 American commissioned officers of the Air Service who were killed in action at the front in 1918.

The complete list of the 150 American commissioned officers of the Air Service killed in action in 1918, with the date of their death, the detail to which they were attached at the time, and their emergency addresses follows:

Aldrich, Perry Henry, Oct. 29, First Lieutenant, 135th Aero Squadron, Essex Junction, Vt.

Angel, Cyril M., May 14, Second Lieutenant, 120th Aero Squadron, Attleboro, Mass.

Armstrong, Henry Guion, Oct. 4, First Lieutenant, 13th Aero Squadron, Memphis, Tenn.

Bahl, James La Verne, Oct. 27, First Lieutenant, Italian front, Cleveland, Ohio.

Baker, H. T., Aug. 15, First Lieutenant (C.A.C), 91st; no record.

Barber, Newell C., Aug. 12, Second Lieutenant, French Escadrille, Medford, Ore.

Beauchamp, Oliver T., Aug. 11, First Lieutenant, 27th, Princess Anne, Md.

Bellows, Franklin B., Sept. 13, Second Lieutenant, 50th, Williamette, Ill.

Bittenger, Howard P., Aug. 26, Second Lieutenant, Royal Air Force, 17th Squadron, 1 West 64th St., New York.

Bleckley, Erwin R., Oct. 15, Second Lieutenant, 50th, no address.

Blodgett, Richard Ashley, May 17, First Lieutenant, 95th, 174 Temple St., W. Newton Mass.

Boldt, H. St. John, July 20, 1st Lt., 1st Aero Squadron; no address.

Bowen, Joseph B., Sept. 7, 2d Lt., 32d Royal Air Forces; Pawtucket, R. I.

Bowyer, James E., Sept. 12, 2d Lt., 135th Aero Squadron; Yankton, S. D.

Brodie, Clarence A., Oct. 1, 1st Lt., 13th; 1039 N. Lawrence Ave., Wichita, Kan.

Broomfield, Hugh D. G., Oct. 21, 1st Lt., 93d; Gladstone, Ore.

Brotherton, William E., Oct. 10, 2d Lt., 147th; Chicago.

Bruce, Alexander Bern, Aug. 17, 1st Lt., 94th; Lawrence, Mass.

Burns, James S. D., Aug. 11, 2d Lt., 165th Inf., 88th; 880 West 180th St., New York.

Campbell, Burton L., Aug. 23, 1st Lt., 17th Royal Air Force; Wakeman, Ohio.

Carpenter, J. I., June 11, 1st. Lt., 73d Royal Air Force; Rochelle, Ill.

Case, Lyman E., Aug. 11, 1st Lt., 17th Royal Air Force; 210 S. Cherry St., Lamond, Iowa.

Cassard, Daniel W., July 16, 1st Lt., 147th; Grand Rapids, Mich.

Chapman, Charles Wesley, May 3, 2d Lt., 94th; Jackson, Mich.

Cochran, Robert James, Oct. 10, 1st Lt., 8th; Camilla, Ga.

Cochrane, Stanley L., Oct. 31, 2d Lt., 166th; Christ Field, Mr.

Coleman, De Witt, Jr., Oct. 29, 1st Lt., Italian front, Tenafly, N. J.

Collins, Phelps, March 15, Capt., 103 rd; no address.

Coolidge, Hamilton, Oct. 27, Capt., 94th; Boston, or Harvard Univ.

Craig, Harry Worthington, Aug. 20, 1st Lt., French Escadrille 12; Cleveland, Ohio.

Cronin, Edward M., Sept. 27, 1st Lt., 96th; Bayonne, N. J.

Crumb, Harris E., Sept. 30, 2d Lt., 9th; St. Louis.

Curry, Irby R., Aug. 10, 1st Lt., 95th; Marlin Texas

Carter, Edward Vivian, Oct. 21, 1st Lt., 90th; Spokane, Wash.

Davidson, Gilford Council, Aug. 2, 1st Lt.; no address; no organization given.

Davis, Philip W., June 2, 2d Lt., 94th; Newton, Mass.

Dietz, Philip, July 30, 1st Lt., 99th, R. A. F.; Roselle, N. J.

Dowd, Meredith, Oct. 23, 2d Lt., 177th; 76 Berkeley Ave., Orange, N. J.

Forbes, Earl, Sept. 27, 2d Lt., 20th; Fairmont, Neb.

Emerson, William K. B., Jr., May 14, 2d Lt., (F. A.,) 12th; Rye, N. Y.

Hyman, Karl Henry, June 5, 2d Lt., Inf.; no record in D. M. A.

Fisher, John Jacob, Oct. 14, 1st Lt. ; Punxsutawney, Penn.; no organization given.

Fox, Raymond F., Oct. 7, 1st. Lt., 1st; 491 Ashland Ave., Buffalo, N. Y.

Frebisher, J. E., Capt., Sept. 8, no rank given, 148th, R. A. F.; Arlington, N. J.

Fuller, Roswell Hayes, Sept. 20, 1st Lt., 93rd; Chicago.

Gardiner, E. H., Sept. 14, 2d Lt., 50th; no record.

Garnsey, Edward Grant, Oct. 29, 1st Lt., 94th; Chicago.

Garrett, Claude S., Oct. 10, 1st Lt., 8th; Laurens, S. C.

Giroux, Ernest A., May 22, 1st Lt., 103rd; Boston, Mass.

Goettler, Harold E., Oct. 6, 2d Lt., 50th; Chicago.

Gracis, Ralph D., Aug. 12, 1st Lt., 17th; Bemidre, Minn.

Grider, John McG., June 18, 1st Lt., 85th Chicago.

Gundelach, Andre A. H., Sept. 14, 1st Lt., R. A. F., and 96 A. S.; Chicago.

Hamilton, Lloyd A., Aug. 26, 1st Lt., 17th, R. A. F.; Burlington, Va.

Hammer, Earl M., June 12, 1st Lt., no organization given; San Francisco, Cal.

Hanscom, Austin F., Sept. 20, 2d Lt., C. A. C., 1st; no record.

Harris, David B., Sept. 27, 2d Lt., 20th; Chicago.

Hill, R. C., Sept. 14, 1st Lt., F. A., 99th; no record.

Hirth, F. K., July 16, 2d Lt., C. A. C., 91st; no record.

Hitchcock, R. W., Sept. 4, 1st Lt., 88th, Los Angeles, Cal.

Hobbs, Warren T., June 26, 1st Lt., 103d; Worcester, Mass.

Hunt, Jason Solon, Aug. 1, 1st Lt., 27th; Johnson, Vt.

Jenkinson, Harry, Jr., Sept. 20, no rank given, 148th, R. A. F.; Elizabeth, N. J.

Jerome, Gilbert M., July 12, 1st Lt., no organization given; New Haven, Conn.

Johnson, Arthur Theo., Sept. 13, 1st Lt., 135th; Chestertown, Ind.

Johnson, Conrad, Oct. 23, 1st Lt., no organization given. Duluth, Minn.

Johnson, Harry F. W., May 21, no rank given, no organization given; South Bethlehem, Penn.

Johnson, Donald, Sept. 12, 1st Lt., 104th; Harrisburg, Penn.

Kahle, Clarence C., Oct. 3, 1st Lt., 99th; Pittsburgh, Penn.

Kearney, Thos. E., Aug. 14, 1st Lt., no organization given; Memphis, Tenn.

Kessler, Samuel R., Jr., Oct. 9, 2d Lt., Inf., 24th; no record.

Kelty, Acher E., Sept. 26, 1st Lt., 91st; Rice Lake, Wis.

Kennedy, Chester H., Oct. 23, 2d Lt., F. A., 1st; McMinnville, Tenn.

Ker, David, Sept. 12, 1st Lt., 1st; 430 West 119th St., New York City.

Kimber, Arthur C., Sept. 26, 1st Lt., 22d; no record of address.

Kinney, Clair A., Oct. 4, 1st Lt., 49th; Endicott, Wash.

Kull, Geo. P., Sept. 14, 1st Lt.; Chicago.

Layton, Lawrence, July 28, 1st Lt., F. R., Escadrille No. 77; Georgetown, Del.

Lehr, Manderson, July 15, 1st Lt., F. R., Escadrille No. 117; Albion, Neb.

Loud, Harold D., Oct. 1, 2d Lt., 88th; Oscada, Mich.

Lowry, F. B., Sept. 26, 2d Lt., 91st; Menphis, Tenn.

Loughran, L. B., July 28, 1st Lt., R. A. F.; 103 Park Ave., New York.

NAVAL and MILITARY AERONAUTICS

Key to Abbreviations

AAD—Assigned to active duty.
ABC—Report to Army Balloon School, Arcadia, Cal.
ABC—Report to Army Balloon School, Arcadia, Cal.
ADO—Report to Aviation Supply Depot, Dayton, Ohio.
ADT—Report to Aviation Supply Depot, Dallas, Texas.
AFO—Report to Aviation Supply Depot, Fairfield, O.
AGC—Report to Aviation Supply Depot, Garden City, L. I., N. Y.
AHT—Report to Aerial Gunnery School, Houston, Texas.
AIR—Transferred to the Air Service, National Army, without change in rank or date of commission.
ALF—Report to Camp Alfred Vail, Little Silver, N. J.
AMV—Report to Aviation General Supply Depot, Morrison, Va.
AOV—Report to School for Aerial Observers, Hampton, Va.
APR—Report to School of Aerial Photography, Rochester, N. Y.
ARV—Report to Aviation Supply Depot, Richmond, Va.
ASM—Report to Aviation Mechanics' Training School, St. Paul, Minn.
BFT—Report to Barron Field, Fort Worth, Texas.
BRN—Report to Bakers Field, Rochester, N. Y.
BST—Report to Brooks Field, San Antonio, Tex.
CAF—Report to Carlstrom Field, Arcadia, Fla.
CAP—Commissioned as Captain, Aviation Section, Signal Corps.
CDT—Report to Aviation Concentration Camp, Dallas, Texas.
CFT—Report to Carruthers Field, Fort Worth, Texas.
CGC—Report to Aviation Concentration Camp, Garden City, L. I., N. Y.
CGS—Report to Aviation Concentration Camp, Greenville, S. C.
CIT—Report to Radio School, Carnegie Institute of Technology, Pittsburgh, Pa.
CJS—Report to Camp Jackson, Columbia, S. C.
CJW—Report to Camp John Wise, San Antonio, Texas.
CLR—Commissioned as Colonel, Aviation Section, Signal Reserve Corps.
CMV—Report to Aviation Concentration Camp, Morrison, Va.
CPA—Commissioned as Captain Air Service, National Army.
CPR—Commissioned as Captain, Aviation Section, Signal Reserve Corps.
CRI—Report to Chanute Field, Rantoul, Ill.
CSO—Report to the Chief Signal Officer, Washington, D. C.
CUI—Report to School of Military Aeronautics, Cornell University, Ithaca, N. Y.
CWT—Report to Call Field, Wichita Falls, Texas
DAF—Report to Dorr Field, Arcadia, Fla.
DAP—Report to Director of Aircraft Production, Washington, D. C.
DIK—Report to Camp Dick, Dallas, Tex.
DIS—Honorably discharged from service.
DMA—Report to Director of Military Aeronautics, Washington, D. C.
ELA—Report to Eberts Field, Loanoke, Ark.
EOT—Report to Ellington Field, Olcott, Texas.
FLA—Commissioned as First Lieutenant Air Service, National Army.
FLR—Commissioned as First Lieutenant, Aviation Section, Signal Reserve Corps.
FLT—Commissioned as First Lieutenant, Aviation Section, Signal Corps.
FOB—Report to Fort Omaha Balloon School, Omaha, Neb.
FRF—On duty requiring regular and frequent aerial flights.
FSO—Report to Fort Sill School for Aerial Observers, Fort Sill, Okla.
GIT—Report to School of Military Aeronautics, Georgia Institute of Technology, Augusta, Ga.
GLC—Report to Gerstner Field, Lake Charles, La.
HHN—Report to Hazelhurst Field, Mineola, L. I., N. Y.
JMA—Rated as Junior Military Aviator.
JRC—Report to Jackson Field, Riverside, Cal.
KST—Report to Kelly Field, So. San Antonio, Tex. (When specified in the order, the number of the field is given in parentheses)
LDT—Report to Love Field, Dallas, Tex.
LHV—Report to Langley Field, Hampton, Va.
MAC—Report to March Field, Allesandro, Cal.
MAJ—Commissioned as Major, Aviation Section, Signal Corps.
MAT—Report to Mather Field, Sacramento, Cal.
MDO—Report to McCook Field, Dayton, Ohio.
MIA—Report to U. S. Naval Air Station, Miami, Fla.
MIT—Report to School of Military Aeronautics, Massachusetts Institute of Technology, Boston, Mass.
MJA—Commissioned as Major Air Service, National Army.
MJR—Commissioned as Major, Aviation Section, Signal Reserve Corps.
MSC—Report to Radio School, Maryland State Agricultural College, College Park, Md.
OBS—Attached to the Aeronautical Service as Observers.
OSU—Report to School of Military Aeronautics, Ohio State University, Columbus, Ohio.
PFO—Report to Post Field, Fort Sill, Okla.
PMT—Report to Park Field, Millington, Tenn.
PUP—Report to School of Military Aeronautics, Princeton University, Princeton, N. J.
PWM—Report to Payne Field, West Point, Miss.
REL—Relieved from present duty.
RSD—Report to Rockwell Field, San Diego, Cal.
RTR—Retransferred to organization attached to previous assignment to aviation duty.
RWT—Report to Rich Field, Waco, Tex.
SBI—Report to Scott Field, Belleville, Ill.
SAG—Report to Souther Field, Americus, Ga.
SGS—Report to Camp Sevier, Greenville, S. C.
SLA—Commissioned as Second Lieutenant Air Service, National Army.
SLR—Commissioned as Second Lieutenant, Aviation Section, Signal Reserve Corps.
SLT—Commissioned as Second Lieutenant, Aviation Section, Signal Corps.
SMA—Report to School of Military Aeronautics, Cambridge, Mass.
SMM—Report to Selfridge Field, Mount Clemens, Mich.
SRC—Report to Columbia School for Radio Officers, New York City.
TFT—Report to Taliaferro Field, Fort Worth, Texas. (When specified in the order, the number of the field is given in parentheses)
TMA—Report to Taylor Field, Montgomery, Ala.
UCB—Report to School of Military Aeronautics, University of California, Berkeley, Cal.
UIU—Report to School of Military Aeronautics, University of Illinois, Urbana, Ill.
UTA—Report to School of Military Aeronautics, University of Texas, Austin, Tex.
VBW—Report to Vancouver Barracks, Washington.
WAC—Report to Aviation Concentration Camp, Waco, Tex.
WCS—Wire to the Chief Signal Officer upon arrival.
WDM—Wire, Director of Military Aeronautics, upon arrival.
WFO—Report to Wilbur Wright Field, Fairfield, Ohio.

Notes

Note 1—Report to places mentioned in the order named.

Note 2—Report to Fergus Motors of America, 370 Jelliffe Avenue, Newark, N. J.

Note 3—Report to Speedway, Indianapolis, Indiana, to commanding officer.

Note 4—Report to district traffic representative, Pittsburgh, Pa., and wire DAP.

Note 5—Report to supply depot, Little Rock, Ark.

Note 6—Report to Radio Mechanics, Carnegie Institute, Pittsburgh, Pa.

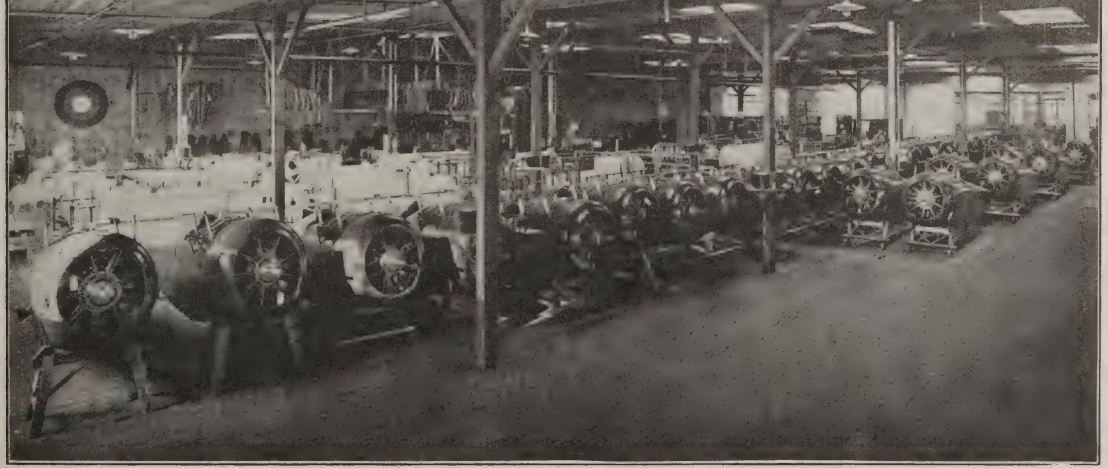
484 Aero Construction Squadron Cited

The following citations from the Army Air Service of the First and Second Armies have been received by the 484th Aero Construction Squadron:

"The Army Air Service Commander, Second Army, American Expeditionary Forces, desires to record in General Orders, his appreciation of the excellent conduct and efficient co-operation always displayed by the officers and men of the 484th Aero Construction Squadron (Captain John Sloan, Commanding).

"This squadron constructed the advanced air-dromes of Noviant-aux-Pross, Saizerais and Maconville, with exceptional speed and thoroughness, thereby contributing in a large measure to the successful operation of the other air service units." (Signed) F. L. Larm, Colonel, A. S., U. S. A.

"The Army Air Service Commander, First Army, desires to make of record in General Orders of the First Army Air Service, his extreme satisfaction with the conduct of the officers and men of the following units:



"1. 484th Aero Construction Squadron. For efficient and meritorious work in building aerodromes for the service. The work of both officers and men was remarkable for its speed and excellence, despite the many hardships confronted." (Signed) W. C. Sherman, Lieut. Colonel, G. S., U. S. A., Chief of Staff.

Cited for Distinguished Service

The commander in chief, in the name of the President, has awarded the distinguished-service cross to the following named officers for acts of extraordinary heroism:

First Lieut. Rodney M. Armstrong, Air Service, pilot, 168th Aero Squadron. As pilot of a D. H. 4 plane, Lieut. Armstrong flew an infantry contact machine over the lines of the 7th Division November 4, 1918. Owing to low clouds and rain, he crossed the line at 1,000 feet in order to enable his observer to locate the position more accurately. While on the enemy's side, he was wounded by an explosive bullet. In spite of his wound and weakness, he continued his mission, coming down to within 500 feet of the enemy's machine guns and troops, until his observer had signaled him that the mission was completed. Home address, 1012 East Eleventh Street, Winfield, Kans.

First Lieut. James F. Manning, Jr., Air Service, pilot, 49th Aero Squadron. In action near Doulcon, France, October 4, 1918, while leading a patrol of seven planes, Lieut. Manning accepted combat with 17 German machines (type Fokker) at an altitude of 1,200 meters. Through his courageous leadership and skillful maneuver of his patrol, seven of the enemy planes were shot down. Home address, Leesburg, Va.

Interior of the "Standard" Factory, showing over thirty fuselages for the ME-1 Scout Training planes equipped with Gnome and le Rhone engines

FOREIGN NEWS

Says 'Plane Surrender Cripples Germany

London.—For the Allies to take 2,000 aeroplanes from Germany in accordance with the terms of the armistice means militarily crippling Germany in the air beyond hope of early recovery, while immensely adding to the aerial strength of the Allies, says an aviation expert. This is emphasized, he says, by the fact that in five months of the heaviest air fighting of the war, Germany lost in aerial combat with the British alone something like 2,700 machines. To this total must be added the destruction of the French and American air services.

The expert asserts that for several months before the armistice, Germany's capacity for producing aeroplanes was unequal to the task of replacing her immense losses. This, he adds, was strikingly illustrated by the almost complete failure of her air arm during the final and most critical phase of the war.

British Polar Expedition

London.—Plans have been quietly laid for a British aeroplane expedition to start for the North Pole in April. The British party will travel via Spitzbergen, where, under the direction of Captain Wild, who was second in command of Sir Ernest Shackleton's South Polar venture, a landing place is in the course of construction at Lawe Sound, and where a camp with abundant supplies has been established.

Captain Frank Wild is a veteran in Antarctic exploration. He was second in command of the Scott expedition in 1901-4 and was a member of the Dr. Douglas Mawson exploring party some years later. He was with Sir Ernest Shackleton first in 1907-9.

Captain Wild commanded the twenty-two men who were left on Elephant Island April 16, 1916, by Shackleton when he made his famous journey of 750 miles in an open boat with six comrades to South Georgia Island for relief. Wild and his men lived until August 20 on one meal a day, consisting mainly of penguin fried in blubber, unaware that Shackleton had been successful and that help was on the way. They endured incredible hardships.

Robinson, Air Hero, Dies

London, Dec. 31.—William Leefe Robinson, one of the best known members of the Royal Flying Corps, died tonight at Harrow, following an attack of influenza.

Robinson, to whom was awarded the Victoria Cross in 1916 for bringing down a Zeppelin which was raiding London, was captured by the Germans last April and returned to England on December 14.

During his imprisonment, Robinson attempted several times to escape, but was recaptured. The Germans placed him in solitary confinments in a small cell, it is said. Since returning he is reported to have suffered severely from the hardships he endured while a captive.

Coblenz Watches U. S. Take Over 200 German Aeroplanes

Nancy, Jan. 2.—The proud Fortress of Coblenz in its long military history never saw a scene such as yesterday, when in a huge aerodrome created by American hustle on the plateau behind Fort Alexander, towering high above the Rhine, a commission of German aviators began the humiliating task of turning over 6,000,000 marks ($1,380,000) worth of aeroplanes, comprising 200 of the newest model Fokkers, to their American victors.

Under the terms of the armistice the Germans are forced to give a fifteen-minute trial flight in one aeroplane out of every twenty. In the presence of a large crowd of American flyers, Red Cross nurses, Y. M. C. A. entertainers and staff officers, Pilot Sergt. Donhauser, who boasts that he brought down Quentin Roosevelt, was forced to make a test flight despite a gale and German protests.

After an exhibition of trick flying, looping the loop included, he was chagrined to learn upon landing that he had flown only thirteen minutes and was compelled to do it all over again.

The ranking American flyer intimated to the German commissioners that this was not a sporting but strictly a business proposition, and that all the formalities under the terms of the armistic mus be lived up to.

Foe Gives Up Sixty More Aeroplanes to American Forces

Coblenz, January 4.—Sixty more German aeroplanes were accepted to-day by the Americans. One hundred more, which will be turned over, have arrived here and are being given trial flights by German aviators preparatory to their acceptance. So far all the machines offered have been accepted. All are new.

Britain Had Fleet of Air Torpedoes

London, December 24.—According to a dispatch to the New York *Sun* the lifting of the censorship now permits the disclosure that England had in operation several months before the armistice was signed a "flying torpedo boat," one of the navy's deadliest weapons, which is credited with having had a lot to do with causing Germany's abject surrender.

The enemy had devised means of successful protection of his naval bases against torpedo boats and submarines, but the latest invention of British air and naval science baffled the Germans. Had not the armistice terms been accepted the destruction of Kiel would have been assured. When the idea was broached of having an aeroplane discharge torpedoes, technical difficulties seemed insuperable. The torpedo weighs one ton.

The effect of discharging the torpedo, thus lightening the machine was disastrous in the initial experiments. Once the wings collapsed and the pilot was hurled to death. On another occasion the discharged torpedo hit the water at an awkward angle and riccocheting from the surface rose and demolished the aeroplane. The difficulties, however, were overcome with such success that one British aeroplane dischaged torpedoes which sank a Turkish transport carrying 3,000 troops.

The efficiency of the weapon may be realized from the following brief details of its operation. Espying an enemy craft, the flying torpedo boat makes a sudden dive from the clouds at a speed of 150 miles an hour till it is within fifty feet of the surface, when it discharges the torpedo direct at the enemy ship, then rapidly rises and disappears in the clouds. The operation is so swift that the enemy is unable to train his guns. The machines can be launched from land or sea or from the deck of a ship.

When the German fleet surrendered, an aeroplane mothership, carrying twenty of the new type machines, met the enemy at sea, in readiness to sink the German ships if any treachery should be attempted.

"Flying Tank" Captured

London.—Many aeroplanes were destroyed in part by the Germans when they evacuated Cologne, according to reports from correspondents in the British area of occupation.

Among the dismantled machines is the skeleton of a huge Gotha, built to carry fourteen men. On its broad wings are walks, while iron ladders lead to the upper plane, where machine gunners were posted.

Another machine (the "Junker") is an armored aeroplane for use in attacking trenches with machine guns. The wings are of corrugated steel, and steel plates, a quarter of an inch thick, protect vital points as well as the seats for two men. Two machine guns point through the bottom of the fuselage.

Truce Halted a Big Air Raid on Berlin

London.—The report of Major-General Trenchard, commander of the independent Royal Air Force, reveals that all preparations for attacking Berlin by air were completed three days before the armistice was signed.

"The seventh group was established in England under the command of Colonel Mullock, for the purpose of bombing Berlin and other centres," the report says. "The group received machines capable of carrying on the work only at the end of October and though all ranks worked day and night in order to get the machines ready for the attack on Berlin, preparations were completed only three days before the signing of the armistice."

The independent force, formed with the object of striking Germany's most vital point and her sources of supply, consisted of sixty machines. Instead of a continuous series of attacks on one industrial centre until it was destroyed General Trenchard decided to attack as many centres as it was possible to reach with the machines at his disposal, because the moral effect would be greater, with no town feeling safe. The moral effect is twenty times greater than the material.

"I considered it probable," says General Trenchard, "that by the spring of 1919 half the force would be attacking enemy aerodromes, while the other half would be attacking long distance targets. Railways were of first importance, with blast furnaces second. The radius of activity of the squadron increased from 272 miles daily in June to 320 in October.

"In September and October a day bombing squadron had to fight practically from the front line to the objective and home. In several cases it had to fight the whole way out and the whole way back. The most accurate calculations of fuel were necessary.

"In one case there was a formation with fuel for five and a half hours. It was out all that time and barely managed to get home. A miscalculation of five minutes would have lost the whole formation."

Canada Takes U. S. Air Station

Halifax, N. S., Dec. 23.—The United States Naval Air Service Station at Eastern Passage, in Halifax Harbor, is to be taken over by the Canadian Naval Service by the first of the year, according to an announcement made here. Sixty of the 250 members of the American units have left the station for New York.

American Aircraft at War's End

Coblenz, Dec. 23.—On the last day of fighting the American Expeditionary Air Force could have put into the air a total of 450 to 460 aeroplanes of all kinds—chase, observation, and bombing. Of this number 102 were American-made machines—De Haviland Fours. There were other American-made machines in France and a large number of Liberty motors, but the figures given represent what was at the front at 11 o'clock on the morning of Nov. 11.

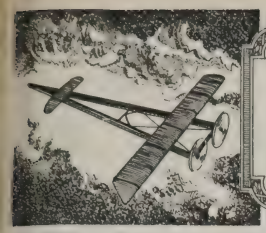
In cases where the American forces had several thousand machines massed for special operations that result was obtained by the assistance of French and English airmen.

Describes Battle Fatal to Quentin Roosevelt

With the American Army of Occupation, Saturday, December 28.—Christian Donhauser, the young German aviator who claims to have shot down Quentin Roosevelt near Chambray, France, on July 14, told of the battle which ended fatally for the son of the former President of the United States. He said:

"I was one of a party of six German aviators, and on July 14 sighted six American machines east of Fere-en-Tardenois. One American, who, I learned later, was Quentin Roosevelt, was ahead of the rest of his squadron and off to one side. He came straight at me, and I swooped down under his machine. We seesawed back and forth, peppering away, and each trying to gain the advantage of climbing above each other.

"Roosevelt made several loops and I admired his gameness. Once I thought his machine gun was jammed, but a second later he began again to shoot and I felt the bullets striking my plane. Then I mounted above him and swooped down to within twenty meters of him, firing all the time. Then I saw my opponent collapse and his machine began to fall."



Donhauser, who is a non-commissioned officer and speaks English, has relatives living in Michigan. He was credited with thirty aerial victories in the fighting after July 1, when he entered the German air service.

The battle with Lieutenant Roosevelt, the German aviator said, was fought at an altitude of between 2,000 and 3,000 meters. In the fight bullets from Lieutenant Roosevelt's machine gun pierced the German aviator's machine in twenty places.

Donhauser said he realized soon after the fight began that his opponent was not as experienced as some Americans he had encountered, but Lieutenant Roosevelt put up a plucky fight to the end. Three or four times during the fight Donhauser declared, Roosevelt had the upper hand for a few seconds.

Captain René Fonck Highest Aerial Score

The highest official score for bringing down Hun fliers during the Great War was made by Captain Rene Fonck, the famous French Ace. Before the Armistice was signed he was officially credited with 75 Boche planes, but virtually he brought down over 100. On two different occasions he brought down six machines within a few minutes. Fonck was a wonderful flier and was among the first to perform the "barrel" maneuver during an aerial battle. The French Government has conferred on him nearly every decoration in its power to give.

ELEMENTARY AERONAUTICS *and* MODEL NOTES

By John F. McMahon

Model Aeroplane Building as a Step to Aeronautical Engineering

I HAVE not given drawings of the motor changes as yet but later on I will present a cut showing the full changes of the motor. This has been held up owing to the fact that companies manufacturing the different parts have failed to give me the information which I need for the drawing. The information I gave in the last article should be sufficient to change the motor for anybody acquainted with the Ford car.

The wings will be considered next. These are made in four pieces; that is, two lower halves, two upper halves, and of course, the center section.

The section of wing we will use is the R.A.F.6 and, of course, working to the nearest 1/64 of an inch. The layout of the wing section is given at the lower lefthand corner and the dimensions are also given. The chord of the wing is 4 feet and the dimensions are given in inches. The builder should lay out the wing section full size according to the dimensions given. The figures along the top show the distance from the chord line that these points are located. The bottom figures show the distance that the bottom curve is drawn.

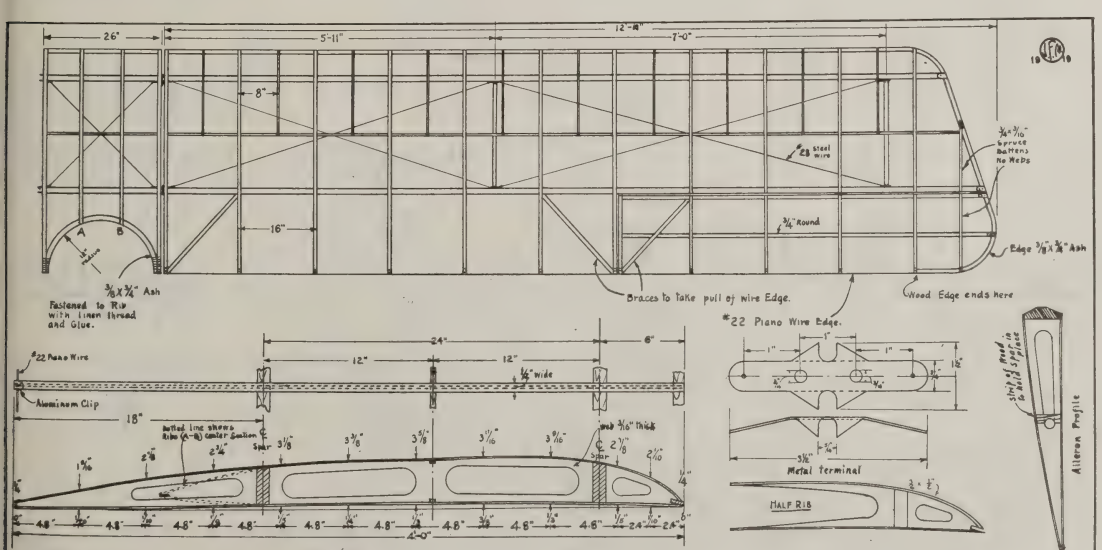
When laid out, a template should be made of 3/16" thick wood of each part of the web. The web is the part of the rib that keeps the two battens which are located top and bottom. The web is made in three pieces, one from the entering edge to the spar, the other between the spars, and the other from the rear spar to the trailing edge. These webs are lightened out as shown and are 3/16".

The battens are fastened with hot glue and small brads about ½ to ⅝" long and about 1/32" thick. The glue is applied first and while the glue is still hot the brads are hammered into place. This forms a rib, and if the webs are made correctly all will be the shape and size. When finished they will have two oblong openings, one six inches and the other thirty inches from the entering edge. (This means from entering edge to the centers of the spar openings.)

By consulting the cut you will see that all the ribs do not run all the way back, but are cut off at the cross batttens. These are termed half ribs and are inserted between each full rib in order to maintain the correct shape of the wing. These half ribs are made of 3/16" thick clear spruce, poplar or fir. (These woods all range about 27 lbs. per cubic foot and have about the same bending strength.) The outline of the rib does not conform to the web for the full ribs as they have no battens and owing to these being omitted the web must be the height of web and battens added together. You will note that the spar hole is the same size and distance as given for the long ribs.

The spars should be made of Fir, as it is a bad job getting spruce these days, and Fir has very few defects. The spars are about 3" deep through the center and 1" thick. The spars taper from the last rib to the ends where the edge is fastened.

When the ribs and spars are finished, the ribs are pushed along the spar. The rib next to the body has a solid rib that is instead of lightening the web it is left solid. A half rib is next pushed along the spar then a full rib, etc., making sure to keep the correct distances. Remember that all wings are the same except two sections are made for the right and two for the left. Wire bracing is inserted to strengthen the wing and the terminals for the wires are placed at a point where the struts are situated. The entering and rake edges are made of ⅜ by ¾" ash. The ribs are then fastened to this edge with thread and glue. The trailing edge simply consists of a steel wire No. 20, a hole being drilled about ⅛" from the end and a strap of aluminium placed over it to strengthen.



Where the ailerons come, the ribs are cut off at the spar, the aileron being made separate. A cross section of the aileron is given in the illustration.

You will see that the spar is beveled to allow free movement of the aileron and a ¾" round spar is placed midway between the trailing edge and the spar.

The center section over the body is made of two solid and two lightened ribs, the light ribs being cut off at the rear along the dotted line in the wing profile. An ash edge bent to the radius of 12" is then fastened to the ends of these ribs; to the solid ribs with linen thread and glue and to the shorter ribs by glue and brads.

The fittting for brace wires is shown in the cut and provision is made for attaching the compression struts in place. The compression struts are ¾" square.

(To be continued.)

Details of main planes and ailerons for the Ford motored aeroplane

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

Standing in Line

I stood in line to join,
I stand in line for mess;
I stand in line for everything
I get, almost, I guess.

And when I soon go back again,
Now that Bill's dream has burst,
I'll stand in line to kiss my girl,
Perhaps, and that is worst.

he knew that the enemy was constantly patrolling the air. On October 27, near Chatelchesery, while regulating artillery fire, he was attacked by several enemy planes and his balloon was perforated by incendiary bullets. He remained in the air and carried out his observation. His extreme courage and devotion to duty furnished a splendid example to the officers and men of his command. Home address, G. M. Bowers, father, 1140 South Thirteenth Street, Birmingham, Ala.

First Lieutenant W. J. R. Taylor, Air Service, United States Army. For repeated acts of extraordinary heroism in action near Malancourt and Montfaucon, France, September 26-October 10, 1918. On September 26, while conducting an important observation, Lieutenant Taylor was twice attacked by enemy planes. He would not jump from his balloon because of the valuable work he was doing for the infantry, although he was at all times in danger of losing his life from incendiary bullets. On October 3, near Montfaucon, Lieutenant Taylor was attacked, but refused to leave until his balloon caught fire. Again, on October 6, he was attacked and forced down in his parachute. On October 10, while he was conducting an important observation, an enemy patrol hovered over his balloon; he refused to jump until attacked at close quarters. His heroic devotion to duty was an inspiration to the officers and men of his company. Home address, W. R. Taylor, father, 13 Prince Street, Rochester, N. Y.

First Lieutenant Paul N. A. Rooney, Air Service, United States Army. For repeated acts of extraordinary heroism, in action near Anstauville and Germonville, France, July 22, and September 26, 1918. On July 22, near Anstauville, Lieutenant Rooney, with Lieutenant Ferrenbach, was conducting an important observation. At an altitude of 800 meters he was several times attacked by enemy planes but refused to leave his post until his balloon was set afire, and only then after he had seen that his companion had safely jumped. While descending, his parachute was almost hit by the falling balloon. He insisted upon returning to his post, and was in the air again as soon as another balloon could be inflated. On September 26, while adjusting artillery fire, his balloon was attacked by three enemy planes (Fokker type). At imminent peril to his life he stuck to his post until one plane dived directly at him. Lieutenant Rooney would not leave the basket until his companion, Lieutenant Montgomery, had jumped to safety. Home address, Mrs. W. J. Rooney, mother, 14 Paris Street, East Boston, Mass.

BARTLETT ARCTIC EXPEDITION TO BE ROOSEVELT MEMORIAL EXPEDITION

THE Executive Committee of the Aero Club of America have decided to make Captain Bartlett's Arctic Expedition the "Roosevelt Memorial Expedition."

It was Roosevelt, while he was President of the United States, who gave Admiral Peary leave of absence to organize and take charge of the expedition which led to the discovery of the North Pole. It will be recalled that Peary's ship was named "The Roosevelt" in appreciation of President Roosevelt's interest in the expedition. Captain Bartlett was Captain of the Roosevelt in two Peary expeditions.

Colonel Roosevelt was a veteran supporter of aeronautics. As early as 1897, when he was Assistant Secretary of the Navy, he used his influence to secure the appropriations needed by Professor Langley to continue his work.

Colonel Roosevelt was also responsible for giving the U. S. Army an aeroplane before any other nation had one. In 1907 he approved the ordering of a Wright biplane and a dirigible.

The Roosevelt Memorial Expedition will have four important missions, as follows:

(1) To explore as much as possible of the 1,000,000 miles of unexplored Polar Arctic regions.

(2) To fly across the top of the world from Cape Columbia on the American side to Cape Chelyuskin on the Siberian side.

(3) To conduct extensive soundings in the Polar Basin and collect flora and fauna from the ocean bottom.

(4) To send up sounding balloons and explore the upper air of the Polar regions, gathering meteorological data.

It is also fitting that the first land, if any land is discovered in this first use of aeroplanes for arctic exploration, shall be named "Roosevelt Land."

The expedition is to start from the United States next June. There are six weeks of fair weather in July and August when, even in the Polar regions, it is seldom lower than sixty degrees above zero. The plans are to have a ship go to Etah, about 600 miles from the North Pole, in June, when the ice is sufficiently broken to permit the ship to cross Melville Bay.

The ship would carry a large seaplane or land aeroplane for the final flight across the top of the earth, and for long distance exploration of the unexplored Polar regions, as well as smaller planes for the scouting flights for short distance survey.

Immediately upon arrival at Etah a base will be established and while waiting for the ice to break up further north to permit the ship, to go as far as Cape Columbia, the small seaplanes will fly to Cape Columbia and establish a base there for the large plane which is to be used for the flight across the top of the world, from Cape Columbia on the American side, over the Pole, to Cape Chelyuskin on the Siberian side and for exploration over longer distances.

For the six weeks after the middle of July, when the weather conditions are best for flying in the Polar regions, the large plane as well as the small planes will be put into service and the important work of the expedition will be done, including sending up sounding balloons in the upper air to gather meteorologic data.

Results of inestimable value to the United States and to science will surely be obtained from this expedition. There is no doubt whatever that this expedition can explore, survey and photograph the unexplored parts of the arctic regions and establish the existence or non-existence of land or lands in that region.

The Committee of the Aero Club of America assisting Captain Bartlett consists of Rear Admiral Robert E. Peary, discoverer of the North Pole; Alan R. Hawley, Henry A. Wise Wood, Henry Woodhouse, Rear Admiral Bradley A. Fiske, John Hays Hammond, Jr., Rear Admiral William E. Little, U.S.N.; Professor Charles L. Poor, Colonel E. Lester Jones, U.S.A.; Charles Jerome Edwards, Major Cushman A. Rice, U.S.A.; Augustus Post, Major J. C. McCoy.

A DIFFICULT PROBLEM WHICH MAY INTERFERE WITH INTERNATIONAL AERIAL TRANSPORTATION

THE report of the British Civil Aerial Transport Committee brings up once more the problem of insuring national safety without interfering with the development of international aerial transportation. The committee's report reads in part as follows:

To the Air Council:

1. By our terms of reference we were invited *inter alia* to consider the development and regulation of civil aerial transport from an international standpoint. We have been informed by the Foreign Office that in the opinion of that Department, if it is desired to set on foot negotiations for the conclusion of an International Aeronautical Convention, no time should be lost in approaching certain Allied and friendly Governments. We therefore think it desirable to submit an interim report on this branch of our subject at once.

2. At the outset of our enquiry we found it necessary to divide the subjects covered by our terms of reference under various heads, and to refer these different heads to special committees for detailed investigation. One of the branches of enquiry so referred comprised international and legal problems, and Special Committee No. 1, who have dealt with these problems, have presented a report which, as far as it concerns international questions, has generally been approved by us. We think it will be found convenient that we should enclose herewith this report in its entirety, and that we should draw attention to certain salient points which seem to us to call for emphasis or comment. We shall deal in a further report with the latter part of the report of Special Committee No. 1, which is concerned with questions of municipal legislation.

3. It will be observed that the Special Committee, in considering the first part of their subject, have taken as a basis the Draft International Convention drafted by the Conference held at Paris in 1910. This Conference was unable to com-

plete a draft convention for ratification by the Contracting Powers, mainly owing to a conflict of opinion between the British and German delegations as to the right of each State to the sovereignty (or to the exercise of control and jurisdiction, whichever term be preferred) in the air space over its territories. In our opinion this question of sovereignty is one upon which agreement between the Contracting Powers is vital in the future interests of civil aerial transport.

4. It is a question on which it is possible to hold different opinions: indeed, some divergence of view with regard to it has manifested itself on our Committee. It must, of course, be admitted that a State must assert some rights of sovereignty in the air space over its territories, since otherwise no legal control could be exercised over aircraft in flight at however low an altitude, but it is possible to take the view either (*a*) that State sovereignty should be asserted *usque ad coelum,* or (*b*) that State sovereignty should be asserted only up to some prescribed level of altitude, above which the flight of aircraft would still be practicable, and that above that altitude the air should be free to all, just as the high seas outside the limits of territorial waters are free to all.

5. From the purely business point of view of the prospects of civil aerial transport in times of peace, the latter view has much to recommend it. The commercial advantages of air traffic are to be expected mainly from rapid uninterrupted flights over long distances, and these advantages would be clearly best secured if aircraft above a certain altitude were allowed to fly freely in any direction without let or hindrance imposed upon them by the municipal legislation of the States over whose territories they might pass.

* * * * * * * *

6. The argument, however, for the doctrine of State sovereignty in the air space *usque ad coelum* is in the main a military one. Military considerations dictated the opposition of the British delegates to the proposals pressed by the German representatives at the Conference in Paris in 1910, and we understand that the views of the Foreign Office and of the naval and military advisers of the Crown are unchanged. To give to foreign aircraft, as a matter of acknowledged international law, the right to fly at will over the territory of the State would be to give them undesirable opportunities for espionage, and generally to limit "the elementary right of a State to take each and every measure which it considers necessary for self-preservation." In time of war, moreover, the doctrine of the "freedom of the air" above a certain altitude would give rise to most embarrassing questions for neutral States. They would actually be exposed to the risk of having aerial battles fought over their territory without being able to claim that their neutrality had been infringed. The case of the upper air presents no true analogy to the case of the high seas outside the limits of territorial waters.

7. The experience of the present war has merely served to increase the force of these considerations, and we agree with the Special Committee that the doctrine of State sovereignty in the air space *usque ad coelum,* on which this country acted before the war, and on which, along with neutral countries, it still acts, is sound, and should be adopted as the basis alike of international agreement and of municipal legislation.

8. As far as the doctrine of sovereignty may be applicable to territorial waters, we agree with the conclusion of the Special Committee that the air space over such waters must be considered from the same point of view as the air space over the land of the State. We desire, however, to point out that the questions of sovereignty over and of any extension of the limits of territorial waters are primarily the concern of the Admiralty, and that military rather than civil considerations must be regarded as of major importance in this connection.

* * * * * * * *

10. We approve the detailed conclusions of the Special Committee set out in Appendix A to their report. The technical regulations contained in Annex C of the Draft International Convention were referred to Special Committee No. 2 of our Committee, and we further approve their detailed recommendations. Recent developments in the science and practice of aeronautics have rendered necessary some amendments of regulations agreed to in 1910, more particularly since such regulations were at that date considered from the aspect of the use of airships rather than of aeroplanes.

11. In paragraph 10 (i) of Part I. of their report the Special Committee have touched upon an important question which was not considered by the Conference held in Paris in 1910. We think that the possibility of damage done by foreign aircraft visiting this country is a matter for careful consideration when it is remembered that, unless an aircraft is itself damaged, the owner of it is in a peculiarly advantageous position as regards escape from the legal consequences of his act. We agree with the Special Committee that, if some system of insurance could be mutually arranged between the Contracting Powers, or at least between H.M.G. and the States whose aircraft are most likely to visit this country and over whose territories our own aircraft are most likely to fly, such an arrangement would be of distinct advantage to civil aerial transport.

12. Having regard to paragraph 10 (ii) of the report of Special Committee No. 1, we hold a strong view that some international agreement which will permit of the utilization of aerial routes immediately after the war is of urgent importance for the purpose of encouraging civil aerial transport, and that therefore early steps should be taken to enter into the necessary negotiations.

* * * * * * * * *

For the Civil Aerial Transport Committee,
(Signed) JOHN BAIRD,
(Acting Chairman).
February 7, 1918.

(Signed) D. O. Malcolm,
(Secretary).

Aircraft are with the world to stay. Larger and faster aircraft are coming. Aerial transportation is to be a strong factor in the reconstruction. Therefore the problem is one that deserves the serious consideration of the world's leading jurists.

Why not solve it by agreeing to freedom of the air above the 20,000-foot level?

THE ATLANTIC AIR ROUTE

THE Chief of the Bureau of Aeronautics, Major Gen. William L. Kenly, traveled with a pilot at the rate of 160 miles an hour in a specially designed Haviland plane from Washington to Mineola. Greater speed was made by Pilot Eric Springer and a mechanician, who, in a Glenn L. Martin bombing plane driven by two Liberty motors, flew from Dayton to Cleveland, 215 miles, in an hour and a quarter, at a rate of about 175 miles an hour. General Kenly was not trying for a record, and he expects to make a faster trip from Washington the next time. The Ohio aviator believes that he has beaten all creation, but tomorrow some one in this country, or in England, or in France may report a swifter flight. Aviation records tumble almost every day. Given a machine with motors powerful enough to keep it in the air for nine hours and a half at a speed of 175 miles an hour, and the Atlantic could be crossed in a continuous flight from the most easterly point in Newfoundland to the most westerly point in Ireland, a distance of 1,640 miles.

At the dinner of the Manufacturers' Aircraft Association

THE NEWS OF THE WEEK

"Welcome Home" Plan of Aero Club Working Well

The difficult problem of welcoming the returning aero squadrons at the different ports throughout the United States has been solved by the Aero Club of America by the employment of wireless.

Upon learning from the War Department of departure of transports from Europe carrying Aero Squadrons the Club sends a wireless reading as follows, which was the wireless sent to the thirteen aviators returning on board of the transport *"Accomac,"* which is due to arrive at New York on January 17th:

"To Captain of Transport 'Accomac.'

"Kindly transmit the following message to the members of aero units on board of the 'Accomac':

"The Aero Club of America and forty affiliated aero clubs greet and welcome you back to the United States. As hearty a reception awaits you at the New York Club House as you had at the Paris Club House."

"The method is working to perfection," said Mr. Alan R. Hawley, the President of the Club, today. "It reaches all the members of the aero units, and as they cannot come immediately upon landing, because they must go to camp, they come later."

The Aero Club also has a permanent reception committee consisting of Messrs. Alan R. Hawley, Rear Admiral Bradley A. Fiske, Major Cushman A. Rice, Henry A. Wise Wood, Hon. Murray Hulbert, Henry Woodhouse, Professor Charles Lane Poor, Augustus Post, Charles Jerome Edwards, K. M. Turner, Lieutenant Godfrey L. Cabot, U. S. N., Captain Robert A. Bartlett, and Leroy B. Gulotta. Every ship is met by some of these members.

Lieut. Rodman Awarded $1000 Curtiss Prize

The Contest Committee of the Aero Club of America at a meeting held on January 8, awarded the $1,000.00 cash prize which accompanies the Curtiss Marine Flying Trophy, to Lieut. Thomas Clifford Rodman, of the U. S. Navy, who flew in this contest as a representative of the Aero Club of America.

Under the rules the cash prize goes to the winning pilot and the Aero Club of America becomes the permanent owner of the trophy, as it has been won for three consecutive years by one of its members.

There were seven entrants in this contest which ended December 31st, 1918, and the flight of Lieut. Rodman in a H-16 flying boat with two Liberty motors at Pensacola, Florida, carrying 11 passengers and covering 669 statute miles in nine hours and 12 minutes with one stop was the longest distance made, and with his allowance of 5 per cent for each passenger carried, and deducting 5 per cent for one stop and 5 per cent for flying over a broken course, the final record allowed amounted to 970.1 miles. This flight was officially observed by Ensign R. A. Tallott, Ensign M. S. Martin and Lieut. (j.g.) E. M. Mitchell of the U. S. Navy.

Another very creditable flight was made by Lieut. Commander P. N. L. Bellinger, U. S. N., in an F-5 flying boat at Norfolk, Virginia, who made a record of 834.9 miles in nine hours and one minute without stop, carrying five passengers and 542½ lbs. of ballast, a total of 1464 lbs.

Major John C. P. Bartholf, J.M.A., the popular commanding officer of March Field, Riverside, Cal.

Capt. T. R. Shearer, M. C. R., in an H.S. flying boat, flew 574.2 between Miami and Palm Beach, and Lieut. Douglas Manning, M. C. R., in an H.S.1 Curtiss flying boat, flew over the same course, making 552.9 miles in 8 hours and 23 minutes with two stops. Other flights were made by Lieut. G. B. Newman, M. C. R., in a JN4H, flying over the same course, 504 miles in 7 hours and 40 minutes with one stop.

On October 25th, Stewart W. Cogswell in an Aeromarine hydroaeroplane, flew 459 miles in 7 hours and 53½ minutes, with two stops for fuel between Keyport, N. J., and Coney Island, L. I., New York.

Dirigible Record Homologated

The Contest Committee of the Aero Club of America has homologated the dirigible flight record made December 24th to 26th, by Ensign T. E. Maythem and Chief Carpenter's Mate J. H. Collier in dirigible "A" 236, who flew 691 linear miles in 40 hours and 48 minutes, and the distance was further augmented by 13 hours of flying at Palm Beach, Miama and Key West, which would amount to at least 200 miles additional. The course was from Key West to Tampa, Tampa to Cape Sable, Cape Sable to Palm Beach and Palm Beach back to Key West. Two hundred pounds of water ballast were taken aboard by means of a line and specially constructed bucket. Messages were dropped over Palm Beach, and exhibitions were given at various places en route. Food and drinking water was included in the complete equipment which was carried, which totaled 832 pounds and included extra oil, gasoline, clothing, sea-anchor, life belts, camera, radio apparatus light and batteries. The motor was stopped only twice for three minutes each time to put in extra oil, and 24 gallons of gasoline remained at the end of the flight. This flight establishes a new record in this country for this type of a dirigible and it is believed to be a world record, for time spent in continuous flight.

A previous flight was made by Ensign T. E. Maythem in the same dirigible on November 23rd to 25th, when he covered 372 miles carrying two passengers and full equipment from the same Naval Air Station at Key West.

The Aeronautic Exposition

Hearty co-operation on the part of the War and Navy departments is assured for the annual aeronautical show which the Manufacturers' Aircraft Association is to hold at Madison Square Garden, from February 27 to March 6th. This assurance from Washington means that the exposition will take on the permanent character of a combined effort, uniting National Defense, scientific achievements, and industrial development.

A statement given out by the Manufacturers' Aircraft Association, indicates that the exposition is to have the benefit of Naval and Military co-operation and, while no definite announcement may yet be made with regard to trophy displays, it is believed certain that this exposition which will take rank as the first of a national character, will afford opportunity for the public to inspect for the first time, not only some of the material taken from the enemy abroad, but much of the remarkable equipment which is owned by both the Naval and War Departments.

Co-operation and co-ordination will be fundamentals of the exposition. In the early days of the war, the industry was called upon to aid wherever aid was needed and this show will illustrate to what a remarkable degree this assistance was carried out. The War and Navy Departments still maintain close relationships with the industry and many of the notable exhibits, therefore, will come through the courtesy and co-operation of the various officials in Washington.

Army Aviators Honor Roosevelt

Army aviators from Hazelhurst Field, Mineola, L. I., paid a last tribute to the late Colonel Roosevelt from the air on January 6. Soon after the death of the Colonel was reported, the commanding officer at Hazelhurst Field ordered ten army pilots to fly to Oyster Bay and keep up an aerial patrol over the home of the ex-President for twenty-four hours. At intervals floral wreaths were dropped upon the grounds at Sagamore Hill as a token of the high esteem with which the Army, and particularly the Air Service, held Colonel Theodore Roosevelt.

© Underwood & Underwood

A new tandem biplane recently tested at Mineola. The results of the tests have not yet been made public

Rickenbacher to Fly for Loan

Washington.—Eddie Rickenbacher, American ace in the Flying Service in Europe, may make a series of flights through the United States this spring under the auspices of the Treasury Department at the time of the next Liberty Loan. The Treasury Department is now negotiating with the War Department on this matter.

Enlistment of Discharged Temporary Officers

Under the provisions of the act of Congress approved March 30, 1918 (Sec. V, Bul. No. 22, W. D., 1918), all commanding officers are authorized to enlist former enlisted men of the Army of the United States who were discharged to accept a commission in any component part of the Army of the United States, and who, having been discharged from such commissions, tender themselves for enlistment within three months after the termination of their commissioned service. Upon acceptance each enlisted man shall be appointed to the grade held by him before he was discharged to accept such commission.

No applicant for reenlistment under this authority will be rejected until his case has been reported to the Adjutant General of the Army with a statement as to the disqualifications or other reasons for rejection and instructions to that effect having been received.

Until the emergency is terminated by proclamation the term of enlistment will be for the "period of the emergency" as at present prescribed by law.

The names and army of service of soldiers reenlisted under this authority will be reported to the Adjutant General of the Army by wire, with a view to instructions for their assignment.

By order of the Secretary of War:

PEYTON C. MARCH,
General, Chief of Staff.

Officers Discharged from Air Service

Among the officers who have recently been discharged from the Air Service in the D. M. A. are the following: 2nd Lieut. Frank H. Carter, Capt. Adelbert Ames, Jr., 1st Lieut. Edwin E. Weise, 2nd Lieut. Norman Dunning, 1st Lieut. James N. Bobbitt, 2nd Lieut. William T. Nelson, 2nd Lieut. Joseph P. Annin, 1st Lieut. Wm. E. Dean, 2nd Lieut. Percival Gilbert, 2nd Lieut. Hermon L. Underhill, 2nd Lieut. Eppa H. Willis, 2nd Lieut. Herbert R. Shepard, 2nd Lieut. Alanson W. Aird, 2nd Lieut. Aubrey Drury, 1st Lieut. Henry L. Taylor, 2nd Lieut. George F. French, 2nd Lieut. Charles King, 1st Lieutenant Paul D. Weathers, 2nd Lieut. John C. Rowland, 2nd Lieutenant William E. Lewis, Major Roger Amory, 1st Lieut. George D. Taylor, Capt. Hamilton H. Salmon, 2nd Lieut. Willis F. Geib, 2nd Lieut. William H. Spurgin, 1st Lieut. William L. Shaffer, 1st Lieut. Jefferson W. Davis, Capt. Hayward H. Kendall, 2nd Lieut. Walter G. Eagle.

New R. M. A.s

The following officers of the Air Service have recently been rated as Reserve Military Aviators: Capt. Jacob S. Schlussel, 2nd Lieut. Stanton T. Smith, 1st Lieut. James C. Fair, 2nd Lieut. Ferris F. Hamilton, 2nd Lieut. Russell F. Swift, 2nd Lieut. Henry C. Fisk, Jr., 2nd Lieut. C. J. Fuller, 1st Lieut. Sydney H. MacBey, 2nd Lieut. Wm. L. Fancher, 2nd Lieut. Hugh F. Porter.

THE AMERICAN ACES

Washington.—Captain Edward V. Rickenbacker of Columbus, Ohio, famous an an automobile driver, was the premier "Ace" of the American air force in France, having twenty-six enemy planes to his credit. An official report received at the War Department showed that there were sixty-three "Aces"—men who had downed five or more enemy machines—in the American Army when hostilities ceased.

First Lieutenant Frank Luke, Jr., of Phoenix, Ariz., who was killed in action, was second on the list of "Aces," with eighteen victories to his credit, and Major Victor Raoul Lufbery of Wallingford, Conn., also killed in action, was third with seventeen victories. Before joining the American Army Major Lufbery was a member of the Lafayette Escadrille.

Captain Reed G. Landis of Chicago and First Lieutenant David E. Putnam of Brookline, Mass., who was killed in action, had twelve victories each. The other "Aces," with the number of victories credited to each, follow:

First Lieutenant Fields Kinley, Gravette, Ark., 10.
First Lieutenant G. A. Vaughn, Jr., 441 Washington Ave., Brooklyn, 10.
First Lieutenant J. M. Swaab, Philadelphia, 10.
First Lieutenant T. G. Cassady, 9.
First Lieutenant C. E. Wright, Cambridge, Mass., 9.
First Lieutenant W. P. Erwin, Chicago, 9.
Captain E. W. Springs, Lancaster, Penn., 9.
First Lieutenant H. R. Clay, Jr., Fort Worth, Texas, 8.
Major J. A. Meissner, 45 Lenox Road, Brooklyn, N. Y., 8.
Captain Hamilton Coolidge (deceased), Boston, Mass., 8.
Captain G. De F. Larner, Washington, D. C., 8.
First Lieutenant P. F. Baer, Fort Wayne, Ind., 8.
First Lieutenant F. O. D. Hunter, Savannah, Ga., 8.
First Lieutenant W. W. White, 541 Lexington Av., New York City., 8.
Second Lieutenant Clinton Jones, San Francisco, Cal., 8.
Captain R. M. Chambers, Memphis, Tenn., 7.
First Lieutenant Harvey Cook, Toledo, Ohio, 7.
First Lieutenant L. C. Holden, 103 Park Av., New York, 7.
First Lieutenant K. H. Schoen (deceased), Indianapolis, Ind., 7.
First Lieutenant W. A. Robertson, Fort Smith, Ark., 7.
First Lieutenant L. J. Rummell, 798 South 11th St., Newark, N. J., 7.
First Lieutenant L. A. Hamilton (deceased), Burlington, Vt., or Pittsfield, Mass., 7.
First Lieutenant J. O. Creech, Washington, D. C., 6.
Second Lieutenant Howard Burdick, 175 Remsen St., Brooklyn, N. Y., 6.
First Lieutenant C. L. Bissell, Kane, Penn., 6.
Major H. E. Hartney, Saskatoon, Canada, 6.
Captain Douglas Campbell, Mount Hamilton, Cal., 6.
Captain J. C. Vasconcelles, Denver, Col., 6.
Captain E. G. Tobin, San Antonio, Texas, 6.
First Lieutenant E. P. Curtis, Rochester, N. Y., 6.
First Lieutenant Sumner Sewell, no address, 6.
First Lieutenant R. A. O'Neill, Nogales, Ariz., 6.
First Lieutenant Donald Hudson, Kansas City, Mo., 6.
First Lieutenant M. K. Guthrie, Mobile, Ala., 6.
First Lieutenant W. H. Stovall, Stovall, Miss., 6.
First Lieutenant J. D. Beane (missing in action), 6.
First Lieutenant A. R. Brooks, Framingham, Mass., 6.
First Lieutenant R. O. Lindsay, Madison, N. C., 6.
First Lieutenant Martinus Stenseth, Twin City, Minn., 6.
Second Lieutenant F. K. Hays, Chicago, Ill., 6.
First Lieutenant H. C. Klotts, no address, 5.
Lieutenant Colonel William Thaw, Pittsburgh, Penn., 5.
Major D. McK. Peterson, Honesdale, Penn., 5.
Captain H. R. Buckley, Agawam, Mass., 5.
Major C. J. Biddle, Philadelphia, Penn., 5.
First Lieutenant James Knowles, Cambridge, Mass., 5.
First Lieutenant J. A. Healey, Jersey City, N. J., 5.
First Lieutenant Innis Potter, no address, 5.
First Lieutenant F. M. Symonds, 20 West 8th St., New York City, 5.
First Lieutenant J. F. Wehner (deceased), 124 East 28th St., New York, 5.
First Lieutenant J. J. Seerley, Chicago, 5.
First Lieutenant E. M. Haight, Astoria, N. Y., 5.
First Lieutenant H. H. George, Niagara Falls, N. Y., 5.
First Lieutenant G. W. Furlow, Rochester, Minn., 5.
First Lieutenant A. E. Easterbrook, Fort Flagler, Wash., 5.
First Lieutenant B. V. Baucom, Milford, Texas, 5.
Second Lieutenant Harold McArthur, no address, 5.
Second Lieutenant J. S. Owens, Baltimore, 5.

S. A. E. Program Taking Shape

New York.—The program for the winter meeting of the Society of Automotive Engineers to be held in the Engineering Societies Building, New York, February 4-6, is rapidly rounding into shape.

A discussion of the fuel situation will be led by President C. F. Kettering, who will summarize the situation to date with particular reference to the need for improving the thermal efficiency of engines. In addition, there will be an analysis of the supply of petroleum in the United States by a representative of the United States Geological Survey and a discussion of modern refinery practice. Dr. Joseph E. Pogue, of the Bureau of Oil Conservation of the Bureau of Mines, will present an interpretation of the fuel situation.

It is expected that that portion of the sessions devoted to aircraft matters will be of prime importance. J. G. Vincent, formerly lieutenant-colonel and chief of the aeroplane engineering division of the Bureau of Aircraft Production, will deliver a paper on engines of the fixed type with radially arranged cylinders. A paper on proportioning planes to their engines is in course of preparation.

A group of the enthusiasts at McCook Field, Dayton. Bottom row, standing—Ralph De Palma, Otto Summers, George Hecker, Guy Muntz, Pete Henderson, Sergt. Brigham, R. C. Sprague, Ben Spreng, Russell McDermott, Kern Aylward, Corp. Wiedenhoeft, J. H. Stukey, Frank Peck, A. F. Heywood, Corp. Markley, Wm. Moore, Del Golder, Ernest Longchamps, H. K. Reeve, Earl F. Dilgard, Sam Prince, E. A. Johnson, Sergt. F. F. Phlough, H. M. Shafer, Priv. Brinton, Bill Selleck, D. L. Long, Sergt. Tribbett, Capt. R. H. Depew, Harvey Ford; second row, kneeling—A. J. Barry, Bob Jandreau, Priv. Cassell, Corp. Kane, Wm. Beatty, Ralph Arment, Axel Christensen, Eddie Stace, Russell Shade, Carlo Capra, R. H. Werts, Priv. Leversey, George Bowman, W. Riedinger, Jr., O. H. Snyder, Corp. Burroughs, L. L. Gibson, H. F. Lawson, D. A. Lowry, John Isham, Steve Goodrich, Frank Hambly, Fred Golder, Jack Sutcliff; bottom row, sitting—Sergt. Robson, K. A. Performance of the Gallaudet D-4 Seaplane

In the December 30th issue of AERIAL AGE a description was given of the Gallaudet D-4 Light Bomber Seaplane, and mention was made of its speed. An illustration shown last week was from a photograph taken of the machine while it was traveling 126.7 miles an hour, piloted by Lieutenant E. F. Stone, U.S.N.

The list of performances given before (that is, maximum speed, 126 m.p.h.; slowest landing, 42.6 m.p.h.; slowest getaway, 46 m.p.h.; and climb in 2 minutes 2,100 feet) were officially observed results from actual flying tests, and not mere estimated calculations.

Moto-Meter Opens Detroit Branch

Detroit.—Following its policy of expansion, the Moto-Meter Co., Inc., Long Island City, New York, has opened a direct factory branch at 1432 Dime Bank Building, Detroit. The office will be in charge of J. J. Tobias.

New Livingston Radiator Corporation

New York.—The rights to manufacture radiators for automobiles, trucks and aeroplanes under the Livingston patents formerly owned by the Livingston Radiator & Mfg. Co. of this city have been purchased by the Livingston Radiator Corp. The new corporation also takes over all the mechanical equipment and processes of manufacture of its predecessor, and will place the production of this type of radiator on a quantity basis. A new management will have charge of the affairs of the new organization. The inventor, Dr. McRa. Livingston, again becomes associated with the manufacture of radiators under his patents, and will be vice-president and consulting engineer. E. G. Hines is president and general manager.

Doolittle with Sunderman

A. H. Doolittle has been elected secretary and general manager of the Sunderman Corp., Newburgh, N. Y. He was formerly sales manager of the Zenith Carburetor Co.

Brogan Leaves Duesenberg

Graham W. Brogan on Jan. 15th assumed the duties of advertising manager for the Black & Decker Mfg. Co., Baltimore. He was formerly advertising manager for the Duesenberg Motor Corporation.

Expect Keen Bidding for Army Planes

Houston.—There promises to be keen competition in bidding for the purchase of the 1200 aeroplanes and 2000 aeroplane engines, now stored at Houston, which the Government has announced it will sell on Feb. 1. Many of the men who will put in bids for aeroplanes are former army flyers, who want the machines for their private and business use. All bids will be opened at the office of the salvage branch, supply section, office of the director of military aeronautics, Washington, D. C.

The bids will be accepted on the plan of cash down before delivery, f.o.b. cars in Houston, and delivery promised within ninety days from the day the bid is accepted. Each bid must be accompanied by a check for 20 per cent of the proposal, and the Government reserves the right to reject any or all bids and also reserves the right to accept the bid on the unit basis. Bids will be accepted for one or more of the aeroplanes and the same applies to the aeroplane engines.

Returning Air Service Units

The battleship *Rhode Island* sailed from Brest January 2 and is due January 12 at Newport News, with the following troops: 477th Aero Construction Squadron, 4 officers and 150 men, Fort Slocum 48 per cent, Fort Logan 10 per cent, Fort McDowell, California, 10 per cent, miscellaneous 32 per cent; 6 casual officers classified as follows: Air Service 1, Field Artillery 1, Engineers 1, Infantry 2, Quartermaster 1.

The battleship *Virginia* sailed from Brest and is due January 12 at Newport News with the following troops: 484th Aero Construction Squadron, 5 officers and 145 men; Regular Army 98 per cent, miscellaneous 2 per cent and casual officer Air Service.

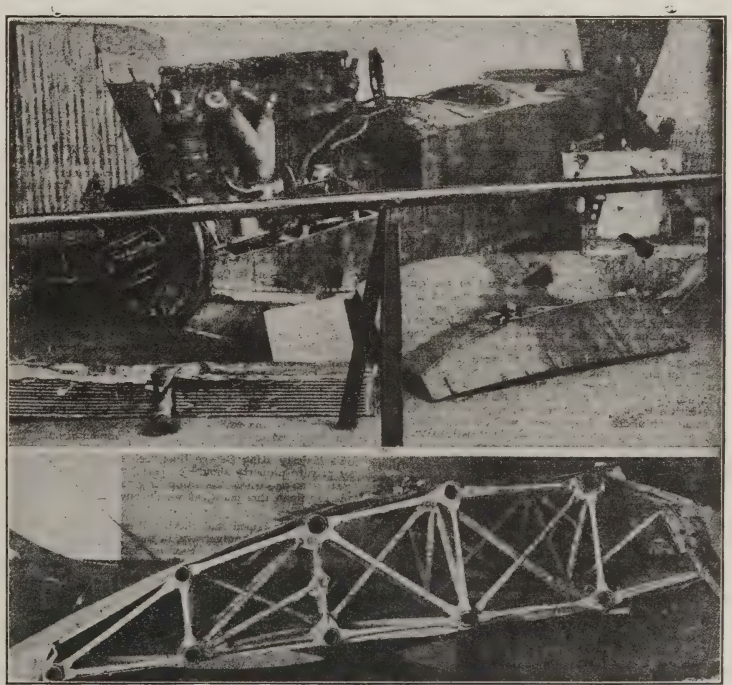
THE JUNKER ARMORED BIPLANE

FOR some time past there have been rumors current of a German all-metal aeroplane in which, it was said, even the wing covering was of metal. It is not, however, until quite recently that we have been able to obtain reliable information concerning this machine. What is left of the Junker biplane, as the machine in question is called, is now included among the many interesting exhibits at the Enemy Aircraft View Rooms at the Agricultural Hall, Islington, England, where representatives of the British publication *Flight* have been permitted to examine this machine in detail.

Owing to the damaged condition of the specimen on view it has not been possible to give, at present, more than a brief outline of the main characteristics of the machine. Later we hope to be able to describe it in more detail.

The Junker armored biplane is designed for use as a trench fighter, and in contradistinction to the A.E.G. armored biplane it was evidently designed with this object in view from the start, the armor not being attached, as a supplement, to an ordinary girder structure, as was the case with the A.E.G., but forming the main fuselage structure at the same time as providing the armoring.

The shape of the front portion of the fuselage may be seen in one of the accompanying photographs. It has flat sides of armor plating, and a slightly curved top of aluminum. The bottom of the body is formed of three flat surfaces, the middle one of which is horizontal, the other two sloping so as to connect the edges of the horizontal bottom with those of the vertical sides. The engine, a 230 h.p. Benz, is also protected by armor plating, which is detachable so as to allow access to the engine. This is accomplished by hinging the armor at this point, the port and starboard engine armor being separately detachable. In the accompanying photograph the engine armor of one side will be seen lying on the floor in front of the fuselage. The armoring is finished off just behind the gunner's cockpit, where it is continued across the fuselage by a curved armor plate shaped to form the gunner's back rest.



Of the rear portion of the fuselage nothing remains on the machine examined, and nothing can therefore be said regarding the details of its construction. Judging from such evidence as fittings for large diameter tubes at the four corners it would appear that the rear part of the fuselage has been built up of a tubular framework of Duralumin.

The wings of the Junker are of great interest as being a construction very dissimilar to any so far seen. The internal construction of the wings is in the form of Duralumin tubes crossing diagonally and connecting the tubular spars, which latter are far greater in number than is ordinarily found in an aeroplane wing. It has evidently been the aim of the designer to distribute the spars over the wing section rather than to provide two spars located in the usual manner. In the Junker there may be said to be six spars, if one counts the top and bottom tubes lying vertically above one another as one spar. The lower photograph will give some idea of the general distribution of the various wing members.

In section the planes of the Junker are enormously deep, the maximum thickness of the top plane being about 16 in. The chord of this wing is a little over 8 ft., while the chord of the bottom plane is approximately 5 ft.

From the fact that no trace was found of inter-plane strut fittings, it would appear that these members have been dispensed with in the Junker. It appears that the top plane centre-section was carried on a structure of tubes from the body, while the bottom plane appears to have been attached to the bottom of the fuselage by a series of diagonal struts. This arrangement, which would be made possible by employing such a deep wing section, would have the advantage that the gunner could fire forward at a considerable angle without danger of hitting a vital member of the wings.

The undercarriage is in the form of two Vees, attached to the lower plane some distance out. From this point the bracing tubes of the bottom plane run to the body, thus transmitting the shock to the fuselage without, presumably, causing excessive bending stresses in the lower wing spars.

Two views of a wrecked machine, showing the construction of the Junkers Biplane

Aerial Mail Service

In the course of his Annual Report, Postmaster Burleson discusses the aerial mail service:

The report discloses a program for the very wide extension of the aeroplane mail service, which has been successfully operated between Washington, Philadelphia, and New York since May 15, 1918. Though the subject of air service had previously been given considerable study and a number of spasmodic flights with mail had been undertaken for purposes of exhibition, it was only with the establishment of this route that transportation of mail by aeroplane became a permanent and practical feature of the Postal Service.

The Aerial Mail Service was inaugurated with the cooperation of the War Department, which furnished the machines and aviators and conducted the flying and maintenance operations. This cooperation, which was of inestimable value, was maintained until August 12, when the entire operation was taken over by the Post Office Department and the work performed by this department with its own equipment and personnel.

This program directs, first, the establishment of an aerial-mail service connecting the principal commercial centers of the country by a system of trunk lines and feeders, and, secondly, connecting this country with the West Indies and Central and South America. The trunk lines and feeders decided upon under this program are:

1. New York to San Francisco, with feeders from—
   (*a*) Chicago to St. Louis and Kansas City.
   (*b*) Chicago to St. Paul and Minneapolis.
   (*c*) Cleveland to Pittsburgh.
2. Boston to Key West, with feeders from—
   (*a*) Philadelphia to Pittsburgh.
   (*b*) Washington to Concinnati.
   (*c*) Atlanta to New Orleans.
3. Key West, via Habana, to Panama.
4. Key West, via the West Indies, to South America.

On this program I have to report progress as follows:

1. *Boston to Key West.*—Of this route the Washington-New York division has been operated since May 15 and is functioning perfectly.

The Boston-New York division has been tentatively laid out and will be established whenever, in the opinion of the War Department, its operation will not conflict with the war needs of the country.

The Washington-Atlanta and Atlanta-Key West routes are now being worked out with a view to their immediate establishment at the close of the war.

2. *New York to San Francisco.*—Of this route the division from New York to Chicago has been carefully worked out. The War Department, under act of Congress of July 2, 1918, has released to the Post Office Department, for the use of this division, aeroplanes of 650 pounds mail-carrying capacity which are no longer suitable for war needs. The hangars have been ordered, landing fields obtained, and the route has been ordered established before the close of the present year. In a series of aeroplane flights by the Post Office Department early in September, the route was carefully charted for emergency and regular landing fields. In this work one aeroplane made a record flight from Chicago to New York in less than 14 hours, including all stops en route. The flights were made through storm and heavy rains over parts of the route. The reconnaissance developed that it will be feasible to maintain a daily 9-hour schedule between New York and Chicago, as compared with the 21-hour schedule of the Twentieth Century Limited. The New York-Chicago schedule for the present will call for departing from New York at 6 a. m. and arriving at Chicago about 3 p. m., thus connecting with all city deliveries. The principal mail stop will be Cleveland. The time between Chicago and Cleveland will be cut to 3 hours 45 minutes, and between New York and Cleveland to 5 hours 15 minutes. Mail from the Atlantic seaboard will be advanced from 12 to 24 hours to the West and Southwest by this new service. The feeder routes from Chicago to St. Louis, Kansas City, St. Paul, Minneapolis, and the remainder of the trunk line from Chicago to San Francisco will be worked out during the ensuing year with a view to their immediate inauguration at the close of the war.

3. *Key West to Panama,* and

4. *Key West to the West Indies and South America.*—Negotiations looking to the conclusion of special aerial mail conventions between the United States and the foreign countries involved for the establishment of these routes to the West Indies and Central and South America are now in progress. It is realized that these oversea routes will require the most powerful aeroplanes with wireless installation and special construction to make them safe over the seas, but the enormous commercial advantage that will result by materially reducing the time between this country and Central and South America will justify the expenditure that such a service will entail.

In the conduct of the service now in operation and the preliminary work on the routes to be established immediately upon the termination of the war, the Post Office Department is receiving whole-hearted support from the War Department, Navy Department, National Aeronautical Advisory Board, Bureau of Standards, Weather Bureau, and Geodetic Survey, besides much local assistance from committees, individuals, and aero clubs in this country.

New Special Six-Cent Stamp for the Aeroplane Service

The official record from the Office of Third Assistant Postmaster General describes the new special six cent stamp issued for the aerial mail service.

1. Postmasters and other officers and employees of the Postal Service are notified that the department is issuing a new postage stamp of 6-cent denomination. It is intended, primarily for the aeroplane mail service, under the new rate effective December 15, 1918 (Postmaster General's Order No 2415, of November 30, 1918), but will be valid for all purposes for which postage stamps of the regular issue are used.

2. A description follows:

The stamp is rectangular in shape, about seven-eights inch long and three-fourths inch high; color orange. The central design is a mail aeroplane in flight. Above, in a curved line of Roman capital letters, are the words "U. S. Postage." Triangular ornaments appear in the two upper corners. Below the aeroplane, in a straight line of Roman capital letters, is the word "Cents," with the numeral "6" within circles in two lower corners.

3. To obtain the new stamps, central-accounting and direct-accounting postmasters will draw requisition upon the department on Form 3201, writing the word "Aeroplane" on the line opposite the 6-cent denomination and complying carefully with sections 50 to 52, 57 and 60, pages 37 and 38, 1918 Postal Guide. Requisitions which disregard these instructions will be returned to postmasters for completion. Requisitions will not be made special, but will be filled in the order of receipt at the department.

4. The 16-cent aeroplane stamp will be available for special delivery fee and a single rate of letter postage (6 cents) on aeroplane mail. The 24-cents stamp will be available for aeroplane letters weighing in excess of 3 and not more than 4 ounces.

A. M. Dockery.
Third Assistant Postmaster General.

Cited for Distinguished Service

The commander in chief, in the name of the President, has awarded the distinguished service cross to the following named officers and soldiers for the acts of extraordinary heroism described after their names:

First Lieutenant James A. Healy, Air Service, 147th Aero Squadron. For extraordinary heroism in action near Grandpre, France, October 30, 1918. Becoming separated from his patrol, Lieutenant Healy, flying at an altitude of 600 meters, discovered an enemy plane (type Halberstadt) hiding in the sun 200 meters above him, which he attacked and sent to the ground in a spiral dive. He then engaged two other machines (type Fokkers), which had been attempting to attack him. He succeeded in outmaneuvering them, and finally shot down one of the Fokkers. He returned without a drop of gasoline in his tank. Home address, Mrs. Mary A. Healy, mother, 361 Union Street, Jersey City, N. J.

First Lieutenant Murray K. Guthrie, Air Service, 13th Aero Squadron. For extraordinary heroism in action near Andsvanne, France, October 1, 1918. Lieutenant Guthrie was a member of an offensive patrol of four planes, which was attacked far behind the enemy's lines by six German machines. One of our pilots was forced to withdraw by the failure of his machine guns, and two others were surrounded and overpowered. Lieutenant Guthrie fought the six enemy planes alone for 10 minutes and destroyed one of them. For the following act of extraordinary heroism in action near Montefaucon, France, October 4, 1918, Lieutenant Guthrie is awarded one bar: When the leader of his patrol was blown to pieces by a shell, Lieutenant Guthrie took command and attacked the formation of six enemy planes. Although he became separated from his companions, he succeeded in destroying one of his opponents.

For the following act of extraordinary heroism in action near Fontaine, France, November 4, 1918. Lieutenant Guthrie is awarded one bar; as flight commander Lieutenant Guthrie led his formation of six planes to the attack of seven enemy planes (type Fokker), six of the enemy were destroyed, one of which was sent down by this officer. Immediately following this combat he attacked and drove off four hostile machines (type, Fokker), which were about to attack one of our balloons. Home address, K. R. Guthrie, father, care of A. T. & N. Railway, Mobile, Fla.

First Lieutenant Lloyd A. Hamilton (deceased), 17th Aero Squadron. For extraordinary heroism in action at Varssenuere, Belgium, August 13, 1918. Leading a low bombing attack on a German aerodrome 30 miles behind the line, Lieutenant Hamilton destroyed the hangars on the north side of the aerodrome and then attacked a row of enemy machines, flying as low as 20 feet from the ground despite intense machine-gun fire, and setting fire to three of the German planes. He then turned and fired bursts through the windows of the chateau in which the German pilots were quartered, 26 of whom were afterwards reported killed. Next of kin, Rev. John A. Hamilton, father, 25 Buell Street, Burlington, Vt.

MANUFACTURERS' AIRCRAFT ASSOCIATION BANQUET

THE banquet of the Manufacturers' Aircraft Association at the Waldorf-Astoria on January 7 was a great success, with a thousand guests in attendance, as was related in last week's issue of AERIAL AGE. The speeches were enthusiastic and prophetic, and we have pleasure in presenting them this week in substantial part.

Toastmaster Frank H. Russell struck the keynote of the meeting in his introductory speech. He said in part:

"About two years ago my friend, Harry B. Mingle, had a brain throb; he thought that the half dozen aircraft manufacturers, if they would once get together, would find that each was not such a bad sort of a fellow, and that he was worth knowing better. The result was that the aircraft manufacturers' association was formed. It was a little body, within two months from the time it was formed; the Advisory Board for Aeronautics invited us to Washington to consider the question of preparation for the war, which at that time seemed inevitable. We went. The discussion there was, how many aeroplanes were going to be needed? Somebody thought we would have an army of a million men, and there ought to be at least an aeroplane for every thousand men; so that meant a thousand aeroplanes, and then possible two in reserve, so if half a dozen companies could make 3,000 aeroplanes, we would have done our duty and done it well. We had about 5,500 men at that time building aeroplanes in various parts of the country.

"But, with the arrival of the British Mission and a thorough realization of what the problem of fighting in the air meant, the demand grew from 3,000 aeroplanes to 25,000 aeroplanes, and our work began. At first we were a bit lonely, but automobile manufacturers throughout the country came to our aid, and as they came, if they were building aeroplanes, they were welcomed into our association and for well nigh two years we worked together, not as separate companies, not as individual organizations working for profit, but as one concerted unit, to produce the aeroplanes that our country needed.

"Our forces grew from a paltry fifty-five hundred men to the time of the armistice, one hundred and seventy-five thousand men and women.

"Were those men and women working industriously? The fall of 1918 found the country supplied with more motors and more aeroplanes than could be conveyed.

"The armistice came and everybody took a long breath, and we had a little meeting and said, 'Now let us have a victory dinner, a celebration for the little that we have done.' As we talked about it more, as we went back to our factories and heard of the possible cancellation of contracts, as we realized the number of people who had devoted themselves so faithfully to the service of building planes, we realized that the problem which we had before us had really only just begun. And so we changed the idea of our dinner from a little liberty, victory dinner to a dinner in which we could invite our friends, the army, the navy, our friends wherever they may be, who are interested in aeroplanes and in aeronautics and in the progress of this new art, to come together tonight to confer with us as a council of peace for progress.

"With that idea in view, our committee has selected tonight a number of speakers whom we believe to have the various points or lines of development most clearly in mind.

"To start our evening, I should have said in the beginning that we have a number of regrets —there are quite a number. Among them are those from the Secretary of War, from the Secretary of the Navy, from Dr. Charles Wolcott of the Smithsonian Institute, from General George D. Squier, from Colonel Sidney Waldron, from Orville Wright, and last from Pat O'Brien. He is on the way raising money for a trans-Atlantic flight, and we wish him luck.

"We have a very pleasant surprise, Colonel Bishop, a man who is already very well known throughout this country. In 1915 Colonel Bishop was a boy in Toronto, Ontario. He joined the Artillery, went into service, went from there to become an observation officer in the Air Service, was brought down, went back and nobody heard of him for five or six weeks; but when he reported for duty he was a full fledged aviator. In a matter of three months he had captured the military medal and the military cross. With a record of 72 machines brought down officially and 23 more reported."

Col. Bishop's Speech

Colonel Bishop was most cordially received. After dwelling on his war experiences and marvelous victories, he discussed the future of aviation. He said in part:

"Speaking of the future of aviation, one can only say that aviation has been made by this great war. At the beginning of the war it was a dream of the pioneer of flyers that flying machines should help to scout and do other work, and they did at the beginning of the war; but no dreams that those pioneer flyers could possibly have had could possibly picture the wonderful development which aviation has had during the past four years.

"Each month of the whole course of those four years new improvements and new machines have steadily come to the different fronts, and with those improvements and those new machines new work has developed for the aeroplane, and instead of, as was at first thought, an aeroplane would simply do scouting work and the odd bit of looking around here and there, it now takes part in every action in any kind of warfare, and no action is complete without its perfect cooperation.

"I feel convinced—and really I have seen aeroplanes do some extraordinary things—I feel absolutely convinced that the future of aviation is not in warfare; it is in commerce, and I think that the wonderful record the science of flying has had will be equalled and unsurpassed in the next few years by the development of commercial aviation. The first startling thing will be the trans-Atlantic flight, and as every man here knows, that is not far off, not for one machine, but for many machines. At the end of another year, I feel quite confident that scores of machines will have crossed the Atlantic.

"And a great number of men here tonight will doubtlessly take that trip. This trip will without doubt be done not only in the big machines, but in the small machines. Both of these types have their advantages for commerce. The general idea among the outside public seemed sometimes to be that the only machine fit for a commercial purpose is the big, many-engined machine. This machine undoubtedly has tremendous advantages in carrying weight, in going long distances, and by reason of its two, three or four motor engines, it may be more reliable; but the engines which have been turned out of late in your country, in England and France and Italy have shown us that single engine machines may now be reckoned upon to be absolutely reliable, and that a person flying a machine with one engine, one of the good ones, may rely on that engine not to let him down.

"This is undoubtedly the biggest step that flying has taken, because in the past the people were very frightened of flying over bad country, continually worrying (I have done it myself) of landing in corn-fields and like fields, woods and all sorts of things. Now with engines that one can rely on, we feel absolutely confident that it will carry you through. The little machine will be cheaper in every way, will, of course, not bring the same results with the one exception of speed, and it will always be the fast machine.

"The United States went into this war with a jump in every way, but with an extra jump as regards aviation. It headed with a bang; it seemed to feel that aviation was built for the United States, made for it. The first machine it flew flew in the United States of America. America is very, very proud of that, and she came after when she entered this war in the proper spirit."

Dr. Boynton's Speech

The Rev. Nehemiah Boynton delivered a rousing address and offered a splendid tribute to the late Colonel Theodore Roosevelt. Speaking directly to the boys who had been overseas, he said:

"You come home again, my comrades—for I am so proud that I can call you such—you come home again at a most significant and a most pathetic moment in our American life, a moment when two names are upon the lips of the entire world, and both of them Americans. One of them is being spoken of in the tender words of respect and of memory, a man with whom many may have disagreed in political fields, but concerning whom there isn't an honest American, of whatever party or whatever creed, but who will confess that a more genuine, a more sincere, a more patriotic spirit never graced the office of highest responsibility in our country, whose loss we mourn, and the influence of whose magnificent character and achievement will abide throughout the centuries, side by side with those of Washington and of Lincoln. He speaks an earnest word to every lover of his country, a word which is particularly significant at this time, and that word is: The necessity on the one hand of genuineness of personal character, and on the other of everlasting watchfulness, with relation to the rights and the interests of our country and of our Allies, lest in the genial and relaxing attitude and temptation of these conquering days we after all lose that crown of victory which we have won upon the arena of war.

"He reminds me in his character of a line from Richard Watson Gilder, which may well be quoted at this time:

> When to earth I must,
> Where the fathers sleep,
> When fulfill the trust,
> And the mourners weep,
> When, though free from rust,
> The sword has lost its worth,
> May I bring to earth
> No dishonored dust.

"And the other man lives in the thought of the entire world today because of the majesty of the undertaking which is his. Saturday was a wonderful day, if you think of it, it was the day when the *Mauretania*, the sistership to the *Lusitania*, whose sinking revealed the character of the Hun—to which you referred, Colonel, a moment or two ago—and among the list of the cabin passengers was a little company to which I call your attention. There, together with his wife, is one of the wealthiest citizens of New York, over there is one of the most outstanding bankers of

The banquet of the Manufacturers' Aircraft Association, held at the Waldorf-Astoria on January 7, 1919, at which a thousand aeronautic enthusiasts, army, navy, civilian and industrial, were present. (Photo by Drucker)

the city of New York. There is a man whose name is known throughout the entire country, not for his wealth, but for the philanthropy of his spirit, and they are but samples of a little company of a dozen people who are sailing away from our shores tonight in order that they may go to the near East, where the outrages have been so dreadful, and where the needs so absolutely pathetic today, in order that by personal examination of the situation, they may come back and say to us Americans, what we must further do in order to show that spirit of friendship to a depressed race, which it is our boast to have set up in these splendid ideals which we have declared have been those for which we and our brave Allies have been struggling in this last tremendous encounter.

"And that ship the *Mauretania* could almost have crossed the cable which was bringing a word under the sea from the President of the United States to the Congress assembled in Washington, asking them immediately, because of the stress of the situation which obtains in many neutral nations who are our friends to send at once a hundred million dollars, in order that by clothing the naked and feeding the worthy poor we may give another practical demonstration of our abiding faith in that principle of friendship which we are setting up in the world."

Mr. Marshall's Speech

Mr. H. Snowden Marshall, who investigated the aircraft situation in the spring, was the next speaker. He said in part:

"On the eleventh day of last November the production of aircraft in this country had gotten under full swing. The whole force of the country had gotten back of it, it was approaching —although it had not yet reached the very top of the speed that it was approximating.

"I am told that on that day there were aircraft in this country that could not be shipped abroad for lack of ships. On that day, in the foot race that was going on between Mr. Ryan and Mr. Schwab, Mr. Ryan had forged ahead almost a lap, and I understand had turned around towards Mr. Schwab and placed his thumb upon the end of his nose and extended his fingers to Mr. Schwab, making a sign, gentlemen, that was classical many years ago.

"Now, because that success had been reached, because everything had gone so well, and because this country was taking a great pride in its manufacturers of aircraft, I think perhaps you will be glad to have me dig up the dry bones of the past and tell you how bad it was, or was thought to be, not quite one year ago.

"It will be a pleasure, perhaps, to hear about it, because the contrast is so keen and clear, and the success has been so great that the memory of what people used to say about you, about the manufacturers of American aircraft, the memory of the bricks that were slung at you, is a pleasure now to think of it.

"Last March, I would say, was the time when the blackguarding of aircraft manufacturers got its zenith. Every editor who had anything to spatter, spattered you. Every fellow who wanted cheap notoriety abused you. The most remarkable men, from the most remarkable sources, appeared in public places posing as experts in aircraft manufacture and chucked bricks at you.

"Now, the torrent of abuse got so great that this committee was appointed, of which I happen to be a member, and it was thus that I theretofore entirely innocent of any knowledge of aircraft manufacture became introduced in some degree to what was going on at that time.

"Well, the first thing I walked into was a fight. There was the most tremendous lot of vituperation going on, the most blasphemous charges of fraud, of treason, of profiteering; there was a sort of a general impression on the part of some newspaper men at least that every factory for aircraft was infested with German spies which tore down the work as fast as it was put up. It is so happily forgotten, but that was the state of the public mind at that time.

"Now, the uproar that was going on made it difficult to find the truth, the investigation which we made was necessarily as hurried as we could make it, the time pressed, it was necessary to dispose of a lot of foolish charges, it was necessary to find out what the country could do and what the country could not do, and the report which we made had necessarily to be confidential, because the efforts that we had made to find the truth disclosed what we though was the absolute truth, and of course that was the thing which of all other things would be best appreciated in Berlin.

"But I think I will be violating no confidence at all if I say that every member of our Committee, after going up and down and all over the country and looking at all of the people and discussing things with the manufacturers, and with the Signal Corps, and with everybody concerned, unanimously formed the opinion that there was no truth whatever in the false and libelous charges that had been made against the body of the people who were working on this, but that we had been in contact with an able, a patriotic, and an honest body of men, who were striving under the great handicaps, to accomplish a great good for their country.

"Now, I have been asked here of course to talk of the past, but I can't help thinking of the future. The problem we have here now is a pretty big one—it isn't as big as the one we had before, and as we solved the last one I am sure we will be able to solve this one; but here we have aircraft turned out in quantity, talented, skillful manufacturers able to turn aircraft out. It is a certainty, as sure as people can be of anything that they don't know, that the time is near when the production of aircraft will be a most important thing, commercially and in every other way in this country, and we have come to a stop. Are these manufacturers, are their plants to be dismantled? Are we to let this great industry that was born in America leave here again? The only customer, the only present customer, is Uncle Sam. The commercial or other uses of aircraft have not yet developed, but it seems to me it would be an awful pity if we slumped back into the state in which we were before, and left to other countries, left to countries across the water, the development of that industry that belongs to the United States by right of discovery."

Mr. John D. Ryan, former Director of Aircraft Production, delivered a brief address. He said:

Mr. Ryan's Speech

"I was called in the aircraft production at a time, as Mr. Marshall says, when there was a great deal of discussion, a great deal of criticism, and a great deal of blame; and I say to you tonight in all earnestness most of it was totally and entirely undeserved.

"Aircraft production had to start at the beginning. It had to find a way from nothing, to meet the demands of the American people, and brought to a point that was beyond all reason. People talked of clouds of aeroplanes, of tens of thousands of sparrows, and it was just as impossible to realize that dream as it was to realize any kind of a dream. Aircraft had to be built slowly, carefully, it had to be built to conserve, first, the lives of those gallant boys who took these ships in the air. They had to be made sure, every wrinkle, every crinkle, everything that could be a menace to the life of these boys had to be taken out of them, if it was possible, before they were sent to fight across the line, and they had to fight across the line. The work that was done before me made it comparatively easy for me to win a good deal of praise, as I say, that I was not entitled to.

"The work of my predecessors, the work of the aircart manufacturers of the United States, was a thing that, when I got into it and studied it, was amazing to me in its competency, and all it lacked was just time enough and just some organization to center it, to drive it in the direction, and to finish it.

"The manufacturers of this country, with singular devotion to the country, with great patriotism, and with the greatest earnestness that I have ever seen in any body of men, had built an organization for the manufacture of aircraft that certainly has never been equalled in the world, in the time in which it has been done.

"The brains that were in the aircraft organization at the time that I took charge of it had been well-directed, there were some things that might have been better done. There are things always that might have been better done, but in the main, in the mass, the work was well laid down, it was under way, and the manufacturers of this country who were making aircraft were doing a wonderful job, as far back as last May.

"I want to say that no association of my life has given me such great pride and such great pleasure as the association with aircraft manufacturers, with the Department of Military Aeronautics, with these boys who took our planes and proved them and flew them and fought them.

"When I went to France in September, our planes had only just begun to reach the front lines there were a good many of them there.

"In the first day of the fight at St. Mihiel, I went from one pursuit group to another and one observation group to another and talked with the boys and asked them how they liked the American-made planes. And I think these boys sitting here tonight will tell you even then, after they had had them only a comparatively short time, there wasn't a single man of them who did not say that they would not take any other plane of a similar type into the air, if they could get an American-built plane.

"The greatest effort necessary to build aircraft, as you gentlemen know, to start the building of aircraft, was in the building of the engines and is there anybody here tonight who doubts that the accomplishment of the American manufacturers of engines was one of the greatest accomplishments in the war, one of the greatest things done in the war? When the war ended, there wasn't a nation on our side of the war—and I am sure there wasn't one on the other—who would not take every engine we could build for them of the types we were building, there was not a single nation in the war that did not want more of what we were making than we could build for them.

"And we did not do so badly. From the time we began, we built more engines, and we built more planes, month for month, from the time we began, than any nation in the war built from the time it began. We had more engines ready, and we had more planes ready, month by month, from the time we commenced, than any nation in the war had month by month from the time it commenced.

"As Mr. Marshall said to you, it is no glory to me. I did not build it, as Dr. Boynton said to you, it struck a chord with me as he was concluding, he said he did not know anything about aeronautics, and neither do I.

"But the American manufacturers of aircraft, the American engineers, with their ingenuity, their brains, their patriotic devotion, the tremendous work they put into it, were building so well and even so fast that the day the armistice was declared there were six hundred and eighty-six American planes at the port of embarkation that could not be loaded. That was not the fault of the shipbuilders. Mr. Marshall gave us more credit than we were entitled to. But the reason for it was that while we were building a good many planes, a great many other people were building other things that General Pershing and the people on the other side wanted very badly, and they were taking trucks and ordnance and other things that they needed very badly, and leaving aeroplanes for the last few days, but the fact remains and we have it to our credit that we had more planes ready for them than they were ready to take.

"It was a great adventure, and we are all proud of it. I hope that what has been accomplished in aircraft, in war times, will be duplicated to a great extent in peace times. I haven't any doubt that there is a great peace future for aircraft. I haven't any doubt that the men whose brains, whose money, have been put into aircraft will go on developing it, perfecting it, making it so necessary to the life of the world, that the peace requirements in time will exceed the post-war requirements.

"I thing the peace requirements—and I don't believe I am over optimistic—will in time startle the world. I don't think it is coming today, and I should regret very much if it were pushed too much. I think with care and caution and development and trial that the aeroplane can be made as necessary in peace almost as it is in war, and I believe it is in good hands. I believe the manufacturers of this country, who are in the aircraft business today, will see it to their own interests to proceed cautiously, carefully, and make as few false starts as possible, develop it on broad lines and bring it to the fruition it deserves.

"I am out of the aircraft, as you all know. I am back a plain citizen, but I have great interest in it and its future. I should hate above all to see aircraft, particularly for the defense of the country, go by the board.

"I should think that it would be plain to almost anybody that in the necessity for the defense of a great country like ours, with a great coastline like ours, a very extensive aircraft program is a very desirable thing.

"I think the science of aviation should be encouraged in every possible way. I would have an academy of aviation, just as we have a military academy at West Point and a Naval Academy at Annapolis. I would educate the boys of this country from the time they are boys in aviation, strictly and almost exclusively, and I think that with the proper expenditure and the proper direction, that within five years from now an enemy fleet that attempted to reach the shores of the United States would be detected and located so far out at sea that it would be put out of business three or four hundred miles beyond the reach of the shore.

"I don't think there is anything in the nature of a dream about that. I don't think that anyone who studies what has been accomplished in aviation, and who thinks what might be accomplished, can consider that at all a dream.

"We now have planes that have a long range, we will have planes with a longer range, not necessarily the fastest planes, but planes with a long range that could absolutely detect the presence of a hostile fleet on its way to these shores, at least five or six hundred miles before they could reach us. Not deprecating in any way the great naval defense that we want in this country, and that we must have, I would say the planes could locate the fleet and the navy could destroy it, it could be told where it was and destroyed before it could reach us.

"I think it is a great pity that the brains in the aircraft organization, naval, as well as in the army, should be scattered. I think that the civilians who have come into this work, able engineers who have gone so far in this work, should be used, should be kept, should teach the younger generation all they know, pass it along, and that these great organizations that have been gotten together under the stress of war should not be dissipated and go back to their civilian employments without leaving with the country the benefit of all they have learned.

"I think that the great manufacturing organizations should not be destroyed, or allowed to fall into disuse. I don't advocate the building of great numbers of aircraft for military purposes. I don't think it is necessary. But I think that sufficient encouragement and employment can be given to the well-developed aircraft factories of this country, to keep them in the aircraft business, to induce them to make every discovery, to do everything they can to promote the science of aircraft. The organization should be kept intact, the men who are able and who have done this thing, should be kept together as far as possible. It would be a small expense, and God knows, it might be a great measure of economy some day.

"It has been a great thing to be identified with the development of aircraft during this war. As little as some of us have had to do

with it, it is a thing that we will be proud of to our dying day. To be associated with you men who have done this wonderful work in the building of aircraft, to have served these boys who have carried our craft across the enemies' lines, and they had to go across the enemies' lines because he couldn't come across ours—who have destroyed him, has been a thing that one can hand down to his children with great pride."

Lieut. Emmons' Speech

Lieutenant H. H. Emmons, U. S. N., who is in charge of the Aircraft Engine Division of the Bureau of Aircraft Production, and who performed his duties so excellently in that capacity, said:

"The first thing is that this war is the first war in history that has called for a large amount of industrially made material different from any preceding war. Other wars have depended upon men and wagons and some artillery and the things that go with them. This war developed into a scientific fight, which called for an enormous amount of new industrial material, of many different kinds and types, such as aeroplanes and engines and tanks and gas and flame projectors and chemical work, and electrically heated clothing, and instruments by the score, and things that never before had been used in any fight since the history of the world began.

"Therefore, industry and manufacturers were called upon to produce this material as something new. Now, the first thing I would like to ask you to remember is, just consider and look over this list of things and find out how much of it got to the front in time for the final fight, and you will find that there were more aircraft, more engines, and more brains there than there were of any other kind of new industrial material made for this war.

"Now, that was made by the members of this Association and others who are not closely connected with it, and who are not here to-night.

"Now, having that in mind, I want to give you a few figures, ordinarily they are very dry, but I think these will interest you, as to what was actually produced by this aircraft crowd, and when I speak of manufactures, gentlemen, I include not only you who were working in the factories but I include the unfortunate members of your fraternity who were chosen to go to Washington and represent the Government. You want to thank your lucky stars that you were permitted to stay in your own plants and work, you might have been one of those victims that was chosen to go there and represent the Government.

"There were a number of them chosen to go and do that work, and you all know, it isn't necessary for me to say to you, that there never was a higher-minded, better-principled, harder-working group of men put on any job than those men in that aircraft work.

"They were not super-men, they were men like you and as I say, you might unfortunately have been one of them, but luckily you were not. As soon as they got there, they were oppressed with all kinds of assistance from every person on this side of the water and on the other, who thought he knew anything about this subject. Each man said, 'Make my machine, or my engine, don't make this one'; the other fellow said 'Make an American engine,' the other man said 'Don't do this, make a foreign engine'; everyone had a different idea, and he wasn't slow about expressing it.

"The situation soon became like it was in the section gang that found a great big rock on the railroad track. There were three Irishmen in the crew; one fellow said 'Let's take our pick and get it off'; the other fellow said, 'No, the way to get it off is with the shovel'; the third fellow said, 'Take my crowbar and knock it out.' The foreman then said, "All of yez, throw down your tools and come around on the side with me and lift, and we will get it off." And the leader in the Aircraft Production Board at that time said the same thing to everyone, 'Come around and lift with me, we may not get the very finest way to do it, but we will get it done in some way.' And it was done.

"Now, gentlemen, this is what you did. The requirements of the aircraft were of two classes, first for training; second for combat. For training we had already in America two engines that could do the work, the Curtiss and the Hall-Scott. There were others that could have helped, but time didn't suffice to enable us to use them. There were planes to go with them, and we adopted these two and pushed the production of them, with the result that the training planes were put in our fields, with something over 16,000 engines to fly them before the war was stopped.

"Now, to understand what that means, you should know what the situation was when this was started. For the eight years prior to 1916, the Army had ordered fifty-nine airplanes and had received fifty-four. During the year 1916, the Army had ordered three hundred and sixty-six planes and had received sixty-four. In other words, for the nine years prior to 1917, the Signal Corps of the Army had received the enormous sum of one hundred and eighteen aeroplanes. That was the equipment that they had had up to the date that we started this business, and that was all that they knew about them. Now, from that we had to start with a program laid down by the joint army and navy technical board, calling for over 9,000 training planes and over 20,000 combating planes, and you gentlemen who have made any of this material know what it meant to tackle a job of that kind.

"Now you made nine thousand of the training planes, you made the sixteen thousand training engines, and every one of them had been delivered and put into service, gentlemen, before the armistice was declared.

"On the combat engine side we were oppressed with the same multiplicity of advice. As a result of which it was determined to put our main effort upon the Liberty engine. I am not going into the arguments for or against it, I am simply going to call your attention to this fact, that on the nineteenth day of May the first stroke of the pen was made to design the Liberty engine, the first engine was built complete and delivered in Washington on the fourth day of July, less than six weeks, it was extended into a twelve-cylinder engine and the first one was built and passed the fifty-hour test by the twenty-fifth day of August of that same year and was pronounced a success and ready for production. We started to produce that engine which was rated at a horsepower of three hundred and thirty. When we had tooled and jigged up for it and gotten the factory ready and had produced several hundred of them we were told to increase the horsepower. It was boosted to three hundred and seventy-five, with the resulting changes in the tools and equipment. When we had made some four or five hundred of them we received our final instructions from abroad and I might say to you that most of the things you have felt disposed to criticize, you will find they were done by us because we were told by the authorities under whom we were working that that was what was wanted, and that we should do it. We received our instructions from the other side that if we could produce an engine of four hundred horsepower or upward, we would have the engine that would do wonders in 1917 and 1918. Many changes were required to get that large engine, and on the 29th day of May, 1918, one year after this engine was started to be designed, we had passed all those difficulties, had engineered and developed it, put it into a manufacturing proposition and delivered into service over eleven hundred of them.

"Now that is an accomplishment that never has been equalled in industry anywhere. Those of you who are familiar with the automobile business know that no automobile motor of any size or strength has ever been put into service without at least a year of experimentation and development on it. This Liberty engine had no such year of development before it was put into production and it did not need it for the reason that the design was proper when it was made. You have heard about changes on that engine. From the date it has been made until now there have been no fundamental changes on that engine. We have changed the oiling system, but there aren't any fundamental changes.

"The changes that you have heard about are of two classes: We know those were required by the two increases in horsepower that I have told you of, and the other the manufacturing changes that always are discovered in the process of production. And those are all the changes that have been made on this engine during the time that it has been in production.

"Now from the 29th day of May until the armistice was declared the production of these engines jumped by leaps and bounds, until during the month of October the production of Liberty engines was 3876, or over 150 for every working day in that month.

"The total engine production of all types for the month of October was 5603, or over two hundred for every working day in the month, and as my friend Gen. Cormack told me, 5603 is more engines than were produced in any one month during the war by England and France combined. (Applause.)

"Now, we had, gentlemen, under contract for production, 95,995 aviation engines, at a total cost of engines and spare parts of over $450,000,000. We had them in production in the finest plants that are in the world for the production of machinery and particularly motors.

"On the 29th day of November, exactly 18 months after the first scratch was put on the paper to design the Liberty Engine, we had produced and delivered into service 15,000,000 Liberty, 12-cylinder engines. We had produced and put into service of all kinds of engines, training and combat over 32,000, that is over a third of the total that we had ordered built. Now, one may ask where those engines went, and it is quite interesting to know where they went because there has been some question asked about that.

"Of the Liberty combat engines, 5,000,327 of them went to aeroplane plants to be installed in planes, or to accompany those planes as spare engines, and over 3,000 of the D. H.4 planes with the extra engines had been produced and started for the front when the armistice was declared. Of these Liberty 4,511 had been delivered to the American Expeditionary Forces in France as engines only, not accompanied by planes. 3,742 engines had been delivered to the Navy and we had delivered to the English, French and Italians, 1,089 engines for their use, and we had put on our fields for the training of our aviators 907 of these Liberty engines. That will give you some idea of the extent to which this production had gone. By January of this year we would have been producing over 6,000 aviation engines of the Liberty type per month, and by April of this year we would have been producing 10,000 engines per month of every type. That is what the manufacturing interests of this country have done.

"Now, that is only one item of production in the Bureau of Aircraft Production work. I might tell you about balloons. The balloons are wonderfully interesting things. We had delivered over 700 of them by the time the armistice was declared. Our balloon companies went from the ships direct to the front, thoroughly equipped and prepared both as to men and material and took their place on the line at once. So that the country and the manufacturers of them in aircraft work have a right and ought to understand that the work that they have done has been absolutely marvelous, and that this criticism and talk and blackguarding that we have been subjected to is entirely uncalled for and it doesn't make any difference what source it comes from.

"Now, the manufacturers of the country have not had their due from this. We have heard about the millions and the billions of profits that these profiteers are going to make. We all know that this is incorrect, that the manufacturer who comes out of this work even is doing a very handsome thing by himself, under these circumstances. But we all know, and we should all hold it in our own remembrance, for our own satisfaction, if no one else will believe it, that whenever the necessity arises for the manufacturing interests of this country to come forward again, if the time ever comes when anybody else arises and says that by sheer brute force and bestiality he is going to try to override the right and justice of the world, the manufacturing institutions of this country stand ready to come forward and sacrifice themeslves again and do their part as they have done this time!"

Second Assistant Postmaster Otto Praeger discussed the aerial mail service. He discussed the various types of machines which he anticipated the industry would be required to build for his special work.

Planes Visit Aborigines

Army pilots at France Field, Cristobal, Canal Zone, Panama, are required to do much of their flying over water and along the coast. A flight to the Gulf of San Blas, consuming three and one-half hours, was recently made by two R9 hydro-aeroplanes.

The Gulf of San Blas is situated on the Atlantic Coast about one hundred miles southwest of France Field. The mainland and numerous islands in and around the Gulf are inhabitated by Indians, who are suspicious and unfriendly and decline to trade with strangers. In view of this information it was not contemplated stopping here, but due to the overheating of one of the motors a landing was made and the machine beached on one of the most populous islands. None of these people had ever seen nor probably ever heard of a flying machine, and great consternation was manifested when the ships taxied up to the village, while from all the neighboring islands there were sent numbers of small dugouts.

It is doubtful who was the most fearful on this occasion, for when the begoggled pilots stepped from their machines the entire population of the island was lined up on the beach, armed to the teeth. The headman very reluctantly took his place in front of this aggregation and greeted the visitors with a scowl and a machette in his left hand. One of the pilots was a new arrival in Panama and unfamiliar with the current yarns about the unfriendliness of the Indians. As soon as he stepped on the beach, he rushed up and greeted the headman in a very effusive manner and fortunately his friendly smile was properly interpreted. Most of the men were half naked and the boys entirely so. The costume of the women was both picturesque and very uniform. Bare feet were in vogue, the ankles and calves wrapped with a reddish string fiber, while short red dresses of the same material and without sleeves reached to the knees. The majority of the women wore large gold rings in their ears and noses and in many instances necklaces and bracelets of attractive design made from sharks teeth. A camera was brought out, but this aroused such a feeling of hostility and suspicion that it was deemed advisable to return it to the ship. Some of the small boys mustering up courage came close enough to accept cigarettes, which they apparently enjoyed hugely, and finally the old chief himself grudgingly accepted one.

After this the pilots were permitted to go through the village proper, and by way of courtesy the chief was invited to come aboard one of the hydroaeroplanes, which invitation was not accepted. Radiators were filled with salt water and after a stay of about two hours the return flight was accomplished without serious trouble.

PLYWOOD IN AEROPLANE CONSTRUCTION

By HENRY HARRISON SUPLEE

IN view of the fact that the extensive use of laminated plywood is beginning to be considered seriously by the builders of aeroplanes in the United States, it may be advisable to review the extent to which this unsurpassed material has already been successfully employed elsewhere.

Notwithstanding the importance of other materials of construction which have been produced and used for all structural purposes, it still remains that, to use the words of one of the most eminent engineers and inventors of America, uttered with the results of an unequalled testing laboratory before him: "For all purposes in which its use is possible, there is nothing which can equal a good sound piece of wood."

For some purposes, however, wood, in its natural condition, is inapplicable. Large sheets, sawed or sliced from large logs, especially when thin, have little strength, save in one direction. Even if sound when cut, they can with difficulty be prevented from splitting and cracking; and this defect appears to a still greater degree when the sheet is rotary cut from smaller logs.

For some purposes, however, large continuous surfaces are required, and hence, for many years the makers of furniture, panels, and similar work have found it necessary, when such a surface is needed, to glue a thin sheet to a heavier backing. This method, having the further advantage of enabling a face of a fine wood to be placed upon a backing of inferior material, has led to a natural discrimination between such "veneered" surfaces and the so-called "solid" wood; a condition of affairs which may have had something to do with the prejudice which the uninformed man usually has against what is most incorrectly called "veneer."

Laminated plywood, called by the French *contreplaqué*, and by the Germans *furnier*, is apparently of Russian origin, and has nothing in common with "veneer" except that it is built up of plies of thin wood.

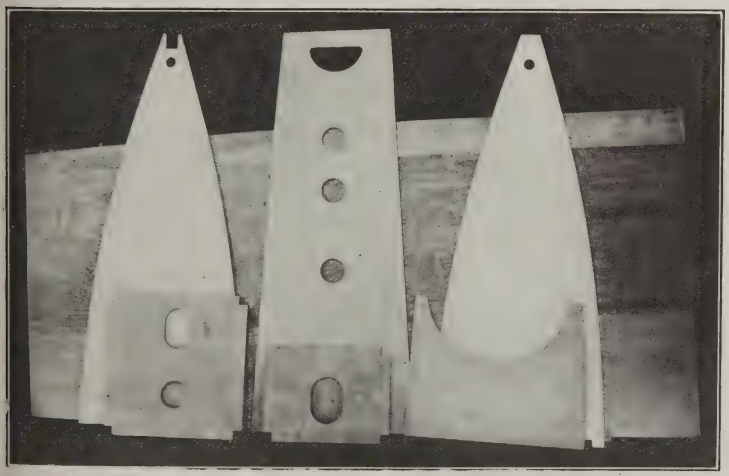
Ordinary glue, made from hide, bone, animal gelatine and the like, and soluble to a greater or less degree in water, or swelling and loosening on exposure to atmospheric humidity, is manifestly unsuitable for the production of a homogeneous and permanent structure of this sort, and hence it should never be used for any serious work. It is absolutely necessary that the idea of a number of sheets and fragments of thin wood, stuck together by any such adhesive, should be dismissed from the mind when the material "plywood" is under consideration.

True plywood is an *original product*, resulting from a *scientific process*, involving a correct and methodical sequence of operations, all depending upon each other, and all demanding immediate relations with each other. The elements of the original structure of the wood; the relations of the particular cementing material employed to the wood and to the atmospheric conditions of the moment; the temperature required to produce the chemical reactions between the wood and the cementing material, and within the cementing material itself; and the magnitude and duration of the pressure applied per unit area; all these form such a number of variables that no routine standardization is practicable, and only the exercise of individual skill, obtained under long experience, can produce a determinate result.

Any attempt to take somebody's glue, of unknown composition and reaction, and spread it over sheets of wood of unknown moisture content and indeterminate structure, regardless of weather conditions, whether hot or cold, moist or dry, and hold them together with an uncertain pressure for irregular periods of time, must obviously result in a nondescript material, wholly unfit, except by accident, for the severe requirements of aeroplane service.

When we consider the care with which the materials entering into the construction of the motor are specified, analyzed, and tested, we may gather some idea of the absurdity of neglecting like precautions for the material composing the structure which carries, not only that motor, but also the lives of men, the material of combat, and all the stresses of action in the air.

Plywood cowling above the pilot's and gunner's cockpits for the De Haviland "4," made by the Dodge Manufacturing Company, Mishawaka, Indiana



One of the highest authorities upon the subject of the union of materials by glues and similar cementing materials, Dr. Samuel Rideal, the eminent London chemist, states as an essential to satisfactory results, that:

"It is necessary to know the properties of the materials used, and the chemical and physical conditions at every stage of the process; these must be observed systematically."

It does not follow that there are any insuperable difficulties to be overcome in the manufacture of aeroplane parts of the highest character from laminated plywood; on the contrary, this material, during the recent years in which its production and applications have been perfected, has become a staple product in the establishments which have worked out the details and apparatus of the industry.

Laminated plywood, formed into shapes under heat and high pressure, with cementing materials which become insoluble in the course of the process, has been used in Russia for many years, notably in the works of the Russian-Baltice Wagon Company, Ltd., and its use extended thence into Germany in the products of the Deutsches Rohrplatton Gesellschaft; from which a knowledge of these special processes and equipment passed to the United States nearly twenty years ago. The process was used in Russia for the manufacture of wagon parts, tubes, containers, etc., and for similar parts in Germany, while in the United States it was developed especially in the manufacture of such containers as the well-known "Indestructo" trunks, as well as for special containers, flour bins, conveyor tubes, and the like.

Very early it was employed in Russia in airship construction, and more than thirty years ago Captain Kostovitch built a rigid airship, of the type later developed by Count Zeppelin in Germany. In-

Set of plywood sheathing for the fuselage stern, De Haviland "4," National Veneer Products Company, Mishawaka, Indiana

stead of using an aluminum alloy for the rigid framework of this dirigible, Captain Kostovitch employed formed shapes of laminated plywood, wholly waterproof, and extremely strong and light. This rigid structure enclosed seven balloons, filled with hydrogen, of an aggregate capacity of 9,000 cubic metres, and in construction and design anticipated the most recent rigid plywood dirigibles of the Zeppelin type built by the Schütte-Lanz Company in Germany.

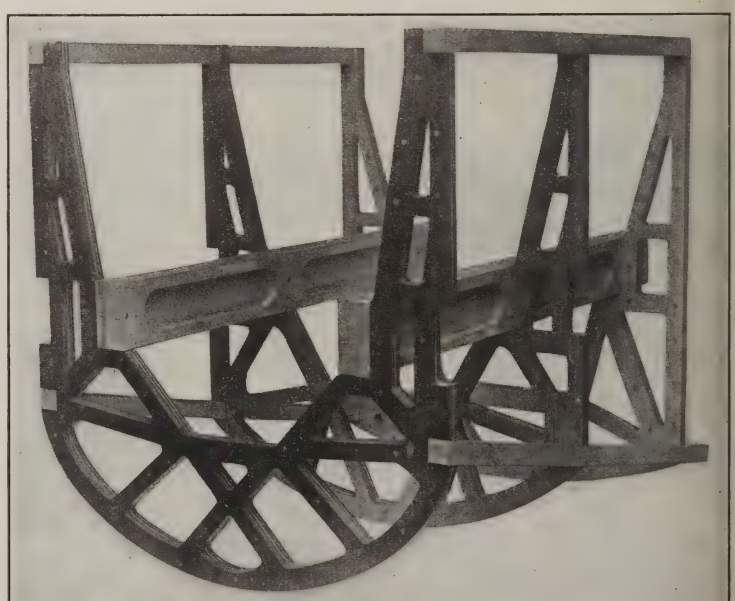
It was in 1910 that Sikorsky began his experiments in aeroplane building, and he naturally turned to plywood as a material well-known in Russia and available for his purpose. The work upon the large quadruple-motored Sikorsky aeroplanes, built in 1913 and 1914, was done in the works of the Russian-Baltic Wagon Company, and the entire fuselage of the first Sikorsky machine, the "Russky Vitiaz," was made of plywood, thus anticipating the developments of the German Albatross and Gotha machines by several years. In Russia, also, the first complete plywood aeroplanes were made by Steglau, in 1912, these remarkable machines being constructed wholly of plywood, including the wing covering, no linen whatever being used. The extreme rigidity of these plywood wings showed the superiority of the material for this purpose, and since the weight of the whole wing surface was no greater than the linen-covered skeleton of spars and ribs otherwise employed, the radical value of the construction became apparent.

In France, as early as 1909, Levavasseur had built a box-girder fuselage covered with sheet plywood for the Antoinette monoplane, but defective design caused this machine to be of insufficient strength, and its use was abandoned. Probably this improper use of plywood had much to do with the tardiness of the otherwise brilliant French designers in a wider use of the material.

In 1912, Béchereau, the able designer of the Deperdussin Company, produced a special machine for entry in the Gordon Bennett race. Realizing the immense influence of low aerodynamic resistance upon speed, Béchereau designed the so-called "monocoque" fuselage, shaped, as closely as possible, to the streamline form, to minimize the production of eddy currents and resistances. This body, or fuselage, was constructed over a mould by gluing successive layers of narrow wooden strips, with interlayers of linen, the successive layers of wood being laid in diagonally crossing directions, and the exterior smoothly finished. This machine, a monoplane, showed by its victorious performance, the great advantage involved in this form.

The building up of a fuselage according to the method of Béchereau has been successfully applied repeatedly in France and elsewhere, and the correctness of this design fully demonstrated so far as performance is concerned, but the difficulties of adapting the detailed construction to quantity production have led to other methods for attaining similar fuselage forms. In any case, such a fuselage, even when bonded together with plies of linen, or similar fabric, is not an altogether scientifically arranged distribution of material to attain maximum strength with minimum weight, and it is impracticable to bring to this construction the desirable elements of heat and pressure.

The earlier German Albatross machines were built after the prevailing French models, the fuselage being made up of four longerons, or longitudinals, trussed with short wooden and wire struts and ties, and covered with linen.



A plywood monocoque fuselage designed and constructed by the Dodge Manufacturing Company and submitted to the Signal Corps, U. S. A., in May, 1916. It is 17 feet in length and weighs only 86 pounds

In 1912, a German aviator, named Bier, visited Russia, ostensibly to give exhibition flights with one of these German Albatross biplanes, but it was afterwards proved that he was really an officer and investigator in the flying corps of the German army. Soon after the return of this officer to Germany the German Albatross Company began the use of plywood in fuselage construction, following, not the built-up system of Béchereau, but a method decidedly more correct, and doubtless derived from what had been learned about the plywood machines of Steglau and Sikorsky.

Instead of a unit monocoque, the streamline form of fuselage was produced by the use of four or six longerons, fitted over bulkheads or frames made of plywood, the whole being encased with sheets of plywood, formed to the tapering curves of the shape of minimum aerodynamic resistance, these plywood sheets being fastened to the longerons and frames by screws or nails. In this construction we see a distinct adaptation of the long-accepted method of boat design, modified to meet the requirements of form and the demand for lightness, and adapted to the most efficient utilization of plywood.

England and France continued to use the linen-covered truss construction, and the precedents thus created were followed in the United States, with little or no regard to what had been developed in Russia and Germany.

It is true that certain engineers in America, approaching the subject from a wholly independent viewpoint, produced and urged the use of fuselages built upon longerons and bulkheads, developing plywood fuselages of great strength and marked lightness and low aerodynamic resistance, while entirely unaware of the work which had been done in Germany. Plywood was even offered for wing-design, and full-size wing sections developed to demonstrate the applicability of the material and the weight possibilities. For more than two years such plywood construction was urged upon the authorities in the United States, with negative results, the experience of practical workers

The plywood construction of bulkheads and engine bearers for the De Haviland "4" battleplane

View showing the interior of a monocoque fuselage built by the Dodge Manufacturing Company. The frames, longerons, and skin are of plywood

in this line being ignored, while time and money were expended in uncertain and less-tried ways.

The extent to which the plywood fuselages of the later Albatross machines were able to resist punishment, and the good condition in which they landed, even when brought down under fire, was conclusive evidence of the superiority of design and construction of these aeroplanes. Owing to the manner in which the plies of the wood were laid up, with the grain of the sheets crossing and interlocking, the fuselages, even when riddled with holes, held well together, and even after apparently destructive falls were picked up whole and unceremoniously hauled away by their tails without coming to pieces; a marked contrast to the crumpled mass of kindling wood produced by a wrecked truss body.

The use of plywood on British and French machines is even yet unlike that of the better German aeroplanes, mainly because it is still endeavored to use the plywood in flat or slightly curved sheets, nailed on as a mere covering, and not formed and united in an integral part of the structure. Thus, in a certain British machine, a separate cowling is fitted on top of the longerons, while flat sheets, cut to form, are attached with screws to bulkheads and longerons. In like manner, an Italian pursuit machine, in many ways of admirable design and execution, does not realize the full value of the material. Even at the present time the prevailing tendency is to procure plywood in large flat sheets, and cut it up and try to bend it dry and cold into forms for which it is unsuited, this being clear evidence of the lack of grasp of the possibilities of a material so eminently adapted for original moulding and shaping.

A critical study of the use of plywood in the German machines becomes especially desirable in view of these facts. In the Albatross CIII or DI the manner in which the skin adds its strength and stiffness to the frame is worthy of close examination, while in the later Albatross Cv we see how the form of the fuselage is blended and curved off into the lower wings and into the vertical stabilizer in a way which reveals an intimate knowledge of the art of moulding and forming the plywood, giving at the same time strength, stiffness and minimum wind resistance.

It is interesting to note the extent to which the aerodynamic resistance has been reduced in these later Albatross machines, and increased speed obtained without material increase in powering. The 160-horse-power Mercedes or Benz engines have driven aeroplanes of this type at least 20 per cent. faster than was practicable with earlier forms and construction of fuselage. In some of these German machines the plywood skin is attached with cement-coated nails, instead of brass screws, a modification probably due to limitations of materials, but the general distribution of material and the efficient results attained reveal a wholly different appreciation of the real value of plywood from those who see in it merely one more material for covering.

It has been sought to secure a high grade of plywood for aeroplane construction by drawing up specifications indicating certain tests, such as soaking for hours in boiling water, or baking, etc., such requirements being apparently specified in ignorance of the fact that such prolonged temperatures add to, rather than detract from, the resistance of properly made plywood. No one wants to boil an aeroplane, and such a test is of no informative value as concerns the actual service to be rendered.

It is well known that one of the critical stages in the construction of a trussed fuselage is the process of "truing up," an operation of hours and men, a "tuning up" of wires and struts, of uncertain value and limited duration. A machine with a fuselage out of line is regarded as unfit for satisfactory service, and hence the care which is taken in the original alignment of the body, and the careful inspection and tuning given to machines with truss fuselages after flight.

A plywood fuselage, on the contrary, properly designed and

THE CHRISTMAS STRUTLESS BIPLANE

SEVERAL attempts have been made for years by experimenters to perfect an aeroplane with flexible wings, or following closely the flexibility of the wings of a bird. The biplane designed by Dr. W. W. Christmas appears to have met with much success in the structure mentioned, and his theories of flexing wings have shown more practicability than most rigid-wing adherents were apt to believe possible.

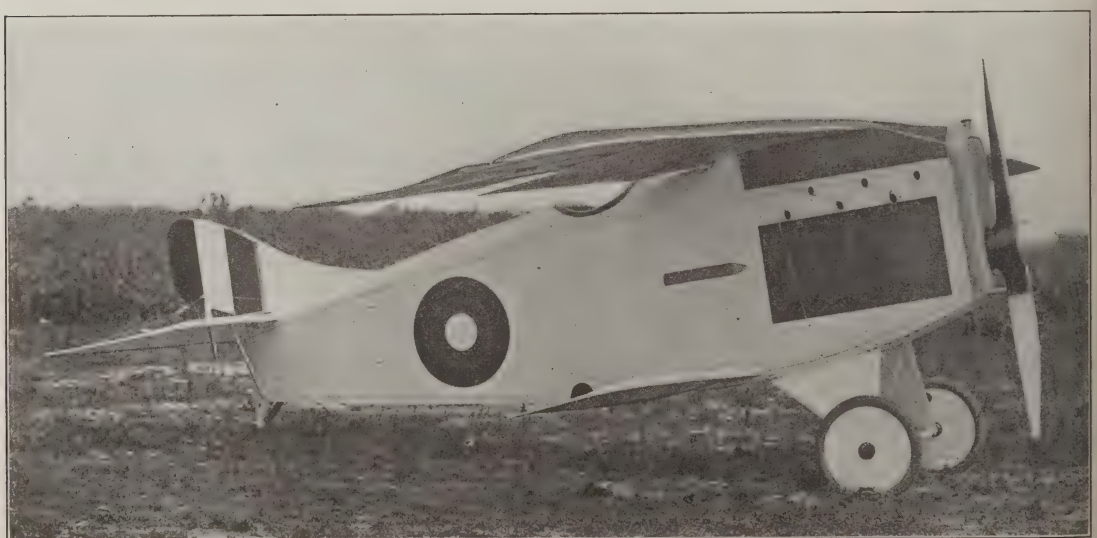
The British and French Governments have manifested considerable interest in this machine, probably because of reports of the great speed accredited to it.

A most radical departure from what has heretofore been believed to be necessary practice is the entire elimination of struts, cables, and wires in the bracing of the wings, as well as the absence of wiring in the internal structure of the wings. The wing curve is one developed by Dr. Christmas, and is of fairly deep section between the main wing beams, but tapering off sharply aft of the rear beam, and merging into a flat thin, flexible trailing edge. The effect of the section is to maintain a high angle of incidence as the machine is travelling at low speed, and a high angle as the machine gathers speed, flattening out the wing and presenting very little resistance.

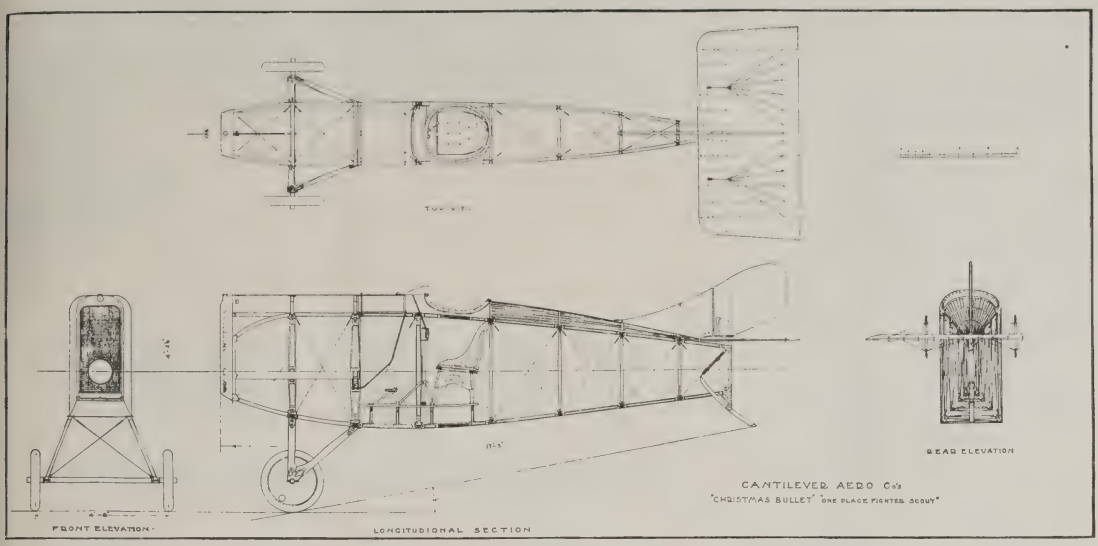
Upper and lower wings have the same aspect ratio. Upper wing has a thickness of 5 inches. Patents are pending on the wing construction, and full details cannot now be given of these features.

With the wing section used, Dr. Christmas has succeeded in obtaining a 72 per cent lift on the upper wing, a higher vacuum than found on any other section. Wings are set at an incidence of 3½ degrees.

As the wings are not braced transversely, flexibility is also obtained in that direction. Puffs of wind or sudden changes of direction, do not sharply affect the machine's progress, for the shock is transmitted only after being partially absorbed by the resiliency of the wings. It would seem that such construction would result in a low factor of safety, but the designer claims a safety factor of seven throughout.



When at rest on the ground, the wing droops in a negative dihedral of —17 degrees. In flight the wing tips have a range of flexibility of 3 feet; that is, the wings can assume positive or negative dihedral measuring 18 inches from the horizontal in either direction.



The Christmas "Bullet," in flight at Mineola, L. I.

It has been demonstrated that the wings carry a load no greater than necessary to sustain the machine in flight, and this load is carried regardless of wind puffs or extra strains due to increased wind pressure above or below the wing.

The principal specifications of the Christmas "Bullet" are as follows:

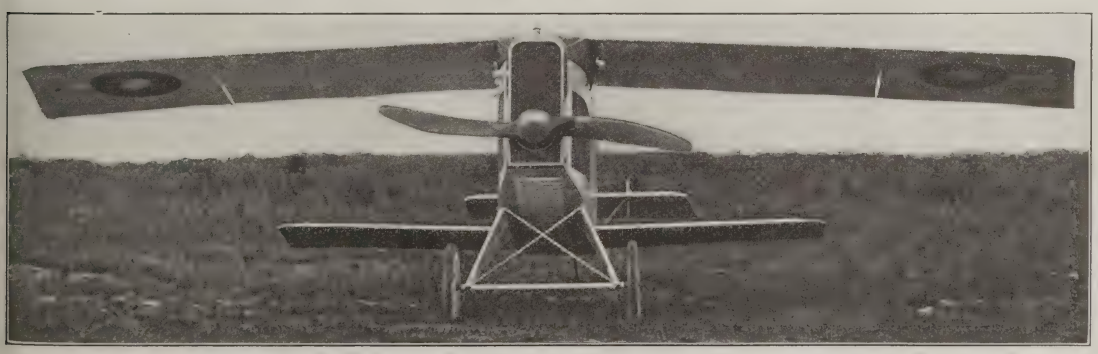
The Christmas "Bullet" strutless and wireless biplane which makes a speed of 170 miles an hour with a 6 cylinder Liberty Motor

Details of the fuselage and tail group of the Christmas "Bullet" strutless scout biplane

Span, upper plane	28 ft. 0 in.
Span, lower plane	12 ft. 0 in.
Chord, upper plane	5 ft. 0 in.
Chord, lower plane	2 ft. 6 in.
Area, upper plane	140 sq. ft.
Area, lower plane	30 sq. ft.
Length overall	21 ft. 0 in.
Weight, machine empty	1820 lbs.
Weight, fully loaded	2100 lbs.
Minimum speed	50-60 m.p.h.
Maximum speed	175 m.p.h.
Cruising radius	550 miles
Ceiling	14,700 ft.

A Liberty "6" is used, giving 185 H.P. at 1400 r.p.m.; the machine attains 170 miles at three-quarter throttle. The weight fully loaded is with 50 gallons of gasolene and 5 gallons of oil, sufficient for a sustained flight of three hours.

The "Bullet" was originally designed as a single seater fighter. The pilot has an unobstructed range of vision, as his eyes are at the level of the upper plane and the lower plane has such a narrow chord that it offers but very little obstruction to vision. Although military necessity does not now demand the adoption of the machine as a fighter, it lends itself admirably to the needs of civilian uses. The planes are readily detachable and are easily set up, as there are no wires to align. When the planes are removed, they can be strapped alongside of the fuselage and the machine then takes up only about one-fifth of the room ordinarily required for storage. The machine can be rigged up ready for flight in 15 minutes.



All the controls are exceptionally easy in their operation. The tail is flexible, and its efficiency is illustrated by the fact that a 1 inch deflection causes a controlling moment equal to that produced by a rigid flap movement of 4 inches.

The two main tail beams are 1½ inches by 1¾ inches laminated spruce. A horizontal V section spruce leading edge is used. The battens are air-seasoned white ash.

Ackerman spring wheels are used, which cut down resistance and do away with the usual rubber shock absorber cord.

The principle of radiation is original. Besides the nose radiator of the "Livingston" type, copper mesh screens cover in the sides and top of the fueslage, forward of the wings, and this surface has proven adequate for the Liberty "6." Much of the radiation is thereby effected by skin friction rather than by dead head resistance.

The propeller was designed by Mr. Caldwell at McCook Field, Dayton, Ohio. It has a 10′ 6″ pitch and is 7′ 0″ in diameter, designed for a speed of 195 miles an hour, which the machine is expected to make with full power.

ION, Garden City, L. I.

THE HUGHES AIRCRAFT REPORT

(Concluded from last week)

General Conclusions and Recommendations

1. The controlling facts and the conclusions in relation to the matters reviewed have been stated under appropriate headings. It would be impossible to re-state them in a brief summary. The defective organization of the work of aircraft production and the serious lack of competent direction of that work by the responsible officers of the Signal Corps, by which the delays and waste were chiefly due, were matters for administrative correction through unification of effort under competent control. The provisions of the criminal statutes do not reach inefficiency.

It is not within the province of this report to make recommendations with respect to administrative policy, but it should be said that under the direction of Mr. Ryan and Mr. Potter there has been improvement in organization, and progress has been made in gratifying measure.

2. The evidence discloses conduct, which although of a reprehensible character can not be regarded as affording a sufficient basis for charges under existing statutes, but there are certain acts shown, not only highly improper in themselves but of especial significance, which should lead to disciplinary measures. The evidence with respect to Colonel Edward A. Deeds should be presented to the Secretary of War to the end that Colonel Deeds may be tried by court martial under articles 95 and 96 of the Articles of War for his conduct (1) in acting as confidential adviser of his former business associate, H. E. Talbott, of the Dayton Wright Aeroplane Company, and in conveying information to Mr. Talbott in an improper manner, with respect to the transaction of business between that company and the division of the Signal Corps of which Colonel Deeds was the head; and (2) in giving to the representatives of the Committee on Public Information a false and misleading statement with respect to the progress of aircraft production for the purpose of publication with the authority of the Secretary of War.

3. The absence of proper appreciation of the obvious impropriety of transactions by Government officers and agents with firms or corporations in which they are interested compels the conclusion that public policy demands that the statutory provisions bearing upon this conduct should be strictly enforced. It is therefore recommended that the officers found to have had transactions on behalf of the Government with corporations in the pecuniary profits of which they had an interest should be prosecuted under section 41 of the Criminal Code.

4. The Federal Trade Commission should be requested to report upon the proper cost of mahogany for aeroplane propellers, to the end that upon the coming in of its report the question of the propriety of further action with respect to the transactions of the Mahogany Manufacurers and Importers Association may be determined.

5. It is recommended that the representatives of the Department of Justice should keep in touch with the progress of the re-audit of accounts so that it may be advised of the complete enforcement of the rights of the Government in final settlement of accounts, and that the Government has been fully protected against unnecessary loss through waste and the absence of suitable factory supervision.

6. Permit me also to suggest that a special division, or subdivision of the present Bureau of Investigation, in the Department of Justice should be assigned to the consideration of suggested delinquencies in connection with aircraft production so that the work already done may be appropriately followed up. In particular, it is recommended that the activities in relation to Spruce Production, which being largely centered on the Pacific Coast it was impracticable to embrace in the present inquiry, should be carefully scrutinized.

I have the honor to remain,

Respectfully yours,
(Signed) CHARLES E. HUGHES.

Comment of the Attorney General

THE PRESIDENT, October 31, 1918.
The White House.

Dear Mr. President:

On May 6th last you directed me to investigate and pursue charges of dishonesty or malversation in regard to the production of aircraft and, on May 13th, you asked Judge Charles E. Hughes to act with me in making this investigation. By far the larger part of the last five months has been consumed in taking testimony. An opportunity has been given to every person claiming to have grievances, charges, or criticisms to appear and testify in person and produce other witnesses and data.

We spent many weeks in personally inspecting conditions and taking testimony at the larger plants having aircraft contracts with the Government at Dayton, Ohio; Detroit, Michigan; Elizabeth and New Brunswick, New Jersey; and Buffalo, New York. The papers, books, correspondence, accounts and other records in the files of the Signal Corps at Washington, as well as those of the principal contractors and of the Government at these plants, have been critically examined as far as there was reason to believe that they would throw light on the matters under investigation. We have examined nearly three hundred witnesses and taken about 17,000 pages of testimony.

In an effort to make the investigation thorough, we have attempted to go into every phase of aircraft production since our entry into the war in April, 1917, and had recourse to every source of information which appeared available. Every complaint or charge of wrongdoing has been heard and carefully considered. It is believed that the investigation has been exhaustive, except that full data as to contracts let abroad for planes has not been at hand, and the matter of spruce production on the Pacific Coast has been gone into only to the extent that this could be done by the examination of witnesses at Washington. From the investigation made, it has been concluded that the taking of the additional time necessary for obtaining complete data from Europe in regard to the contracts in question, or for a trip of investigation to the Pacific Coast where most of the spruce is produced, was not justified. During the period referred to Judge Hughes has given practically his entire time to this work and has been in direct charge of the investigation, which has been conducted by him with the cooperation of myself and other officials of the Department of Justice. The investigation has now been completed.

Some three weeks ago, at the conclusion of the taking of testimony, in order that you might have the independent judgment of both, Judge Hughes and I, each without conference with the other, considered the evidence, reached his own conclusion and prepared a report. On the afternoon of last Saturday, October 26th, Judge Hughes handed to me a copy of his report, together with a letter asking me to transmit it to you with whatever statement of views I wished to make. The report consists of 182 printed pages. By far the greater portion is devoted to a remarkably accurate statement of substantially all the transactions had since the beginning of the war in the course of the development of the aircraft program. After carefully examining this statement of the transactions had, I find myself in substantial accord therewith and do not consider it necessary to present to you a somewhat full report which has heretofore been prepared in the Department of Justice. As hereinafter shown, I also find myself in accord with the conclusions presented by Judge Hughes on questions of dishonesty and malversation.

I do not consider it germane to this investigation to enter into criticisms of the program or of mistakes in policy or in the exercise of judgment.

I send you herewith Judge Hughes' report and present herein my conclusions and briefly supplement Judge Hughes' findings of fact in a few instances.

General Character of Charges

When the investigation began, in May, it was sweepingly charged that $691,851,866.47, appropriated for the fiscal year beginning July 1, 1917, had been expended with practically no results; that members of the aircraft boards had been financially interested in aircraft contracts; that German and disloyal influences had retarded the progress of the work and that these influences, together with graft of various kinds, had entered into the transactions involved. It therefore seems desirable to state briefly what sums have been expended and what has been accomplished.

Amount Expended.

The $691,851,866.47 appropriated was for all aviation purposes, including many things besides the building of aircraft. Contracts for aeroplanes and motors let here and abroad, it was estimated, would require $474,910,706.55, but in May last this amount had by no means been expended. The actual disbursements for this purpose up to the close of the fiscal year ending June 30, 1918, were as follows:

For production in this country	$106,741,490.77
For production abroad	25,605,074.31
For experimental and development work	1,697,830.19
Total	$134,044,395.27

This amount includes not only the cost of planes and motors delivered, but also large payments for special tools and for labor and materials in planes and motors not then finished. The figures are not now available to show just how much more has been disbursed on this account since June 30th, though the total amount disbursed for all aviation purposes between that date and September 30th was $139,186,661.33.

Planes and Motors Acquired

To provide for the needs of the Army until production in this country could be expected, contracts were let, in the summer of 1917, in France for 875 training planes with engines and for 5,000 service planes and 8,500 service engines, deliveries to begin in November and be completed in June, 1918, and in Italy for 700 service planes with engines. These contracts were not carried out as contemplated, partly because of unavoidable delay by this Government in delivering materials, but largely because the unexpected increase in the needs of the French Government overtaxed the capacity of the manufacturers. However, up to July 31, 1918, there had been acquired under foreign contracts 1,617 training and 1,512 service, or a total of 3,129, planes with engines. The deliveries of planes and engines produced in this country up to July 1, 1918, were:

Planes.		
Elementary training	4,572	
Advanced training	1,046	
Service	533	
		6,171
Engines.		
Elementary training	7,662	
Advanced training	2,579	
Service	2,392	
		12,633

Since July 1st production has been such that up to October 11, 1918, the figures were:

Planes.		
Elementary training	5,187	
Advanced training	2,137	
Service	2,350	
		9,674
Engines.		
Elementary training	10,256	
Advanced training	4,479	
Service	9,937	
		24,672

When the 3,129 acquired abroad are added, we have total planes 12,803, and 27,801 engines. While the only service planes thus far produced in this country have been observation and bombing planes, those acquired abroad include pursuit and combat planes.

Conduct of Members of Aircraft Boards

The results, as above set out, in view of the inherent difficulties of hurriedly expanding the Signal Corps from almost nothing to an immense organization, selecting, upon more or less conflicting information from abroad, the proper types of planes and engines, securing responsible and efficient contractors to engage in a new line of work, the designing and making of enormous quantities of machinery and tools, and the development of an industry almost unknown in this country and undergoing constant changes abroad, cannot be said to indicate dishonesty or malversation.

An exhaustive examination into the entire conduct of aircraft matters fails to show that any member of either board has had any desire to retard or delay production, or has done anything intended to accomplish that result, or has intentionally caused the waste of funds, or been actuated by a disloyal motive, or been guilty of dishonesty or malversation, unless there be truth in the specific charges which will now be referred to.

A. Interest in Contracts.

I agree with the conclusion reached by Judge Hughes that there is no evidence upon which it can fairly be charged that any member of the aircraft boards, including Mr. Howard E. Coffin, General Squier, Colonel E. A. Deeds, Colonel R. L. Montgomery, Colonel S. D. Waldon, Mr. Richard F. Howe, Mr. Harry B. Thayer, Admiral Taylor, and other

naval officers, has been unlawfully interested in any contract or transaction relating to aircraft production. Indeed, as to this charge, there has, at no time, been ground for a question involving any of these gentlemen except Colonel Deeds.

B. Form of Contracts.

Growing largely out of the popular understanding that contracts for aircraft provide that the compensation of the contractor shall be a fixed per cent. of the cost of production, and thus make it to the interest of the contractor to increase that cost, the charge has been made that these contracts are themselves instruments for practicing frauds upon the Treasury.

The fact is that no such contracts have been made. The Government is to pay the cost of production plus a fixed sum, which cannot be enhanced by increasing the cost of production. On the contrary, it is provided that the contractor shall share in the saving if the actual cost shall be less than an "estimated cost" stated in the contract. Hence, whatever other objections there may be to the contract, it is to the interest of the contractor to keep the cost of production as low as possible. Moreover, the right is reserved to the Government to terminate the contract at any time by repaying the amount expended plus the fixed profit on finished articles and 10% of the cost of labor and materials in unfinished articles. If, therefore, experience should demonstrate that the contract would be unfair, the Government could terminate it unless the contractor would agree to a readjustment of terms.

In the case of the Liberty motor contracts, the practical result has been first a reduction of the estimated cost from $6,087 to $5,000 and of the fixed profit from $913 to $625, and finally the putting of the contracts on a fixed-price basis when experience had shown what would be a fair price.

In view of the fact that when this form of contract was adopted there was no available data as to what the cost ought to be, it seems to have been devised to protect the interest of the Government. I am unable to see how an inference of bad faith or official dereliction can be drawn from it.

C. Awarding of Contracts.

There have been charges of unfair discrimination and favoritism in the awarding of contracts. These complaints relate almost entirely to contracts for planes for which there were many applicants. Selections had to be made. It cannot be said that plausible reasons were wanting for those made. If mistakes were made nothing has been developed which would justify the charge that they resulted from corrupt motives.

D. Profits of Contractors.

It has been charged that exorbitant profits to contractors have been allowed. On their face, they appear to be unusually liberal, but when it is remembered that 60% or more of them must be paid to the Government as income and excess profits taxes, and that most of the net profits will be invested in buildings and facilities which may or may not be capable of profitable use for an indefinite period after the termination of the contract, my conclusion is that no such profits have been allowed as to justify a charge of bad faith.

E. Cross-License Agreement.

Whatever may be said of the charge that this arrangement tends to discourage future inventions, one of its results was to enable the Government, through contractors, to secure the use of all necessary patents at a fixed cost and with little friction. It was not entered into until the Attorney General had given an opinion that it did not conflict with the anti-trust law. I find no basis for the suggestion that in bringing it about the members of the aircraft board were actuated by any unlawful or dishonest motive.

F. Conduct of Colonel E. A. Deeds.

Of all the members of the aircraft boards, the one most severely criticized and against whom most charges have been brought has been Colonel E. A. Deeds. The evidence does not disclose any violation by Colonel Deeds of the criminal laws. In the early part of 1918 public statements were issued with official authority purporting to set out the progress which had then been made in the production of engines and planes and the prospects of immediate future. These publications were not only misleading, but they contained false statements, and were issued in reliance upon information principally furnished by Colonel Deeds, who was acquainted with the actual facts. While the conduct of Colonel Deeds in this matter was not criminal and cannot be said to have affected actual production, it was inexcusable and reprehensible.

I also find that Colonel Deeds was guilty of censurable conduct in acting as confidential adviser of H. E. Talbott and in conveying information to the latter with respect to transaction of business between the Dayton Wright Aeroplane Company and the division of the Signal Corps of which Colonel Deeds was the head.

Whether or not Colonel Deeds should be subjected to disciplinary measures for the acts referred to is a matter to be determined by the War Department. I acquiesce in the recommendation of Judge Hughes that the facts be submitted to the Secretary of War.

Officers and Employees of the Signal Corps

When war was declared and the carrying out of the aircraft program was entrusted to the Signal Corps, its official personnel was hurriedly increased from a small organization to one of enormous proportions. It has been impossible, of course, to critically examine the conduct of all the military officers and civilians connected with this branch of the service. The official acts of the more prominent ones have been gone into and the general situation has received as much consideration as was possible. The investigation has failed to show, unless the instances hereinafter noted constitute exceptions, that any person, military or civilian, connected with the Signal Corps has desired to retard or delay production, or has done anything intended to accomplish that result, or has intentionally caused waste of funds, or has been actuated by disloyal motives, or been guilty of dishonesty or malversation. The incidents referred to are as follows:

A. Conduct of Lieutenant-Colonel J. G. Vincent, Lieutenant-Colonel George W. Mixter, and Second Lieutenant Samuel B. Vrooman, Jr.

Many successful business men tendered their services to, or were invited to take part in the activities of, the Signal Corps. Naturally the men selected were chosen as far as was practicable from lines of business similar to those in which the Government expected to utilize their services. With the business interests of the country so largely involved in war work, many of these men, in the course of the performance of their official duties, not infrequently were brought in contact with corporations in which they held stock. It is to their credit that only three instances have been found in which officers or employees of the Signal Corps have apparently transacted business for the Government with corporations in which they were interested.

One of these was Lieutenant-Colonel Vincent, who had been Vice-President of the Packard Motor Car Company, in charge of engineering, and who, after he became an officer in the Signal Corps, continued to hold certain shares of stock in that company. He was one of the original designers of the Liberty motor, held several important positions in the engineering department, and is now in charge of the Aeroplane Engineering Division of the Bureau of Aircraft Production. Under the circumstances set out in Judge Hughes' report, Lieutenant-Colonel Vincent was instrumental in having certain payments made to the Packard Motor Car Company for drawings, models, tests, etc., and for eleven standardization engines. The course of procedure which resulted in the payments of this money was without a written contract and otherwise irregular and unusual. I agree with Judge Hughes' conclusion that Lieutenant-Colonel Vincent violated Section 41 of the Criminal Code, which prohibits any person, directly or indirectly interested in the pecuniary profits or contracts of a corporation, from acting as an officer or agent of the United States for the transaction of business with such corporation. I further agree with Judge Hughes that the evidence does not afford ground for the conclusion that the Government was defrauded, or that there was any intent to defraud on the part of any of the parties concerned, or that the services rendered were not worth the amount paid therefor, or that the estimates of the outlay of the Packard Company were not fair estimates.

Lieutenant-Colonel George W. Mixter held twenty-five shares (par value $2,500.00) of the preferred stock of the Curtiss Aeroplane and Motor Corporation. This corporation had important contracts with the Government for the production of aeroplanes. While holding this stock, Lieutenant-Colonel Mixter was in charge of the organization for the inspection of materials and products at one of the corporation's plants, and visited it from time to time in the exercise of his authority as head of the Inspection Department and as Production Manager. He stated on examination that he had bought a small amount of common and preferred stock of the corporation mentioned some years before and remembered selling some of it, that he did not remember whether he retained any and had not thought of it after entering the service. It appears that he had parted with ownership of the common stock, but still owned the preferred. I agree with the conclusion of Judge Hughes that this was a violation of Section of 41 of the Criminal Code.

Second Lieutenant Samuel B. Vrooman, Jr., was the owner of $10,000.00 in par value of the stock of the S. B. Vrooman Company, of Philadelphia, which had a contract with the Government for supplying mahogany. While holding this stock, Lieutenant Vrooman was put in charge of the inspection of propeller lumber, including mahogany. He selected the district officers, who in turn selected the inspectors; he issued instructions to the district officers and visited various plants to see that the inspectors were doing their duty and to pass on disputed points. The plant of the S. B. Vrooman Company was one of those subject to his jurisdiction, but he denies that he ever personally inspected its lumber. I agree with Judge Hughes' conclusion that he violated Section 41 of the Criminal Code.

B. Conduct of Mahogany Manufacturers and Importers Association.

For a short period of time J. C. Wickliffe, J. Edward McCullough and Second Lieutenant Samuel B. Vrooman, Jr., while representing the Government in dealing with mahogany manufacturers, received from one or more of these manufacturers salaries in addition to those paid by the Government. I agree with Judge Hughes that under the circumstances this was a gross impropriety on the part of those paying and those receiving the additional salaries, but that there is no statute making it a criminal offense unless a case is made out of bribery or of a conspiracy to defraud the Government. I am likewise of the view expressed by Judge Hughes that whether a charge of the sort indicated could be properly made would largely depend upon whether the terms and prices of the mahogany manufacturers were fair and reasonable, or excessive and the result of improper influence, and that the Federal Trade Commission, with its special facilities for conducting an examination of that kind, should be requested to make a survey of the mahogany industry and the cost of delivering the lumber involved and reach a conclusion as to the reasonableness of the prices paid.

C. Matters of Minor Importance.

In one office of the Signal Corps there seems to have been discovered petty graft fostered by a civilian employee, and evidence has been brought to our attention tending to establish dishonest inspection on a rather small scale in one of the least important plants. These matters are now under investigation by grand juries and indictments will be found if justified.

Contractors

A searching inquiry has been made into the conduct of the work by the principal contracting companies. Agreeing substantially, as I do, with the statement of facts made by Judge Hughes, I am of opinion that it cannot fairly be charged that a managing officer of any contracting corporation has desired or attempted to delay production or been actuated by disloyal motives. To what extent, if any, inefficiency or mismanagement is to be inferred from the facts stated, I do not deem it within my province to determine.

German Sympathizers

In some of the factories a considerable number of alien enemies and persons of German birth or descent, who, at least before our entry into the war, were German sympathizers, have been employed. No facts have been developed which would justify the belief that these men have been retained through any willingness on the part of their employers to have production retarded or defective planes produced. On the contrary, the Government itself provided a system of permits under which they could be used. They were employed and retained because the manufacturer felt that the great difficulty of obtaining skilled laborers in sufficient numbers justified such risk as might be incurred. In some instances the employer had faith in an old employee and was unwilling to discharge him because of mere rumors as to his loyalty. As an illustration of this, the head of the drafting department at the Ford Company's plant was of German birth and there were such persistent rumors that he was pro-German that some of the officers of the company thought it unsafe to retain him. He had been in the employ of the company for nine years, professed to be loyally interested in the work, and the officers referred to testified that nothing definite could be proved against him. Mr. Ford stated that, at a time when all citizens were called to make sacrifices, one of German birth might do so by helping to produce motors to be used for his adopted and against his native country. He stated further that he had absolute confidence in this man's loyalty and, in the absence of any proof of disloyalty, refused to discharge him. While this indicated the application of an almost idealistic policy of being just to employees, results seem to have justified the course pursued. Though this man has been the object of the greatest watchfulness on the part of officers of the company who suspected him, nothing has been discovered indicating that he has been other than a loyal and efficient employee. It is fair to say that no

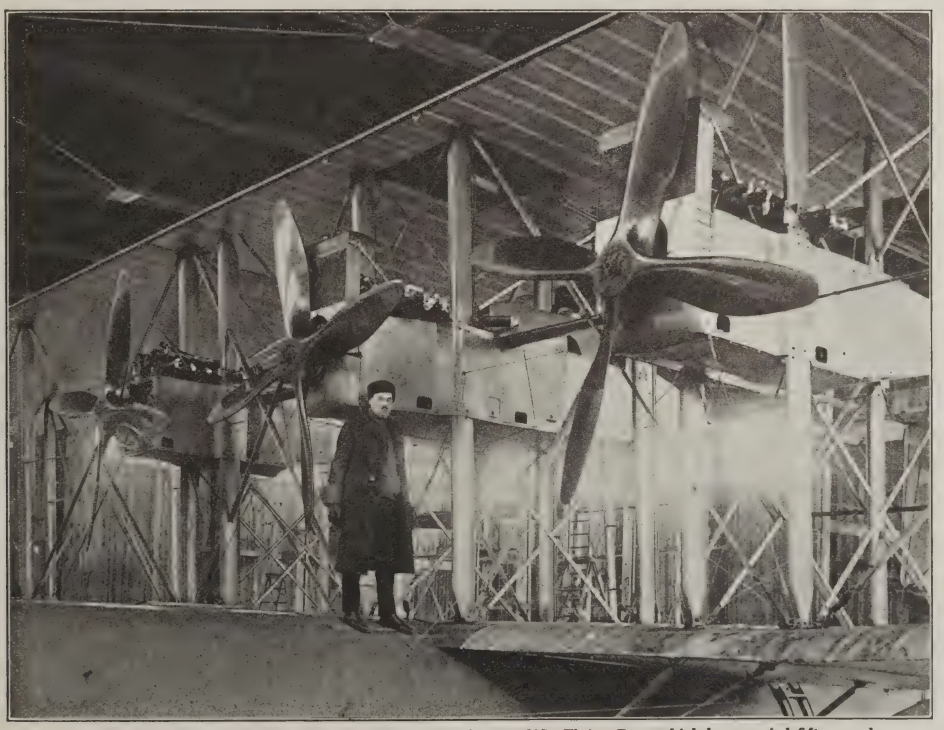
Experience of a Balloonist

First Lieutenant W. J. B. Taylor, Observer, Balloon Corps, First Army, residence Rochester, N. Y., has reported to the Division of Military Aeronautics headquarters for overseas for discharge. Taylor wears the distinguished service cross awarded him in action on September 26 and October 10 for declining to discontinue making observations for the Division Commander when his balloon was attacked by enemy aeroplanes and refusing to abandon his records, although he could have safely jumped in his parachute.

Lieutenant Taylor is one of five room-mates, at Harvard in 1917, who enlisted, three of whom have been decorated and two killed in action. The other four were: Captain Douglas Campbell, aviator; Lieutenant L. A. Morgan, 328th Field Artillery; Lieutenant K. P. Culbert, aerial observer, Marine Corps, East Orange, awarded croix de guerre after death; Lieutenant A. K. Dunn, 76th Division, Charleston, Illinois, killed in action.

From the records it appears Taylor had several unusual experiences in parachute jumping under fire. One time he landed in a tree; another time on an army mule. This last adventure took place about the first of October near Montfaucon when the Infantry were assaulting Romagne. Taylor had been up about two hours watching the Boche Infantry digging in and fortifying machine gun nests in front of the U. S. Infantry attack. Suddenly in the midst of this observation his balloon was attacked by a single seater combat plane. The Hun pilot was so near him that he could easily distinguish the man's features. But on account of the close range and the very hot fire, Taylor did not hesitate to jump immediately. The German pilot missed the balloon in his first onslaught and turned to follow it down, as the crew below hauled it to earth. Despite the machine gun fire of the balloon company against him, the Hun came as low as 200 feet. His engine was finally so badly hit that he lost control and fell. The motor was cracked up, but the plane was undamaged, and as the Hun landed he vigorously cursed the Americans, one and all, whereupon a buck private punched him in the face. In the meantime Taylor's parachute had carried him well beyond this exciting scene into a peaceful pasture and a herd of army mules, on one of which he landed and was rescued from the bucking, kicking animal by some artillerymen who came by just in time. Taylor said he was more concerned over his seat on the army mule than he was about his safety in making the parachute jump.



March Field Turns Out 185 Aviators

March Field has trained and graduated 185 Reserve Military Aviators. Of this number 180 were cadets, graduates of ground schools sent here for flying instruction. The remaining five were commissioned officers of this Post who qualified for flying instruction and made good.

Flying was started at March Field on June 15, 1918, and, since that time, up to and including December 14, a period of seven months, there has been a total of 35,468 flying hours. During this time, it is estimated that a total of 2,482,760 miles have been flown. The most remarkable feature of this record is that not a single casualty has occurred, despite the prevailing idea that flying is dangerous, especially in the instruction stage.

Most of the cadets graduated from this flying school have been transferred to advanced flying schools, where, reports indicate, they have more than held their own with men graduated from other fields, thus evidencing the thoroughness of their elementary training.

Under the after-the-war organization or rather re-organization of the field the flying department is to be run on a different basis. Under the new system there will be four flight squadrons, each consisting of four hangars.

FOREIGN NEWS

New Altitude Record 30,500 Feet

London, January 3—Flying a British aeroplane at Ipswich yesterday Capt. Lang established a new altitude record, reaching 30,500 feet. Observer Blowers, who accompanied Capt. Lang, collapsed when his oxygen bottle broke, but recovered. Both were frostbitten.

Dayton, Ohio.—Capt R. W. Schroeder, an American pilot, of the Wilbur Wright Aviation field, held the altitude record just broken by Capt. Lang. He reached 28,900 feet on September 18, 1918, coming down near Canton, Ohio.

Record Climber Arrested

London.—Capt. Lang, the aviator who on January 2 established a new aeroplane altitude record of 30,500 feet, has been placed under arrest by the British army authorities, according to the *Evening News*. Capt. Lang was arrested, it is stated, because of his disclosing without authorization the details of his climb.

How Britain Developed Her Air Fighting Force

London.—The declaration of war by Great Britain at midnight, August 5, 1914, found the Royal Flying Corps with only four squadrons in being —representing well under 100 aeroplanes. Three of these squadrons went instantly to France. A new squadron followed these pioneers in about ten days' time, while the fifth squadron, mobilized and sent out in twenty-four hours, reached the fighting zone about the middle of September.

In those early days of the war machines were used simply for strategical reconnaissance. It was not until after the battle of the Aisne, when settled line warfare was established, that artillery fire control from the air and the crude forms of cooperation with the infantry were practised and developed.

As late as June, 1915, ordinary rifles with shortened barrels were carried by British pilots, and hand grenades were flung at enemy aviators in the air. The development of formation fighting and the evolution of aerial gunnery dates from about this time when the machine gun became an essential part of the equipment of fighting pilots and observers.

Zeppelin Crews Must Fly Craft to Surrender

London, January 5.—The *Echo de Paris* says a wireless despatch from Nauen, Germany, announces that a committee of three Allied officers has arrived in Berlin from Spa to superintend the carrying out of the conditions of the armistice relative to German airships at Friedrichshafen and Interborg.

The British and French experts, the newspaper adds, are agreed concerning the compelling of ordinary Zeppelin crews to bring the airships either to England or France after the aircraft have been examined and passed upon by competent authorities at special hangars which have been appointed to receive them. The procedure in the turning over of the airships will be the same as that followed in the surrender of German warships and submarines.

British Aerial Transport Chief Is Chosen

London, January 5.—Maj.-Gen. Sir W. Brancker, who recently visited America on a British mission, is taking an important post in connection with the Aircraft Manufacturing Company, of which Holt Thomas is managing director.

Announcement has been made already that this company is arranging an aerial passenger service between London and Paris. Plans will be developed in many other directions, including airlines from London to Glasgow, Edinburgh, Manchester, Newcastle, Wales and Ireland; also external lines from London to Sweden, Denmark, Holland, Spain and Italy.

Brancker will direct this scheme of aerial transport and also the higher aspects of international flying, the creation and development of an organization of pilots and aeroplanes. He will plan also the air routes over land, with landing grounds every ten miles, including a route from England to India, and at sea will look after the placing of a series of mark boats at intervals of 200 miles.

An American-British transatlantic air commerce line is one of the ultimate features which he will control, while still retaining the rank of Major-General in the Royal Air Service. Obtaining his services is regarded as a great triumph for the company.

The British Armstrong Whitworth Quadruplane with a 130 h.p. Clerget engine. It is a two seater, general utility machine and makes a speed of 84 m.p.h. at ground level

Carbide is New Fuel for Aero Motors

London.—The Goteborgs Handels-Tidning reports that experiments are being conducted at Messrs. Nielson and Winther's aeroplane factory, Copenhagen, with a motor fuel made from carbide. A Danish engineer, Herr Carsen, of the Danish State Railways, originated the idea and the experiments will probably be concluded in about 14 days.

If the results correspond to expectations, a factory will be erected at Amager for the production of aeroplane carbide.

The costs of production are at present high.

Bomb Captured Airdrome

Berlin.—It is reported that Polish forces have recaptured the village of Nakel, northeast of Posen, and that the City of Bromberg, just to the east of Nakel, is threatened. German troops have recaptured the village of Kolmar, further west.

German aviators from Frankfort-on-the-Oder have bombed a flying station near Posen which was captured by the Poles on Sunday. The Polish authorities have issued a warning that they will not be responsible for the lives of German citizens if the attack is repeated.

Cairo-to-Cape Air Schedule Planned

London.—Long-cherished plans for a transportation route from Cairo to the Cape seem likely to become effective by means of a regular commercial air service, according to Major Gen. Sir F. H. Sykes, Chief of Air Staff, in an address on January 7 on "Commercial Aviation in the Light of War Experience."

He said the Royal Air Force hopes to open an "all-red" route the length of Africa. In his talk he told of the achievement of a Zeppelin which remained four days in the air without landing, after carrying twelve tons of ammunition from Bulgaria to the relief of the besieged force in German East Africa; and which, on receiving word by wireless that the German force had surrendered, returned to the starting point in safety.

It is believed among air authorities here that Germany, in view of Zeppelin experiences in the war, will develop that means of transportation, especially in future trade with Russia. In the course of the war Zeppelin construction became expert and the men who can make the best machines are still available to build for peace trade. It is expected that an express service will be started to Moscow and Petrograd as soon as peace conditions arrive.

"It may be well," Gen. Sykes said in his address "that the airship will be utilized for long distance service, involving non-stop flights. There is practically no limit to the range of such service.

"One drawback to airship construction has been the great expense of constructing sheds large enough to house rigid ship. Possibly this difficulty may be surmounted by a method of mooring ships to masts or cables. In that case airships would need to be taken into sheds only for overhauling and repairs."

It is intended as previously reported, to use aeroplanes for carrying despatches to and from Paris at the time of the Peace Conference, and the suggestion is now heard that members of the British peace delegation may be conveyed to Paris and back at that time by the same service.

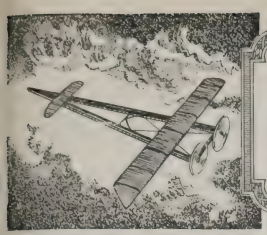
Feats of Flying Revealed

Some of the wonders achieved in aerial navigation and other wonders contemplated were spoken of by Major General Sir F. H. Sykes, who told how Paul D. Cravath and Oscar T. Crosby, American members of the Inter-Allied Council, had been carried from England to Paris and back on the same day in four hours and twenty minutes.

In four months, between July and October, 207 trips were made across the English Channel. The mileage traversed was 8,085 and 1,843 passengers were carried, although flying was possible only on seventy-one days.

The fatal accidents were surprisingly few, the average being only one fatality in every 1,170 hours flown. Since January, 1916, 340 officers had lost their lives on the western front, nearly all their deaths being due to battle. The total hours flown was close to a million.

The difficulties of a transatlantic flight, according to General Sykes, were not so much endurance of the machine and personnel, but of navigation, meteorology and wireless, and such a task should not be undertaken lightly.



Night flying, according to General Sykes, is less liable to suspension than day flying, owing to weather conditions being more suitable. For instance, he said, it might be possible to make 130 night and only 100 day trips from London to the Rhine in a year.

The direction-finding wireless apparatus carried by aeroplanes was developed during the war, General Sykes said. This apparatus enabled machines to flying in all kinds of weather. The details of it remained a secret.

British Peace Delegates to Commute by Aeroplane

Paris.—One of the strange things this peace conference may see, unprecedented in history, is the delegates, even the British Cabinet Ministers, commuting by aeroplane between London and Paris. When the entire British delegation arrives it will get down to business at once, but until the negotiations reach their most absorbing stage they will go back and forth between the two capitals, attending to the international business during the week and going home to supervise national affairs at the week ends.

This can be done because the Paris-London journey now requires only ten and a half hours by train and boat, but it is much quicker by aeroplane. As soon as the weather improves the trip can be made rapidly and easily. It is fully expected that the British delegation will avail itself of this means of travel between the two cities.

ELEMENTARY AERONAUTICS and MODEL NOTES

By John F. McMahon

Model Aeroplane Building as a Step to Aeronautical Engineering

HAVING completed the construction of the wings we will now turn to the making of the tail surfaces, fin, and rudder. These are built in the same way as the wings were built up. The reader can see from the drawings just what is necessary and the general assembly of them. The builder must take as much care when building these parts as he did when building the wings, as the control of the machine is done by these parts. Another part that we haven't made as yet is the turtle deck or false work which goes over the top of the fuselage and gives the machine a good shape.

The turtle deck is made of 3/8 x 3/16″ strips of light wood laid over formers, four in number, and set at equal distances from one another. These formers are a part of a circle and are made from 3/16″ thick 3-ply veneer. The first and last being solid, while the two inner ones are lightened out to save weight. The strips that are laid over the formers are laid on edge and are set in grooves made for this purpose, after which they are nailed and glued in place.

The tail is made up of ribs and spars as shown in the drawing. The ribs are made like the main ribs, only they have a curve top and bottom. A spar runs through from tip to tip at the rear edge to which the tail flaps are fastened.

The tail flaps are made separately, the webs being solid instead of hollowed out.

The fin and rudder are made up like the tail.

When finished control arms are fastened to the tail flaps, rudder, etc. These arms are made of ¾″ O. D. steel tubing 14″ long. These pieces of tubing are flattened at each end and at the centers.

Then the whole tube is crushed to make it an almost streamline section as shown. (It is possible to get this tubing already made oval in shape.)

The arms are then fastened to the flaps, rudder, and ailerons with bolts fastened right through the beams and the holes in the spars (see drawings).

After fastening the hinges in place on ailerons, tail, and etc., the body, wings, etc., can be covered with unbleached muslin. The covering job is very tedious and whether it is good or bad depends on the builder.

When fastening on the body, bottom and sides should be one piece ending at the two top sides and fastened with small tacks. The turtle deck is then covered after which the ends are fastened along each top longeron with ½″ tape and small tacks. Of course it is understood that the fabric must be pulled tight when covering.

The wings, ailerons, etc., are next covered. When covering wings, attach at one end first and then stretch and fasten to the other end with tacks after which the fabric is fastened to each rib with ½″ white tape and small tacks (small copper tacks are best). The front edges are then fastened. Next fasten along the wire edge by pulling tight and after folding over the wire pining it fast, it is sewed. The other side is then covered and fastened in the same way.

When all fabric is fastened, the dope is applied and lightly sandpapered, after which another coat is applied. Then a thin coat of spar varnish is applied, to make the fabric proof against moisture.

(To be continued)

A Motorcycle Engine Driven Monoplane

THAT many readers of AERIAL AGE are interested in the construction and flying of light aeroplanes powered with small horse-power engines is proven by the great number of photographs and specifications that are being received lately.

One of the most interesting and simplest is the one shown in the accompanying pictures. This machine was built by E. G. Marble and F. D. Burke of Chicago.

At first glance and before examining the photos closely one would think they were looking at a "Breeze" Penguin.

The designers claim for this machine a speed of 35-50 M.P.H., but I have my doubts in regard to the maximum speed, as the engine is rated at 12 to 14 horse-power and when one considers that the slippage of an airscrew is at least 25% the actual horse-power is only 10.5 horse-power, which is very low. I do not doubt the machine can make about 45 M.P.H. under favorable conditions, but at best there is very little or practically no reserve horse-power. The writer will check the machine up and in a later article will present a correct set of figures covering this machine.

A small monoplane showing very good design and careful construction

The machine is very light, as the full loaded weight is 400 pounds and the loading is 3½ pounds per square foot. The total surface being 115 square feet. The reader must remember that a monoplane is figured as 100 per cent efficient, which is in contrast by the highest efficiency a biplane can attain, namely 87 per cent. Of course the general form of monoplane construction is not as strong as the biplane and for this reason some people do not care as much for them.

The span of the wing is 26 feet; chord 5 feet; wing section, U. S. A. 3; weight empty, 240 lbs. The fuselage is of semi-monocoque construction, being built of 3 ply veneer over a sub frame. The length is 14 feet and 24″ wide and 28″ deep. The propeller is 5 feet in diameter and has a 3-foot pitch, and turns over at 1,800 r.p.m.

Mr. Burke in his letter to me says that his object in building a machine of this kind is to develop a medium fast light machine that will be simple and inexpensive for amateurs to build. The general design of the machine appears to have been carefully worked out and the tail surfaces and rudder are very large, thereby insuring good control even at low speeds or while taxying along the ground.

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

"Yes," said the Mineola sparrow, "I've had a deuce of a time. Ran into one of these airman fellows, and broke the tip of my wing. Didn't remember anything till I woke up at Garden City, and I've had to walk home."

When the first aeroplane flew over Constantinople before the war, the inhabitants scuttled for safety from the sky-devil. Now that the Hun is a menace to the Turk, the sight of a British squadron brings Turkish delight.

"And so you are still only first-class air mechanic?"
"Yes, but I've got my boss in civil life beaten on points."
"What is he?"
"He's only a third-class able seaman in the Navy."

Mrs. Grundy: "Yes, but this must be the last answer to correspondents—we mean it this time. The aviator was not using words unbecoming to a gentleman in the presence of a lady. Pterygoid, Blimp and Helicopter are not swear words, but useful terms used by all airmen. It was the last one that copped you, or rather misled you, wasn't it?"

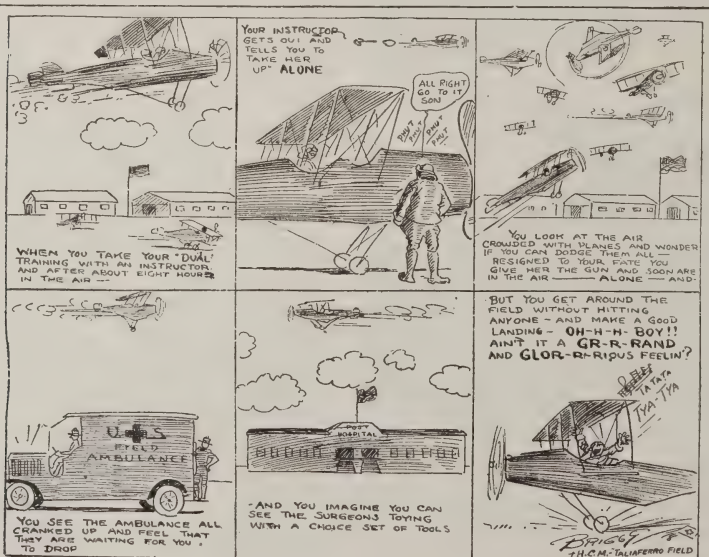
He Did!

Said Willie the War Lord to Willie the Clown,
"I'm afraid on Berlin the bombs will come down
To Willie the Kaiser said Willie the pup,
"I didn't suppose the darned things would go up."

To Willie the Clown Prince spoke Willie the Hun,
"When they get to Berlin, you won't see the fun."
To Willie the Wastrel said Willie the weed,
"When they get to Berlin, like my chin, I'll recede."

Wireless Phones on Planes

"Hullo, Central, put me on to Sopwith Camel, 1,428, Extension 9. Hullo, are you there? That Lieut. Smith speaking?"
"Hullo, yes, but ring off, will you; I'm looping just now."
"Hullo, hullo. Don't go away. That you, Jim?"
"Yes, but who's speaking?"
"Oh, it's only me, Jim. I say, are you very busy? I only wanted to ask where you left the nail scissors this morning."
Operator (breaking in): "Sopwith 1,428. If you've got those scissors you'd better cut off the connection. Bad language is not permitted on the aerial lines."



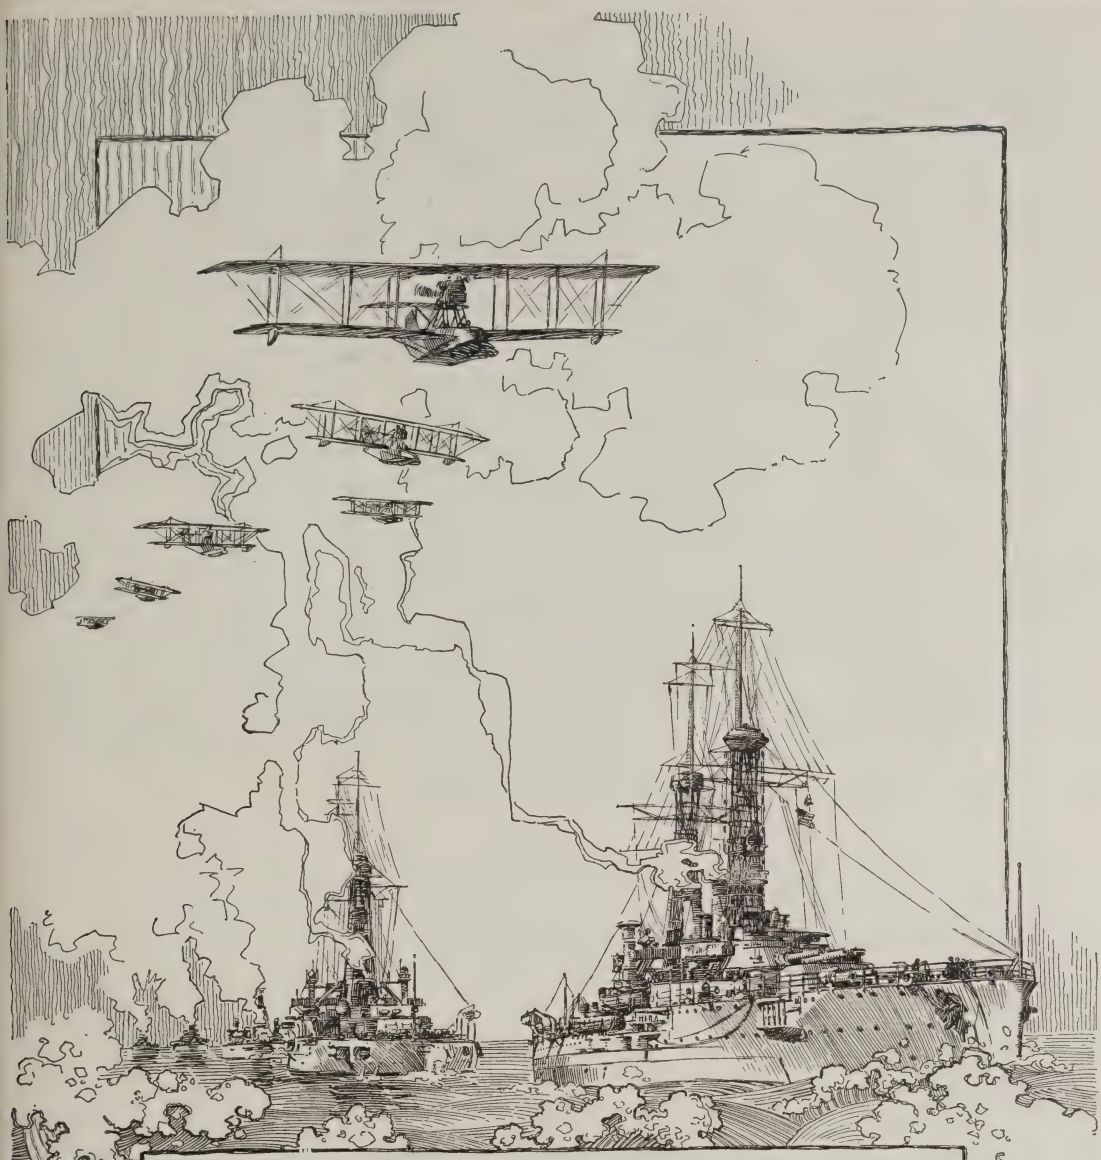
Too Quick

"Do you know," said Smith, "that before the parachute opened, I thought of every girl I'd made love to since I left school, and wondered if she'd think of me if the darned thing proved a dud."
"I didn't think they sent up sausage balloons such a height," replied Jenkins. "What a drop you must have had, old thing."

On the Farm

Young Hayseed chanced to be flying over the farm so he decided to descend and give the dad a surprise. Old man Hayseed was glad to see him, but didn't wave his arms about and get excited over the aeroplane. So Hayseed junior took him for a flip, did a loop, and rushed him home again somewhere about 90 per hour. But still the old man wasn't excited. "Speeds and loopin'," he said, "be great to you, maybe, but you should ha' seen me when the old bull tossed me onter his back and ran round the field so fast 'e wur runnin' 'is face whack into 'is tail."

Ain't It a Grand and Glorious Feelin'? . . . By BRIGGS

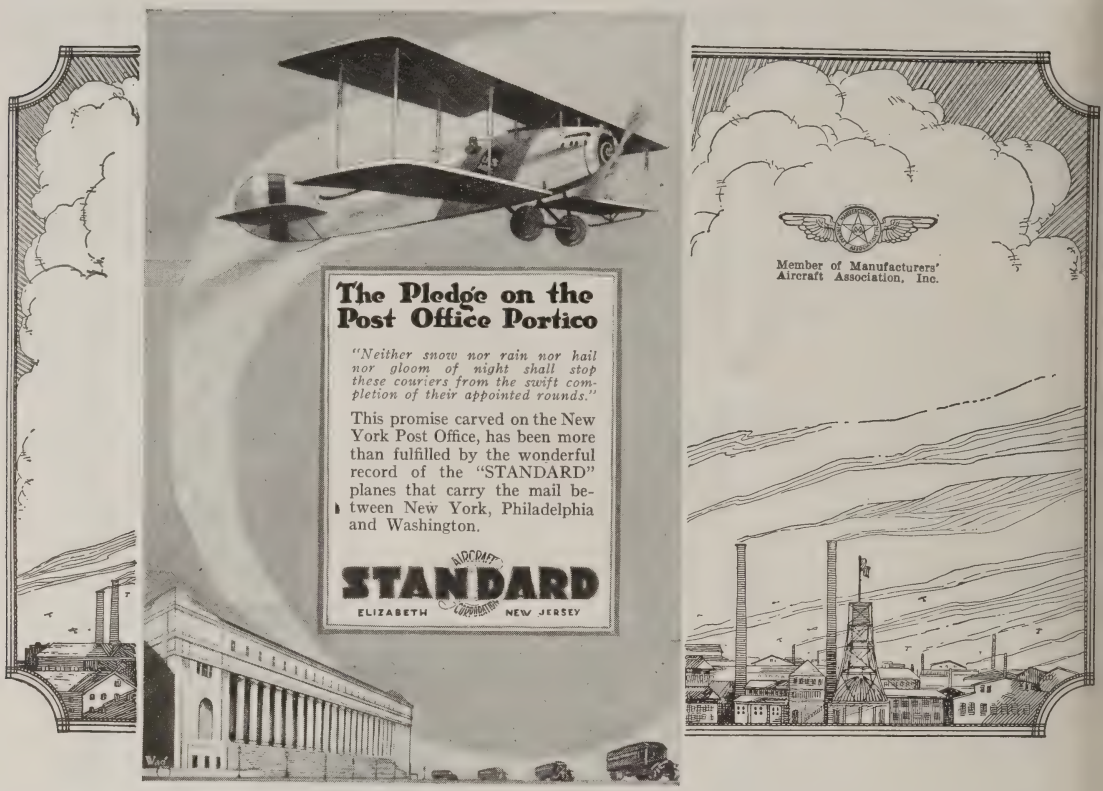


Additional Verses to "Locksley Hall"

(With apologies)

For I dipt into the future, looked
much farther yet ahead,
Saw my fellow creatures flying round
the world when I was dead.
Saw the City clerk in summer take
his seat without a fuss,
Through the air go winging swiftly in
the crowded Margate 'bus.
Saw Bill Sykes, when bent on burgling
other people's treasures rare,
Sneak from out his hangar, gaily, go
night-flying through the air.
P. C. Binns, the Bow Street bobby,
silent speed along the trail,
Drive him down until he got him
safely landed into gaol.
Saw the City merchant daily leave
his home to go to town,
Seated in a single seater, zooming up
and swooping down.
Saw the sportsmen get together, eager
youth and maiden fair,
Hopping over clouds and banking,
playing polo in the air.
Saw the lovers in the gloaming thinking 'planes a gracious boon,
All alone among the planets. What
a glorious honeymoon!
Saw the Income tax man chase me in
a speedy Sopwith pup,
Then my Camel started jibbing, so
thank goodness—I woke up.

—*Aubrey England.*



The efficiency of the Curtiss Flying Boats and the patriotic enthusiasm of Curtiss men who have made them, will stand as permanent expressions of true Americanism in the history of the Great War.

Curtiss Aeroplane & Motor Corporation, Buffalo, New York

V.Q. Martin

MANUFACTURERS AIRCRAFT ASSOCIATION INC.

Major Marr's Decoration Follows Him from Overseas

A letter received at the Division of Military Aeronautics recently from the overseas Air Service enclosed a Croix de Guerre awarded to Major Kenneth Marr, Commander of the 94th Squadron.

The citation which accompanied the medal stated that with the approval of the Commander General of the American Expeditionary Forces in France, the Marshall of France, Commander in chief of the French Armies of the East, cited in an order of the Army Corps as follows: "Captain Kenneth Marr, Commander of American Squadron 94th, excellent Squadron Commander of legondary bravery, has been a beautiful example to his entire unit. Previously cited."

Temporary Rank—Press Statement By the Secretary of War, January 6, 1919

"The problem presented by temporary rank of army officers is one which will of course have to be dealt with. The War Department has not yet undertaken to suggest what it thinks wisest about it. We have an anomalous situation; a very large number of men in the Regular Army have been promoted from lieutenants to captains, and captains to colonels, and so forth, and after a man has been doing duty with troops in war as a colonel it is pretty hard to revert back to a lower rank. The problem of how to stabilize rank is a serious one and one that cannot be solved until Congress decides what to do about the bill for the Army. If Congress provides for an army of a half million men (and all members I have talked with seem to be favorable), that would provide a much larger number of places for colonels, majors, captains, etc. So far as I know, it will take care of all the Regular Army men.

"An effort will be made to use all the present permanent officers and then fill in with those officers best qualified who are now in the temporary army and have signified their desire to stay in the military establishment."

Replying to a question regarding absent without leave cases in New York, the Secretary of War said:

"I was speaking to General Shanks yesterday in New York, and he told me that the situation there was somewhat difficult; that because of the relaxed pressure due to the termination of hostilities a great many of the younger officers felt that the bars were down and that they did not have to secure permits to be out, that many of them were absent without leave, and that there was a general relaxation in discipline. I told him I was quite sure that his own view was a wise one, and that demobilization must be an orderly demobilization, and that it is just as incumbent upon these officers to obey the military regulations during the period of demobilization as during the period of mobilization. We must insist upon the proper observance of duty by these officers."

Awarded Distinguished Service Cross

The commander in chief, in the name of the President, has awarded the distinguished service cross to the following named officers and soldiers for the acts of extraordinary heroism described after their names:

First Lieutenant James A. McDevitt, Air Service, United States Army. For repeated acts of extraordinary heroism in action near Ruisy, France, September 15 and October 5 and 6, 1918. On September 15, 1918, while performing an important mission Lieutenant McDevitt's balloon was attacked and riddled by an enemy plane firing incendiary bullets. He stuck to his post and gathered valuable information. On October 5 he was again attacked by several planes, and the basket was set afire by incendiary bullets. While descending he was fired upon and his parachute was hit many times; he, nevertheless, insisted upon returning to the air. On October 6 he was attacked and his balloon was riddled with bullets. Again, on the same day, he was attacked by several enemy planes; he remained with his balloon until it came down in flames; he then resumed his post in a new balloon. Home address, Mrs. James McDevitt, mother, 1114 Yale Avenue. Cincinnati, Ohio.

First Lieutenant Rodney M. Armstrong, Air Service, pilot, 168th Aero Squadronfi For extraordinary heroism in action November 4, 1918. As pilot of a D. H. 4 plane, Lieutenant Armstrong flew an infantry contact machine over the lines of the 7th Division November 4, 1918. Owing to low clouds and rain, he crossed the line at 1,000 feet in order to enable his observer to locate the position more accurately. While on the enemy's side he was wounded by an explosive bullet. In spite of his wound and weakness, he continued his mission, coming down to within 500 feet of the enemy's machine guns and troops, until his observer had signaled him that the mission was completed. Home address, Mrs. R. N. Armstrong, wife, 1012 East Eleventh Street, Winfield, Kans.

First Lieutenant James F. Manning, Jr., Air Service, pilot, 49th Aero Squadron. For extraordinary heroism in action near Doulcon, France, October 4, 1918. While leading a patrol of seven planes, Lieutenant Manning accepted combat with seventeen German machines (type Fokker) at an altitude of 1,200 meters. Through his courageous leadership and skillful maneuver of his petrol, seven of the enemy planes were shot down. Home address, J. F. Manning, father, Leesburg, Va.

First Lieutenant Field E. Kindley, Air Service. For extraordinary heroism in action near Bourlon Wood, France, September 24, 1918. Lieutenant Kindley attacked a formation of seven hostile planes (type Fokker) and sent one crashing to the ground. A bronze oak leaf is awarded to Lieutenant Kindley for the following act of extraordinary heroism in action near Marcoing, France, September 27, 1918. Flying at a low altitude, this officer bombed the railway at Marcoing and drove down an enemy balloon. He then attacked German troops at a low altitude and silenced a hostile machine gun, after which he shot down in flames an enemy plane (type Halberstadt) which had attacked him. Lieutenant Kindley has so far destroyed seven enemy aircraft and driven down three out of control. Home address, Utzer Kindley, cousin, care Bank of Gravette, Ark.

Second Lieutenant Kennth L. Porter, Air Service, 147th Aero Squadron. For extraordinary heroism in action near Chateau-Thierry, France, July 2, 1918. Lieutenant Porter, with four other pilots, attacked twelve enemy air craft (type Pfalz), flying in two groups well within the enemy lines. As soon as the enemy planes were sighted, Lieutenant Porter maneuvered to get between them and the sun and with great difficulty gained the advantage. While three of the other American officers dived on the lower formation,. Lieutenant Porter and Second Lieutenant John H. Stevens engaged the upper formation in a bold and brilliant combat, two planes of which they crashed to the earth. Home address, Mrs. Harriet Porter, mother, 105 Green Street, Dowagiac, Mich.

Second Lieutenant John H. Stevens, deceased, Air Service, 147th Aero Squadron. For extraordinary heroism in action near Chateau-Thierry, France, July 2, 1918. Lieutenant Stevens, with four other pilots, attacked twelve enemy aircraft (type Pfalz), flying in two groups well within the enemy lines. As soon as the enemy planes were sighted, Lieutenant Stevens maneuvered to get between them and the sun and with great difficulty gained the advantage. While three of the other American officers dived on the lower formation, Lieutenant Stevens and Second Lieutenant Kenneth L. Porter engaged the upper formation in a bold and brilliant combat, two planes of which they crashed to the earth. Home address, Mrs. Effie Stevens, 21 State Street, Albion, N. Y.

Cited for Bravery

Second Lieut. Dogan H. Arthur, pilot, Air Service, 12th Aero Squadron. The bronze oak leaf is awarded Lieut. Arthur for the following acts of extraordinary heroism in action October 18 and 30, 1918, to be worn on the distinguished service cross awarded him October 3, 1918. On October 18, 1918, while on artillery reglage, Lieut. Arthur and his observer were attacked by four enemy planes. His observer's guns were jammed, but Lieut. Arthur, with splendid courage and coolness outmaneuvered the hostile aircraft and escaped, although they followed his plane to within 25 meters of the ground, badly damaging it by machine gun fire. On October 30, 1918, Lieut. Arthur was one of a formation of nine planes which were to take photographs in German territory. Before the lines were reached six planes dropped out, but the remaining three entered the German lines, although the observed several large formations of enemy planes in the near vicinity. When they were 12 kilometers within the German lines they were attacked by eighteen enemy Fokkers. Regardless of his own safety, Lieut. Arthur engaged these planes in order to allow his companions to escape, and turned toward his own lines only when he saw them shot down. Then he fought his way home, and in the fight which ensued his observer shot down two enemy planes. Home address, W. D. Arthur, 632 East Main Street, Union, S. C.

First Lieut. Thomas M. Jervey, Ordnance, 1st Army Observation Group. For extraordinary heroism in action near Longuyon, France. Assigned to the 1st Army Observation Group, Air Service, armament officer, Lieut. Jervey volunteered as observer on a photographic mission from Ontedy to Longuyon, 25 Kilometers into the enemy lines. In combat with fourteen enemy aircraft which followed one enemy aircraft was destroyed. Lieut. Jervey, regardless of the fact that his plane was badly shot up and that his hands were badly frozen, continued on the mission, returning only upon its successful conclusion. Home address, Mrs. Frank J. Jervey, mother, 7 Pitt Street, Charleston, S. C.

Plywood in Aeroplane Construction

(*Continued from page* 947)

seriously constructed, is always in alignment, even after fatiguing flights, while prolonged exposure to the elements does not produce appreciable changes in this respect. Stresses up to the elastic limit of the material do not produce permanent deformations, while variations in temperature and humidity may be ignored. There is no more reason why an aeroplane should be repeatedly trued up than a ship should be subjected to such treatment, always assuming that corresponding methods of design and construction have been employed in both cases.

Already plywood has been used in the construction of certain portions of wings, notably in the leading edges, over which it is not easy to maintain a critical form with a covering of woven fabric. Portions which are exposed to injury, or are liable to be stepped on, are covered with plywood, and in some recent designs those portions which are severely influenced by the slip stream of powerful propeller have ben protected by plywood ccvering.

One of the serious problems in aeroplane construction has been the question of an ample supply of sound, thoroughly seasoned wood, especially of spruce. It does not seem to have been realized that the true solution of the spruce question lies in the employment of shaped and formed parts of plywood, using poplar, mahogany, gum, and other plentiful and wholly suitable woods. The reduction in weight is readily secured by the use of hollow members, especially for struts, spars, and similar parts, while for wing ribs there is nothing so good as properly disposed plywood.

The question of soundness is wholly in control of the maker, since the interior of the material is open and visible for inspection as it is laid up, and there need be no uncertainty in this respect. So far as seasoning is concerned, the thin sheets are readily dried when cut, and their freedom from moisture determined immediately, so that, instead of waiting for long periods of time for uncertain air drying, or the difficulties of kiln drying, with its accompaniment of possible case-hardening, etc., the plywood members may be manufactured from wood which, forty-eight hours before was lying in freshly-cut timber.

The real problem in the successful use of plywood in aeroplane construction lies in the determination of a moderate number of standardized parts, such as struts, wing-ribs, spars, and fuselage forms, capable of quantity production in accurately formed moulds, and not subject to continual and trifling alterations. There is every reason why such parts should be as thoroughly standardized as are rolled steel sections or standard drop-forgings, so that the designer may select from such standard shapes the parts required for any type of aeroplane upon which he may be working, and order these parts from stock, just as structural beams, girders, and rails are now ordered.

Such a standardization would facilitate, rather than hinder, freedom in general design, and strike the shackles from the aeroplane industry, and place it upon a true quantity production basis.

ANOTHER RECORD

AERIAL AGE

Was the First to Publish Correct and Complete Accounts of

(1) Liberty Motor, devoting twelve pages to a complete description, including forty illustrations.

(2) The Hispano-Suiza Aviation Motor, telling the complete story with twenty-six illustrations.

(3) Description of Naval Aircraft Factory with many photographs.

(4) The complete report of Hughes Aircraft Investigation.

(5) The complete aircraft reports by Secretary Baker, General Kenly, Secretary Daniels, Mr. J. D. Ryan and Postmaster-General Burleson.

(6) Aero Club of America plans for Captain Bartlett's flight to the North Pole to explore 1,000,000 miles of unexplored territory, to collect data on air currents as well as make soundings in the Polar Basin.

(7) The extensive plans of the Aero Club to foster aerial transportation, sport, etc., with list of seventeen trophies and prizes to be competed for during the coming year.

If you want to be in position to take advantage of the opportunities that are open in this field of aeronautics, advertise in and subscribe to AERIAL AGE WEEKLY, which has the largest circulation of any technical and trade aeronautical magazine.

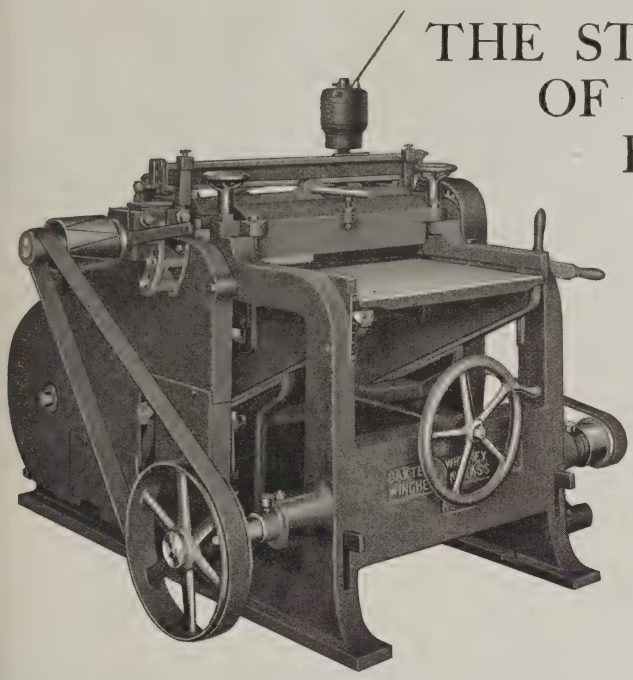
sinister or disloyal influence has affected production in the Ford plant. The factory manager testified that there had been no sabotage and no efforts to retard production. Results in the Ford Motor Company compare favorably with those in the best of the companies manufacturing Liberty motors. Its contract for 5,000 motors was let in November, 1917, nearly three months after contracts had been let to the Packard and Lincoln Companies for 6,000 each. Up to October 11, 1918, it had produced 1,868, while the Packard Company had produced 3,864 and the Lincoln Company 2,787. Not a case of sabotage has been reported to the Department of Justice from this plant. Indeed it can be said that but little trouble has been traced to aliens or alleged German sympathizers in any of the plants.

Sabotage

To what Judge Hughes has said on this subject I wish to add that since his report was handed to me I have had the records of the Department of Justice examined for the purpose of ascertaining the number of substantial complaints of sabotage in the factories engaged in manufacturing aircraft, motors, or parts for the Government. The result shows twelve such complaints. Upon these complaints and the investigations which followed seven men have been indicted, two of whom have pleaded guilty and five of whom are awaiting trial. In this connection it is interesting to note that during the past eighteen months somewhere between 100,000 and 200,000 laborers have been engaged on Government work in the factories indicated.

Respectfully yours,
(Signed) T. W. GREGORY,
Attorney General.



(Continued from page 936)

in this city on Tuesday night Lieut. Col. William A. Bishop, the Canadian ace, who has an officially certified record of seventy-two German planes brought down during the war in combat, declared that "the future of aviation is not in warfare, it is in commerce," and then he ventured to make a prediction:

"The first startling thing will be the transatlantic flight. At the end of another year I feel quite confident that scores of machines will have crossed the Atlantic."

The aviators will have to show some enterprise or the Zeppelins will sail into an Atlantic harbor first. Already, according to the *Echo de Paris,* the Germans are planning to convert military dirigibles into "aerial merchantmen." It is estimated that in fair weather they could travel at a rate of seventy miles an hour and remain in the air for several days. During the war a Zeppelin, carrying a crew of twenty-five men and twenty-five tons of munitions and medicines, started from Jamboli, in Bulgaria, to relieve General Lettow-Vorbeck in German East Africa, but turned back when sailing over Khartum upon receiving a wireless message that the German campaign had ended in disaster. The dirigible returned to Bulgaria after a voyage of 3,000 miles. This report has not been officially confirmed, but there seems to be no doubt that the Zeppelin, as improved by German inventors, is capable of traveling far enough to cross the Atlantic from Hamburg to New York in about fifty hours.

The aviators, therefore, must be up and doing if they are to make the Atlantic passage first. In their favor is the facility with which an aeroplane can be prepared for the adventure and its immunity from any handicap of strong winds. Unless the Zeppelin navigator could have weather specially arranged for him by Boreas, the great fabric would have to remain in its shed. Apparently Colonel Bishop believes that it would not be necessary to provide a giant, many-engined plane for the Atlantic trial. He has a preference for the small two-seater to make a dash across the ocean. Some daring fellow may probably be the Columbus of the air in such a craft. There will be plenty of volunteers to choose from. Some morning we may wake up and read in triumphant headlines that the thing has been done without a hitch—*Editorial in N. Y. Times.*

THE STRONG POINTS OF WHITNEY PLANERS

appeal to every wood-worker, such as a

RIGID FRAME with ample weight of metal—

BED raised and lowered on Solid Wedges operated on wide tracks—

HARDENED CENTER TABLE made extra thick—

AUTOMATIC CHIPBREAKER working concentric with the Cutter Head—

CLAMP CUTTER-HEAD BOXES easily removed from the machine—

CUTTER HEAD with long bearings of large diameter.

These are but a few of the features that enable Whitney Surfacers to do superior surfacing at the lowest cost.

Captain Victor H. Strahm, Air Service, pilot, 91st Aero Squadron. For extraordinary heroism in action near Metz, France, September 13, 1918. Captain Strahm displayed remarkable courage and skill in penetrating the enemy territory for a distance of 25 kilometers, flying at an altitude of less than 300 meters. His plane was subjected to intense fire from antiaircraft guns in the region of Metz, and he was attacked by a superior number of German planes, one of which he destroyed. He completed his mission and returned with information of great military value. Home address, Frank J. Strahm, Bowling Green, Ky.

First Lieutenant Oscar B. Myers, Air Service, 147th Aero Squadron. For extraordinary heroism in action near Cierges, France, September 28, 1918. Sent on a particularly hazardous mission, he harassed and routed enemy troops. Lieutenant Myers then climbed higher to look for German planes. With two other officers he encountered nine Fokkers protecting a reconnaissance machine, flying in one of the most effective formations used by the enemy. Outmaneuvering the hostile planes, the three officers succeeded in routing them. After a quick turn Lieut. Myers dived at the reconnaissance machine and crashed it to the ground in flames. Home address, S. Oscar Myers, 109 South Third Avenue, Mount Vernon, N. Y.

First Lieutenant William T. Badham, Air Service, observer, 91st Aero Squadron. For extraordinary heroism in action near Nuzancy, France, October 23, 1918. .This officer gave proof of exceptional bravery while on a photographic mission 25 kilometers within the enemy lines. His plane was attacked by a formation of thirty enemy aircraft; by skillful work with his machine gun, Lieutenant Badham successfully repelled the attack and destroyed two German planes. At the same time he manipulated his camera and obtained photographs of great military value. Home address, H. L. Badham, Whitaker Street, Birmingham, Ala.

First Lieutenant George C. Kennedy, Air Service, pilot, 91st Aero Squadron. For extraordinary heroism in action near Jametz, France, October 9, 1918. This officer gave proof of his bravery and devotion to duty when he was attacked by a superior number of aircraft. He accepted combat, destroyed one plane and drove the others off. Notwithstanding that the enemy returned and attacked again in strong numbers, Lieutenant Kennedy continued his mission and enabled his observer to secure information of great military value. Home address, L. Gordon Glazier, 4 Egremont Road, Boston, Mass.

First Lieutenant Benjamin L. Atwater, Air Service, observer, 99th Aero Squadron. For extraordinary heroism in action near Landres-A-St. George, France, October 5, 1918. Lieutenant Atwater started on a photographic mission with Lieutenant Alexander, pilot, over the enemy's lines. Forced back by seven enemy pursuit planes, he determined to complete his mission, and recrossed the line eight minutes later. A large group of enemy pursuit machines again attacked his plane. Disregarding his wound, he operated his machine gun with such effect that the nearest of the enemy planes was put down out of control. Home address, Mrs. Ella C. Atwater, mother, 152 Maple Avenue, Red Bank, N. J.

Second Lieutenant William J. Brotherton, Air Service, 147th Aero Squadron. For extraordinary heroism in action near Fere-en-Tardenois, France, on August 1, 1918. An enemy Rumpler plane being reported over the aerodrome, Lieutenant Brotherton with another officer ascended and soon encountered six Fokker planes that were protecting another Fokker serving as a decoy. Disregarding the enemy's superiority in numbers, he maneuvered so as to secure the advantage of the sun and dived on the decoy plane, pouring in a destructive fire. He killed the pilot and crashed the machine to the ground. Home address, C. J. Brotherton, Guthrie, Ill.

First Lieutenant Lansing C. Holden, Air Service, 1st Pursuit Group. For extraordinary heroism in action near Montigny, France, October 23, 1918. Lieutenant Holden was ordered to attack several German balloons, reported to be regulating effective artillery fire on our troops. After driving off an enemy plane, encountered before reaching the balloons, he soon came upon five balloons in ascension 1 kilometer apart. In attacking the first, which proved to be a decoy with a basket, his guns jammed; after clearing them he attacked the second balloon, forcing the observer to jump. His guns again jammed before he could set fire to this balloon. Moving on the third balloon at a height of only 50 meters, he set fire to it and compelled the observer to jump. He was prevented from attacking the two remaining balloons by the further jamming of his machine guns. Home address, L. C. Holden, father, 888 West End Avenue, New York, N. Y.

Major Harold E. Hartney, Air Service, 1st Pursuit Group. For extraordinary heroism in action near Fismes, France, August 13, 1918. Major Hartney voluntarily accompanied a reconnaissance patrol. Realizing the importance of the mission, Major Hartney took command, and, although five enemy planes repeatedly made attempts to drive them back, he continued into enemy territory, returning later to our lines with important information. The cool judgment and determination displayed by Major Hartney furnished an inspiration to all the members of his command. Home address, Mrs. Harold E. Hartney, care of Russell Hartney, Saskatoon, Saskatchewan, Canada.

Second Lieutenant Richard Wilson Steele, observer, Air Service, 166th Aero Squadron. For extraordinary heroism in action near Bois D'Barricourt, France, October 23, 1918. While on a bombing raid back of the German lines, Lieutenant Steele, accompanied by his pilot, was attacked by six German pursuit planes. They were forced to leave the formation in which they were traveling owing to engine trouble; the enemy began riddling their plane with machine-gun fire. Lieutenant Steele fought them on all sides and is credited by members of the 11th Aero Squadron, who were flying over him several thousand feet, with having brought down one of his opponents. He was wounded twice in the leg and twice in the arm and continued fighting, although each time he was hit he was knocked down into the observer's cockpit. At last, however, only his tail gun was in working condition, the other two having been disabled by bullets, and Lieutenant Steele sank unconscious into the cockpit. Home address, William Steele, father, 426 East Euclid Avenue, Oak Park, Ill.

First Lieutenant Hugh L. Fontaine, Air Service, 49th Aero Squadron. .The bronze oak leaf is awarded Lieutenant Hugh L. Fontaine for extraordinary heroism in action near Champigneulle, France, October 10, 1918. While leading a patrol of three other machines, Lieutenant Fontaine attacked four enemy planes in the region of Champigneulle. He succeeded in shooting down out of the enemy planes in flames. The first of these he shot down in the initial attack. The second he attacked while it was endeavoring to shoot down one of our planes which had been rendered helpless by the loss of one of its wings. He dived on the attacking plane and shot it down in flames. Home address, Dr. Bryce Fontaine, stepfather, 1839 Overton Park Avenue, Memphis, Tenn.

First Lieutenant Raymond P. Dillon, pilot, 24th Aero Squadron. For extraordinary heroism in action near Mezieres, France, November 3, 1918. Lieutenant Dillon exhibited courage in the course of a long and dangerous photographic and visual reconnaissance in the region of Mezieres with two other planes of the 24th Aero Squadron. Their formation was broken by the attack of ten enemy pursuit planes; five enemy planes attacked Lieutenant Dillon and his observer, who succeeded in shooting down two of these out of control. They then had a clear passage to their own lines, but turned back into Germany to assist a friendly plane with several hostile aircraft attacking it. They succeeded in shooting down one more of the enemy. Home address, Claude A. Dillon, brother, 5839 Prairie Avenue, Chicago, Ill.

"STANDARD" Postal Planes Make Remarkable Record!

Latest government figures, compiled to Dec. 1, 1918, show that up to that date the six "STANDARD" postal-planes that carry the mail between New York and Washington, made over 400 service flights of which only nine were interrupted for any reason whatsoever. Six of these interruptions resulted in negligible delays, and the other three held up the mail for only an hour or two.

This is a record for reliability of which the best train-service would be proud.

For peace-time duty as in war-time service, "STANDARD" Airplanes have proved their superiority.

AERIAL TRANSPORTATION IN THE U. S. AND ELSEWHERE

AS AERIAL AGE goes to press the energetic Captain Benjamin B. Lipsner is concluding the arrangements for the purchase of a number of large planes, each capable of carrying forty passengers.

This is as important an event in the history of aeronautics as was the placing of the first order for an aeroplane by the United States Army in 1907 or by the Navy in 1911 or by the Post Office last spring.

It is an epochal event. The example will be followed. We may expect that scores of concerns will be organized during the coming year to establish aerial transportation lines.

The coming Aero Show being organized by the Manufacturers' Aircraft Association, which has the support and co-operation of the Army, Navy, Aero Club of America and Aerial League of America, will do much to stimulate interest in aerial transportation. So will the aeronautic events being planned by the Aero Club of America and Aerial League of America.

The War and Navy Departments are to cooperate with the Manufacturers' Aircraft Association in the aeronautical exposition which the association is to hold in Madison Square Garden and the 69th Regiment Armory.

Cooperation was asked of the officials at Washington, and as a result Army and Navy representatives were sent to New York with lists of prospective exhibits. Great interest will be created by the exhibiting of the large Navy flying boat, the NC-1, which is capable of carrying fifty passengers, and which may attempt the passage of the Atlantic. The Army group includes a Handley-Page and a Caproni. In addition there are a number of captured German 'planes and a large quantity of trophies.

Other countries are going ahead with aerial transportation. The second flight from London to Egypt and to India has ended successfully. An air line is in operation between London and Paris. According to the despatches in order to remedy the slowness of correspondence with Alsace-Lorraine, the French Aeronautic Department has organized an air mail service between Paris and the principal towns of Alsace-Lorraine.

A regular aerial passenger service between London and Paris for the benefit of British members of the Peace Conference was opened on January 20. Several aeroplanes were fitted up for this purpose. They have a comfortable cabin for two passengers, including cushioned seats and a table, the whole inclosed with glass.

Major-General Sir W. Brancker, who recently visited America on a British mission, is taking an important post in connection with the Aircraft Manufacturing Company, of which Holt Thomas is managing director.

Announcement has been made already that this company is arranging an aerial passenger service between London and Paris. Plans will be developed in many other directions, including airlines from London to Glasgow, Edinburgh, Manchester, Newcastle, Wales and Ireland; also external lines from London to Sweden, Denmark, Holland, Spain and Italy.

Brancker will direct this scheme of aerial transport and also the higher aspects of international flying, the creation and development of an organization of pilots and aeroplanes. He will plan also the air routes over land, with landing grounds every ten miles, including a route from England to India, and at sea will look after the placing of a series of mark boats at intervals of 200 miles.

An American-British transatlantic air commerce line is one of the ultimate features which he will control, while still retaining the rank of Major-General in the Royal Air Service. Obtaining his services is regarded as a great triumph for the company.

THE AIRMEN IN CIVIL LIFE

THERE has been no small amount of speculation as to whether the men whom war placed in dangerous and spectacular work would be willing to return to the comparatively quiet and humdrum pursuits of peace. Inasmuch as the aviators were the men to whom opportunity for individual adventure and daring was afforded more than to any other class, the wonderment was most keen as to the occupations which they would select upon their return to civil life.

According to a statement of the Aero Club of America, the airmen do not wish to take up their careers where the call to war broke them off. They have sensed the thrills of the upper air; the conquest of a new element has fascinated them. The aerial mail service affords them an opportunity to continue their work in aviation; but many of them appear to find this tame and uninteresting. The commercial development of aviation offers another field. A London-to-Paris passenger and freight service is already in prospect; one from New York to Philadelphia is planned for the early summer. These offer fields for the development of speed and carrying capacity in planes; but they do not provide—and, indeed, it is doubtful whether anything can do this—a substitute for the thrills of meeting enemy planes in aerial combat.

Perhaps the particular calling which will offer the greatest attraction to the more adventurous aviators is the development of new types of planes. The early years of this century brought the automobile racer into prominence. One disadvantage of the holding of an aerial sweepstakes would be that it would be rather farcical to attempt to charge admission to spectators; but there would no doubt be enough prize money offered to make the winning of such events well worth while. Then there are the trans-Atlantic and trans-Continental flights yet to be achieved, and there might be a market for the "gentleman's speedster" type of plane. It may be that there will yet be thrills enough, even in a world at peace, to satisfy the most insatiable aeronaut.—*Editorial in Baltimore News.*

COLONEL DEEDS NOT TO BE COURT-MARTIALED

THE following correspondence is published by the War Department:

January 16, 1919.

Chairman, Committee on Military Affairs,
House of Representatives.

MY DEAR SIR:

Upon the submission to the President of the report of Honorable Charles E. Hughes, and the report of the Attorney General covering the Aircraft investigation. I directed that *the specific recommendations* contained in these reports *be extracted* for my consideration and for such action by me as might be required in the premises. These *extracts* were referred to the Judge Advocate General of the Army directing a thorough and comprehensive inquiry into the allegations affecting the conduct of Colonel Deeds. He was directed, not only to review all evidence taken by Judge Hughes, which the Attorney General kindly made available, but to secure all other facts obtainable in this case.

The Judge Advocate General committed the matter to a board of review consisting of officers of high ability and character wholly disassociated from any previous business or personal relations either with Colonel Deeds or with any matters affecting aircraft production. This board carefully and systematically examined all of this evidence and obtained all possible additional facts and its conclusions are, therefore, based upon fuller inquiry than was found possible within the time and opportunities at the disposal of Judge Hughes, and this examination is in effect the accomplishment of the thorough inquiry which Judge Hughes had in mind when he suggested that these transactions be examined by a Court-Martial. The purpose of Judge Hughes' suggestion is therefore accomplished.

This record undoubtedly shows that Colonel Deeds, absorbed in the activities of Aircraft Production, neglected to give his personal attention to transactions affecting his personal financial affairs, and this neglect on his part gave rise to appearances which required painstaking investigation in order to show their true character.

The unanimous report of this board of review, approved by the Acting Judge Advocate General, recommends that Colonel Deeds be not tried by Court-Martial on any of the grounds suggested, and this recommendation has been approved by me.

Colonel Deeds was one of a large group of men who came to Washington at great personal and pecuniary sacrifice to render service to the Government in the great emergency caused by our participation in the war.

My duty as Secretary of War with regard to any public servant under my jurisdiction is clearly to bring about proper punishment for wrongdoing and equally clearly to protect those public servants whose conduct is faithful and upright against embarrassment, humiliation or loss.

Very wide publicity has been attached to the acts of Colonel Deeds as a member of the Aircraft board. Whether it will ever be possible to overtake the judgments which have been formed upon partial information on this subject, I do not know; but this department will make every effort to secure the widest publicity for the action now taken and for the grounds upon which it rests. To carry this into effect, I am therefore transmitting to your Committee for its information, and with the request for its publication in the Record, if the proprieties of the situation permit, a copy of the report of the Judge Advocate General. Similar copies are being furnished the Chairman, Committee on Military Affairs, United States Senate, the Attorney General and Colonel Deeds.

Inasmuch as the purpose of Judge Hughes' suggestion has been accomplished, I have directed that all the records in this case be filed in the War Department and that this matter be considered as closed.

Cordially yours,
NEWTON D. BAKER,
Secretary of War.

December 26, 1918.

MEMORANDUM FROM THE CHIEF OF STAFF:

SUBJECT: Proposed court-martial proceedings in the case of Colonel Edward A. Deeds, Signal Corps.

REVIEWED by THE BOARD OF REVIEW—READ, (Chief of Division) MILLAR, TUCKER and KEEDY, judge advocates.

1. Pursuant to the reference to this office of the report of Judge Hughes of the Aircraft Inquiry for review and recommendation (1) as to what disciplinary action, if any, should be taken with reference to the persons affected, and (2), as a subsidiary matter, for a statement from this office as to the desirability of granting requests of certain officers therein mentioned, for courts of inquiry, independently of any action which might be recommended as to disciplinary measures to be taken, this office submitted under date of November 11, 1918, a memorandum on the subject, *based solely upon the report of Judge Hughes* hereinabove referred to, and containing certain recommendations, among which was a recommendation that Colonel E. A. Deeds be tried by court-martial upon charges based upon certain facts set forth in said memorandum.

2. The memorandum from this office hereinabove referred to has since been returned with instructions to examine the question with regard to the case of Colonel Edward A. Deeds "with reference to all the facts obtainable," and to base the advice of this office on inspection of the evidence taken by Judge Hughes and all other facts obtainable with the suggestion that this office send for Colonel Deeds, his former counsel, Judge McCann, of Dayton, Ohio, Mr. W. W. Montgomery, counsel for the Aircraft Board, and any other persons who might aid in the inquiry.

3. Pursuant to these instructions Colonel Deeds, Judge McCann, and others who were in a position to lay before this office facts in addition to those referred to in the Hughes report, were sent for and interviewed. At the request of this office sworn statements have been submitted by Colonel Deeds, Judge McCann, H. E. Talbott and George B. Smith (Col. Deeds' confidential agent), and an unsworn statement by Major E. A. Coleman, Disbursing Officer, Bureau of Aircraft Production. In addition consideration has been given to letters from Hon. John D. Ryan, Director of Air Service, referred to this office by the Secretary of War, and to a letter from Mr. Montgomery, submitted by Mr. Ryan, all of which statements and letters are forwarded herewith. After reading these documents and the testimony relating to Colonel Deeds given at the inquiry made by Judge Hughes, and after careful consideration of the subject referred to it, this office submits the following memorandum:

INTRODUCTORY

4. In order to understand the true bearing of the transactions criticized by Judge Hughes in his report upon the relations between Colonel Deeds and the Government, it will be necessary to mention briefly the business associations of Colonel Deeds at the time the call came to him to serve the Government, together with events immediately preceding his being commissioned an officer in the United States Army.

In the early part of 1917, Mr. Deeds was a man of wealth, well-known in the field of aircraft development. He was a large holder of stock in the Dayton Metal Products Company, which had profitable fuse contracts with the British Government and other contracts with the United States Navy Department, and which had accumulated a considerable surplus in its treasury. Mr. Deeds was vice-president of the company, receiving as such a salary of $25,000 a year. He had also been a large stockholder in what was known as the Delco Company, the stock in which, owned by him and his associates, had been sold to the United Motors Company for several millions of dollars in cash and, in addition, stock in the company. He was president of the latter corporation, drawing as such a salary of $60,000 per year. He was also largely financially interested in the Domestic Building Company, which owned the land and erected the building in Dayton, Ohio, subsequently acquired by the Dayton Wright Airplane Company for its principal aeroplane plant. On April 9, 1917, the Dayton Wright Airplane Company was incorporated, taking over the Orville Wright Airplane Corporation, in which Deeds had also been financially interested before that time. Deeds was an incorporator of the Dayton Wright Airplane Company, in which he had intended to become a stockholder and of which he intended to become vice-president, until his plans were changed because of his subsequent connection with the Government, as will be hereinafter recited. In all these enterprises he had been very closely associated with Charles F. Kettering, H. E. Talbott, senior, and H. E. Talbott, junior. Relations between these four gentlemen appear to have been unusually close and friendly.

On March 6, 1917, Mr. Deeds was requested by the Secretary of War to serve on a commission to be known as the Munitions Standards Board, which was constituted to be an "advisory channel through which may be made available to the various departments of our military establishment the civilian expert technical and commercial knowledge in matters relating to the procurement of munitions and supplies."

The Secretary of War in the letter of appointment, informed Mr. Deeds that he was asking him to undertake this patriotic service for the country, although there was no authority of law for compensating him in any financial way for personal services. This appointment Mr. Deeds at once accepted. A family bereavement prevented him from performing any duty on the Board.

On April 4, Mr. Deeds reecived a telegram from Mr. Howard Coffin, of the Council of National Defense, requesting him to come to Washington at once, and to bring with him Kettering and Talbott. These three gentlemen came to Washington, and Mr. Coffin stated in a somewhat indefinite way that the Government needed men of experience to help work out the aeroplane problems in Washington. In response to Mr. Coffin's request that Messrs. Talbott and Deeds make an industrial survey of the United States with a view to apportioning the raw materials between war necessities and business in anticipation of shortages of raw materials, these two gentlemen spent a few days in consideration of the subject, but the project proved impractical and they returned to Dayton. Mr. Coffin afterwards communicated with Deeds with reference to his becoming a member of a committee to aid in the aviation project, in response to which Mr. Deeds sent the following telegram:

Washington, D. C.
May 10, 1917.

HOWARD E. COFFIN,
Darien, Georgia.

Appreciate very much your confidence in suggesting me on aviation commitee. Two things are troubling me. First, we will sell bonds and let contracts on conservancy this summer, which will require one-half my time after June fifteenth and this must take precedence. Twenty-five millions are to be spent. Second, my activity as Vice-President of the Dayton Wright Airplane Company might bring criticism. You may not know that our Dayton crowd got behind Orville Wright long before war was declared. Our first factory building one hundred by five hundred will be occupied in about six weeks. Our motive is to do some constructive work in aviation and our whole development force is being directed toward that end. We will undoubtedly build machines for the Government and the public might not understand. For these reasons I doubt the wisdom of my accepting. Whether I sit on the board or not, you may give me any specific job such as locating and building a supply station, equipping a field, or anything else, and I will come across as best I can. Would like your advice before giving final decision.

E. A. DEEDS."

THE NEWS OF THE WEEK

Aeronautic Exposition Plans Progressing

As the result of a conference held January 15 at the offices of the Manufacturers Aircraft Association, it is assured that the Aeronautical Exposition of the Association is to be one of the most remarkable affairs ever presented in the history of the United States.

When the Manufacturers Aircraft Association decided that aeronautics had a commercial future and therefore that the exposition was justified, it presented the proposition to the War and Navy Departments, with a request for cooperation and advice. The aeronautical industry from the time we entered the war against Germany has been closely bound up with the Government, and therefore it was natural for the association to turn to the two great Departments for counsel. The response was extraordinarily gratifying. The officials became personally interested in the idea of holding in New York City an exposition of national character. Heads of the various bureaus undertook to collect a possible list of exhibits, and on January 15 at the conference in this city these lists were presented for mutual consideration.

Commander G. C. Westervelt and Lieutenant Commander A. C. Read, represented the Navy. Major H. M. Clark, Major Henry J. Miller, Captain L. E. Rubel, Captain J. S. Maholl, Captain Roy Francis and Lieutenant John Tuerk represented the Army.

It is impossible at the present time to make public the lists as submitted by the Navy and Army representatives, but it may be stated with authority that never in the history of the United States have the Departments been able to gather together such a remarkable collection, judged from military, naval, scientific and commercial standpoints as that which will be available for the manufacturers' exposition.

The Navy has suggested for exhibition more than half a dozen aeroplanes and flying boats, one of which is the famous "NC1," which not long ago at Far Rockaway carried fifty passengers in a flight of considerable length.

The Army has in mind for the exposition twenty-five aeroplanes, some ten or more of which are foreign types. These include war trophies, among which are the latest examples of German aerial manufacture. Included in the proposed Army exhibit are a Handley Page and a Caproni. This is interesting inasmuch as it will enable the Manufacturers Aircraft Association to present to America for the first time at one place the greatest examples of aeroplane construction in the United States, Great Britain and Italy. In addition a representative group of airships, it is expected, will be included from France and Germany.

While, of course, it will not be stated absolutely that all of these planes will be placed on view, it is known that the committees representing the Army, Navy and Manufacturers Aircraft Association are working along these lines, and therefore announcements may be expected shortly.

It was evident from the lists as submitted by the Army and Navy that these Departments regarded the manufacturers' exposition as an extraordinary opportunity to present to the public the achievements of America in the air.

The lists of proposed planes, instruments and trophies reveal items around which heretofore secrecy was maintained due to military necessity. But now that the power of Germany is broken and the war virtually at an end, the Departments feel at liberty to take the world into their confidence and tell exactly how much America accomplished during the eighteen months we were in the conflict. Both Departments have proposed to stage demonstrations inside and outside of Madison Square Garden, and it is thus assured that the exposition will assume a semi-official character. It is evident from this that the Garden will be too small to house all the exhibits available from the Government and the various manufacturers, therefore it may be regarded as probable that the Manufacturers Aircraft Association will hold simultaneous shows in other available places. In this connection one or more of the armories have been mentioned, and negotiations are under way to obtain them for the period.

Macauley Plans New Flights

Fort Worth, Tex., January 18.—Major T. C. Macauley, commanding officer at Taliaferro Field, will soon attempt to fly from Fort Worth to San Diego and return in forty-eight hours and another to Jacksonville, Florida, and return. Major Macauley has made a round trip to the Pacific Coast in four days.

New Air Chief Receives D. S. M.

Upon recommendation of General Pershing, the Distinguished Service Medal has been awarded to Major General Charles T. Menoher, U. S. Army, for exceptionally meritorious and distinguished service. He was in command of the 42nd Division from Chateau-Thierry to the conclusion of the Argonne-Meuse offensive, including the Baccarat Sector, Rheims, Vesles and St. Mihiel Salient, with his division, he participated in all of these important engagements.

In awarding the medal, it is mentioned that the reputation as a fighting unit of the 42nd Division was in no small measure due to the soldierly qualities and the military leadership of General Menoher.

Capt, J. Norman Hall Set Free

Washington, January 19.—Captain James Norman Hall, according to information from the War Department, has been released together with 135 other war prisoners. Captain Hall was driven down behind the German lines last May, as a member of the Lafayette Escadrille.

Automobile Association to Hold Banquet for Capt. Rickenbacker

Captain Edward V. Rickenbacker, erstwhile champion automobile race driver, and, by virtue of his official record of bringing down twenty-six "Hun" fliers, America's leading "Ace," is to be the guest of honor at a banquet arranged by the Contest Board of the American Automobile Association, on behalf of the automotive sport and industry of the United States, which will be held in the ballroom of the Waldorf-Astoria February 3.

Vedrines Lands On Roof

Paris, January 19.—Jules Vedrines, the French aviator, landed in a plane on the roof of the Galleries Fafayette. The feat is notable, for the roof is fenced about by sky signs and other erections, its dimensions being approximately 46 feet in width and in length about 82 feet. The width of the aeroplane used by Vedrines is 39 feet.

For being the first airman to accomplish the feat of landing on a roof Vedrines is the winner of a $5,000 prize.

Air Service Histories

Special efforts are being made to secure the histories of every aero squadron that has been in the American Expeditionary Forces for use in the history of the Air Service. Lieut H. W. Heintz, A.S., has been detailed to the Aeronautical Information Branch of the Executive Section, D. M. A., to carry out this work in the United States. The original copies of the squadron histories will be kept in the Aeronautical Information Branch at Washington, carbon copies being forwarded to the Information Section, Air Service, A. E. F.

May Prohibit Hunting By Air

St. Paul, Minn.—Minnesota's game laws may have to be amended to protect its ducks and geese from a new menace. State game wardens are considering the suggestion that the Legislature be asked to pass a bill tihs winter making it illegal to hunt feathered fowl from aeroplane.

Minnesota has turned out a great many aviators. It is understood that many aviators who observed the flight of ducks late this autumn decided that the modern hunter will travel in the air "bus."

From casual discussion the possibility of such hunting has caused statewide attention. Game wardens believe that ducks and geese could be slaughtered by aviators. Therefore, there is a possibility that the State Legislature will forestall such hunting.

Navigation Maps for Airmen

Washington.—Aerial navigation maps are included, under War Department orders, in the permanent military maps to be prepared and kept up to date in the records of the Department.

The purpose is to furnish military aviators with accurate route guides in flying from one place to another.

Areas to be mapped out will consist of zones twenty miles wide and connecting such cities and training centers as may be designated by the chief of staff.

Columbia to Honor Aces

Columbia plans special honors for two of its athletes who were named in the official list of American aces published in AERIAL AGE last week. Lieutenant Francis M. Symonds, of 20 West Eighth Street, and Lieutenant G. De Freest Larner are the two aviators Columbia contributed to the ranks of the Yankee aces. Symonds, according to the list, brought down five German planes, while Larner received credit for bringing eight to earth.

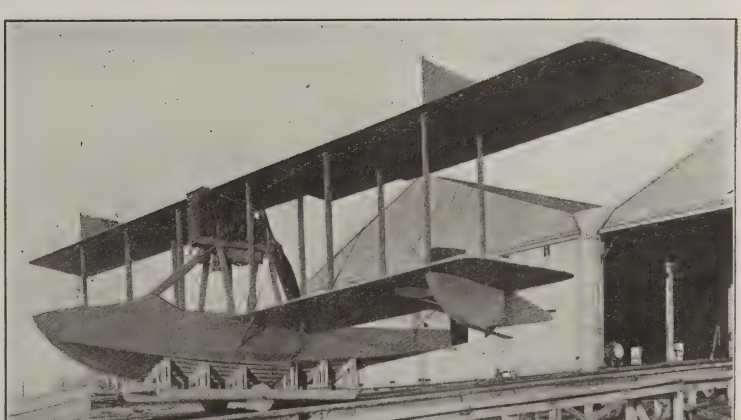
Lieutenant Symonds was captain of the Columbia 'Varsity football eleven of 1915, the team which went through the season without a defeat. He was a member of the class of 1916, and rowed in the freshman eight at Poughkeepsie in 1913. He was noted for his punting.

Lieutenant Larner was in the class of 1920, and was a freshman when the war broke out. He had won a place in the outfield of the 'Varsity baseball team.

Monument to Aviators

Officers of the Division of Military Aeronautics will cooperate with the Interior Department in erecting a memorial to aviators killed in the War.

The following named officers are constituted a Board to meet at the call of the President for the purpose of assisting and cooperating with the Secretary of the Interior and Mr. George B. Dorr in the matter of the erection of a monument in the Sieur de Monts National Park to the aviators who have died during the war: Major General W. L. Kenly, A. S. A.; Colonel F. R. Kenney, A. S. A.; Colonel Arthur Woods, A. S. A., and Captain Grover O'Neill, A. S. A.



Aero Units En Route

Following organizations have been assigned to early convoy: 17th Aero Squadron, 4 officers, 154 men; 148th Aero Squadron, 4 officers, 154 men; 657th Aero Squadron, 2 officers, 149 men; 636th Aero Squadron, 3 officers, 147 men; 474th Aero Squadron, 7 officers, 460 men; 12th Balloon Company, 6 officers, 174 men; 102d Balloon Company, 8 officers, 170 men.

R. M. A.'s

The following named officers have been rated as Reserve Military Aviators, the date set after their respective names:

Major Charles Herrick Hammond, A. S. A.,

The Curtiss Model MF flying boat with a Curtiss OX5 engine at Port Washington, L. I.

January 8, 1919; Captain L. E. McQuitty, A. S. A., January 6, 1919; Captain Raymond Wilcox Smith, A. S. A., January 8, 1919; Captain Brady Walter Warner, A. S. A., January 8, 1919; 1st Lieut. Paul Royal Corner, A. S. A., January 8, 1919; 1st Lieut. Harry Walker Colmery, A. S. A., January 8, 1919; 1st Lieut. Forrest Smith Emery, A. S. A., January 8, 1919; 1st Lieut. Joseph S. Pliska, A. S. A., January 8, 1919; 1st Lieut. Eben Stanley, A. S. A., January 8, 1919; 1st Lieut. Albert Hector Torongo, A. S. A., January 8, 1919; 1st Lieut. A. W. Vanaman, A. S. A., January 6, 1919; 2nd Lieut. Clyde M. Allen, A. S. A., January 7, 1919; 2nd Lieut. Charles Cla k Bowen, A. S. A., January 8, 1919; 2nd Lieut. Otto F. Burney, A. S. A., January 6, 1919; 2nd Lieut. John S. Childs, A. S. A., January 9, 1919; 2nd Lieut. C. F. Cocke, A. S. A., January 8, 1919; 2nd Lieut. Elmer Fred Degon, A. S. A., January 8, 1919; 2nd Lieut. Wallis A. Frederick, A. S. (M. A.), January 6, 1919; 2nd Lieut. Taylor Nathan House, A. S. A., January 8, 1919; 2nd Lieut. John Prescott Hoyt, A. S. A., January 8, 1919; 2nd Lieut. Ellis A. Noland, Jr., A. S. (M. A.), January 9, 1919; 2nd Lieut. Mark H. Redman, A. S. A., January 6, 1919; 2nd Lieut. Watkins Wendell Reynolds, A. S. A., January 8, 1919; 2nd Lieut. Frederick H. Winston, A. S. (M. A.), January 6, 1919; Captain R. S. Porter, A. S. A., December 3, 1918; Captain R. H. Torrey, A. S. A., December 3, 1918; Captain Frank F. Dell, A. S. A., January 10, 1919; 1st Lieut. Harmar D. Denny, Jr., A. S. A., January 10, 1919; 2nd Lieut. John C. Bennett, A. S. A., January 10, 1919; 2nd Lieut. J. F. Dworschak, A. S. A., January 10, 1919; 2nd Lieut. H. A. Gulley, A. S. A., January 11, 1919; 2nd Lieut. George K. Rice, A. S. A., January 10, 1919.

Plans for Air Service

The suggested bill presented by Secretary Baker to Congress for the American Army on January 16th, included 1,923 officers and 21,853 men for the Air Service, specified as follows:

1 Major General	2,282 Sergts. 1st class
1 Brigadier General	1,737 Sergeants
22 Colonels	134 Mess Sergts.
45 Lieut. Colonels	2,485 Corporals
126 Majors	134 Buglers 1st class
438 Captains	2,738 Wagoners
696 First Lieuts.	584 Cooks
594 Second Lieuts.	4,366 Pvts. 1st class
1,923 officers	134 Buglers
515 Master Signal Electricians	6,744 Privates
	21,853 Enlisted Men

The Secretary of War reported to the Press January 16, 1919, as follows:

The Bill presented to the House Committee on Military Affairs today is the result of the study made by the General Staff for the creation of an army of five hundred thousand men, divided into such organizations and arms as have been shown by our experience in this war to be appropriate. Under the law as it now is, the present army is in process of demobilization. Some provision is therefore necessary to authorize a regular army for the transition period and until the situation growing out of this war is sufficiently clarified to enable the United States to determine the permanent military policy which will have a proper relation to its needs and obligations. No effort is made in tihs bill to treat the question of universal training or service, but merely to produce an army deemed adequate to meet obligations and needs which can now be foreseen.

In addition to this, the bill provides for the legalization of the present relations and organization in the General Staff in order to preserve what we have built up as the result of experience and growth. The present organization of the War Department is of course a wide departure from the organization which existed before we went into the war, and it is wiser to keep what we have than to go back to the beginning and start over at some future time. It is a part of the purpose of this bill to enable the government to officer the newly constituted regular army by retaining in the service officers of proved ability who have come in either from the national guard or from civil life during the war and who desire to make the army a permanent career. The principle of promotion by selection rather than by strict seniority is introduced above the grade of captain. During the war of course promotion has been by selection, and our experience shows it to be both a wise and a just method of promotion.

Officers Honorably Discharged

The following officers of the D. M. A. have been honorably discharged from the service of the Government.

Ralph C. Cook, Second Lieutenant, A. S. A.; Edward A. Robinson, Captain, A. S. A.; Hartwell L. Hall, Second Lieutenant, A. S. A.; Robert L. Warfield, Second Lieutenant, A. S. A.; James M. Magee, Captain, A. S. A.; Edward A. Stinson, First Lieutenant, A. S. A.; William J. R. Taylor, First Lieutenant, A. S. A.; Ward Bowers Fletcher, Second Lieutenant, A. S. (M. A.); Roy P. Crany, First Lieutenant, A. S. A.; James A. Higgs, Jr., First Lieutenant, A. S. A.; Duncan Langdon, First Lieutenant, F. A.; Roger Tuckerman, Second Lieutenant, A. S. A.; Henry A. McAleenan, Second Lieutenant, A. S. A.; Roy L. Helstrom, Second Lieutenant, A. S. A.; Lawrence G. Ganniny, Second Lieutenant, A. S. A.; Wm. R. Greogory, Second Lieutenant, A. S. A.; Edward R. Spiegel, Captain, A. S. A.; E. Hubert Litchfield, Major, A. S. A.; Charles F. Mills, Second Lieutenant, A. S. S. C.; Pendleton Howard, Second Lieutenant, A. S. A.; Michael A. Kiely, First Lieutenant, A. S. A.; Harry H. Singletary, Second Lieutenant, A. S. A.; Ralph Earle, First Lieutenant, A. S. A.; Edwin C. Smith; Second Lieutenant, A. S. A.; Theodore Sizer, First Lieutenant, A. S. A.; Nathaniel P. Davis, Second Lieutenant, A. S. A.; William G. Boggs, Second Lieutenant, A. S. A.; Philip E. Chase, Second Lieutenant, A. S. A.; William Bernard, First Lieutenant, A. S. A.; Edwin M. Eustis, Second Lieutenant, A. S. S. C.; Robert W. Pringle, Second Lieutenant, A. S. (M. A.); George H. Hannun, First Lieutenant, A. S. A.; Horace L. Stevenson, First Lieutenant, A. S. A.; Harry A. Irwin, Second Lieutenant, A. S. A.; David G. Logg, First Lieutenant, A. S. (M. A.); Lewis H. Mahony, Second Lieutenant, A. S. A.; Royal W. King, Captain, A. S. A.; Ray C. Bridgman, Captain, A. S. A.; Hyland P. Stewart, Second Lieutenant, A. S. A.; George D. Riedel, Second Lieutenant, A. S. A.; James M. Mason, First Lieutenant, Inf.; Anton Pieron, Second Lieutenant, A. S. S. C.

Phones from Air to General Kenly's Desk

A conversation was held Thursday morning, January 16, between Major General W. L. Kenly, Director of Military Aeronautics, seated before the ordinary desk telephone in his office, and Lieutenant Lucas of the Air Service, piloting a radio-equipped aeroplane. This communication involved the use of the telephone lines of the Chesapeake and Potomac system in combination with aeroplane radio. The connection between the line and wireless systems was made at the local radio station at Bolling Field, where apparatus was connected in such manner that speech originating in either system would be automatically transmitted over the other.

General Kenly, Colonel F. R. Kenney and Colonel C. C. Culver were among the Air Service Officers present in the office of the Director, and each talked with Lieutenant Lucas, who was piloting an aeroplane from Bolling Field. General Kenly's office 'phone was used and connected through in the ordinary manner with the branch line running to the radio hut at Bolling Field. At this point the conversation was automatically transferred to the radio system, by means of which it reached Lieutenant Lucas, the connection between the two systems being effected by means of apparatus and circuits designed and installed by members of the radio branch of the Air Service, under the supervision of Colonel Culver.

The aeroplane radio telephone has been in use for something over a year, and air fleets are being commanded by the voice of their commanders at several flying fields over the country. During the last summer communications have been made at some of the fields, in which conversation from the pilot in the air has been automatically transferred to land lines on the field with success, and conversation starting over land lines has been automatically transferred to radio, and by this means reaching the pilot in the air. The conversation yesterday morning, however, was the first official demonstration of a two-way conversation direct between a person using a line telephone and an aviator in flight.

Service Grant Suggested

Senator Vardaman on January 17th introduced a bill granting a bonus of $216 to all officers and enlisted men who served abroad and $180 to all who served in the United States.

Caproni Flies from Detroit to Dayton

Detroit.—A big Caproni bombing aeroplane, one of three built in Detroit, flew from Detroit to Dayton, Ohio. It was piloted by Capt. Edward L. Williams, Jr., chief instructor at the aviation field at Mineola, N. Y., and carried four passengers.

The plane, which has a wing spread of seventy-five feet, is equipped with four Liberty motors, capable of developing 1,050 horse-power.

In addition to the pilot those in the machine were Capt. U. V. D'Annunzio, son of Major Gabrielle D'Annunzio, Italian poet and avitor; Lieut. A. G. Lodewyck, Lieut. H. L. Harris and George Buzane, an automobile race driver, who is acting as guide on the trip.

Naval Officers detailed to supervise work at the Curtiss Engineering Corporation, Garden City. From left to right:—Lieut. J. K. Roosevelt, Lieut. William J. Lee, Captain S. V. Parker, Commander H. C. Richardson, Lieut. S. S. Pierce, Lt. Comdr. H. Wesson, Ensign T. P. Wright, Machinist Danly, Ensign T. J. McCarthy, Ensign G. N. Gregory, Ensign H. B. Sanford

The AIRCRAFT TRADE REVIEW

A. E. J.

Curtiss Offices Move to New York City

The Sales and Advertising Departments of the Curtiss Aeroplane and Motor Corporation have been moved from Buffalo to 52 Vanderbilt Avenue, New York City. At this location, representatives of the parent organization and subsidiary organizations will take care of duties formerly attended to in various cities, principally Buffalo. In fact, the new offices will be a general headquarters for all branches of the Curtiss Company, including the Curtiss Aeroplane & Motor Corporation, Curtiss Engineering Company, and the Curtiss Exhibition Company, which controls the flying schools.

Mr. J. P. Davies has been made General Sales Agent. Other officers of the Company who will be located here are C. W. Webster, E. H. Ballard, and F. Leon Faurote, Advertising Manager.

Prossen with Nilson-Miller

L. P. Prossen has resigned as Mechanical Superintendent of the Black & White Taxicab Company, New York City, and become associated with the Nilson-Miller Company, of Hoboken, N. J. Mr. Prossen has been elected Vice-President and will be in charge of the Gear Cutting, Piston and Piston Ring Departments.

Herring with Ferdinand & Co.

Lloyd C. Herring has joined L. W. Ferdinand & Company as sales manager. For more than thirteen years Mr. Herring was connected with the Boston Office of the General Electric Company and for the past ten years as assistant to the District Manager of the Apparatus Sales Department of that Company.

S. A. E. Anuual Meeting

Over 800 tickets have already been taken for the Victory Dinner of the Society of Automotive Engineers to be given at the Hotel Astor, New York, on February 6th. It is expected that the number of S. A. E. members in attendance together with their guests will amount to 2,000. This social gathering of the automotive engineers will, aside from S. A. E. Midnight Whirl Party atop the Century Theatre, mark the conclusion of the most promising annual meeting held by the man who developed the American motor car and motor truck and are responsible largely for the progress made in aeronautics, motor boats, farm tractors and semi-portable farm units.

Four technical sessions will be held on February 5th and 6th, the Standards Committee making its final recommendations to the Society for the curent half-year on February 4.

President Charles F. Kettering will tell of the results of his investigations of more efficient utilization of fuel. Dr. David White, chief geologist of the U. S. Geological Survey, will report on the unmined supply of petroleum in the United States. Dr. E. W. Dean, of the Bureau of Mines, will speak on the status of refinery practice with particular reference to cracking methods. Dr. J. E. Pogue will give an interpretation of the engine fuel problem. Dr. H. C. Dickinson, of the Bureau of Standards, will present a paper on the status of engine efficiency in the United States. An estimate of the extent and utility of Mexican crudes in the near future will be given by E. De Golyer.

The effect of aeronautic engineering practices on motor car design and construction will be discussed comprehensively by H. M. Crane, of the Simplex Motor Car Co.; Howard Marmon, of Nordyke & Marmon, and O. E. Hunt, of the Packard Motor Car Co. D. McCall White, of the Cadillac Motor Car Co., will talk on the high-efficiency automobile engine. Thermodynamic cycles of the future will be treated by Sidney A. Reeve.

A. Ludlow Clayden will open a discussion on the need for lighter and more efficient cars.

In connection with motor truck engineering, John G. Utz will give historical notes on military truck standardization, and Major A. B. Browne is scheduled tentatively to outline some lessons in truck design developed by the war.

Live topics involved in the design and use of tractors of the farm, industrial and military types, are to be taken up. Lieut.-Col. Herbert W. Alden will speak on the U. S. Army tanks. Lieut.-Col. William Guy Wall will analyze automotive ordnance apparatus. A paper by G. W. Watson on British tanks is expected from England. Edward R. Hewitt will present a paper on the principles of the wheeled farm tractor.

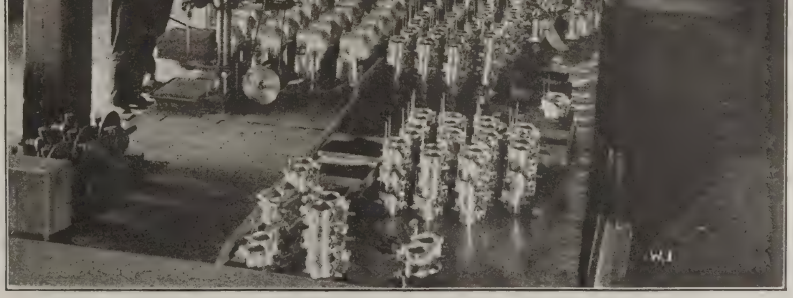
The most spectacular and in a way the most compelling session will be that on aeronautics. John W. Smith will describe the fixed radial cylinder type of aeronautic engine. J. G. Vincent, of the Packard Motor Car Co., and until recently chief of the Airplane Engineering Division, Bureau of Aircraft Production, will give an authoritative and complete statement regarding the Liberty engine. An entertaining and illuminating presentation on forest products for aircraft use will be made by Cylde H. Teesdale.

The Navy Department will co-operate very generously in the program, Commanders H. C. Richardson and F. G. Coburn speaking respectively on airplane and seaplane engineering and production. Starr Truscott will have dirigibles as a subject. It is hoped that Commander J. H. Towers will tell of the operation of naval aircraft.

George F. Crouch will speak on the automotive application of marine engines in the war.

Practical Aviation

Practical Aviation, by Major J. Andrew White, is a text book for intensive study by men preparing to become military aviators, containing all the knowledge of fundamentals required prior to actual flying and air combat.



Each subject is presented by illustration and described completely for the reader without turning the page.

A broad treatment of subjects never before contained in general aeronautic text books is included, comprising operating and care of aviation engines, reconnaissance, map reading, signaling and cooperation with military bodies, radio and its uses, machine gunnery and bombing from aeroplanes.

Following is table of contents: The Theory and Principles of Flight; Elements of Aeroplane Design; Flight Stability and Control; Materials, Stresses and Strains, Rigging the Aeroplane; Fundamentals of Motive Power; Pistons, Valves and Carburetors; Ignition, Cooling and Lubrication of Engines; Types of Motors, Operation and Care of Engines; Instruments and Equipment for Flight; First Flights, Turning and Landing; Night Flying, Cross-Country Flight, Map Reading; Aerobatics; Meteorology for the Airman; Aerial Gunnery, Combat and Air Tactics; Observation, Reconnaissance and Fire Spotting; Bombing.

Definitions of aviation terms with their French equivalents and *phonetic pronounciation*. The book is designed particularly for individual and class study, with an analysis of important factors preceding each chapter and a set of review questions following every division.

This book can be purchased at The Aeronautic Library, Inc., 299 Madison Avenue, N. Y. C., at the price of $1.75 postpaid.

Progress in Preparation for Air Mail Service Between New York and Chicago

The Post Office Department authorizes the following:

Important progress in preparation for the New York-Chicago air-mail service was announced recently by the Post Office Department. While Otto Praeger, Second Assistant Postmaster General, in charge of aerial projects, was unable to announce the exact date on which the Atlantic Seaboard-Great Lakes route will be in operation, he declared that thorough plans for the utilization of war material as far as possible and the modification of unsatisfactory equipment should be completed within a few weeks and that flights would be made on schedule.

"Very few persons realize what an undertaking this is," said Mr. Praeger. "Never has a trip by air been undertaken whereby a ship leaves for an 800-mile voyage, one each way a day, flying over mountains with very few landing places —an undertaking which six months ago would have been regarded absolutely impossible. When you consider that this is being done with a single-motored plane the task is stupendous. This has never been attempted, either in America nor in any other country of the world, and great credit is due to the organization undertaking it.

Military Planes Not Suitable

"Through the absence of the fullest degree of co-operation the New York-Chicago air mail service was deprived of essential support. Our experiments demonstrated that military construction, especially the type available last December, was neither safe nor economical for mail purposes, and the Post Office Department, with a full appreciation of the desirability of utilizing all material left over from the war, is endeavoring to work out a system whereby there can be developed a ship capable of carrying at least 250 pounds of mail and yet afford the pilot the maximum degree of safety.

"A military plane is designed for military purposes, not mail or commerce. Its weight distribution is faulty, when it comes to carrying letters, and the hope in the future is to have in the New York-Chicago service a machine provided with a distinct compartment. This will do away with the makeshift of using the gunner's cockpit. The reason we have had success in the service between New York and Washington is that training planes and not fighting ships have been available.

Want Low-Compression Motors

"When the New York-Chicago service is resumed we expect to have low-compression Liberty engines, rather than the high-compression military type. This is a point now being worked out. The high-compression motor is designed for altitude work; in carrying the mails we fly at a comparatively low height and so require a motor that functions efficiently at the proper level.

"The Post Office Department feels that it will be possible to use much of the military equipment, though the fuselage and landing gear of available army planes must be strengthened or altered to meet commercial conditions. This work is under way. With regard to motive power, which caused some trouble at the start of the New York-Chicago service, the Post Office Department has on its staff the most competent Liberty motor mechanics and, in addition, has the help of expert mechanics and riggers placed at our disposal by the aeroplane industry.
